SLOW-BURNING or mill construction is simply a special class of timber work. Such a building will have heavy brick walls with the interior columns, beams, and floors of massive timbers so disposed as to present the least possible opportunity for the spread of fire. The columns are made of single timbers, usually square, capped with a corbel or short beam which forms a seat for the column of the next floor above, and supports the cross beams which carry the floor. This corbel may be replaced by a steel or cast-iron cap which is more reliable when the loads are great. The cross-beams are also heavy single timbers, and on these are laid 2 by 4-in. or 2 by 6-in. pieces, set on edge and spiked together so as to form a floor 4 or 6 in. thick, as the case may be. A hardwood wearing floor 1 in. thick is usually laid on this. Note the absence of all joists and any thin projecting woodwork which might easily catch fire. In case a fire should start, the thick floors would tend to confine it to one story, and the heavy beams and columns would burn slowly, thus giving the fire department a chance to put it out before it destroyed the whole building. This construction is only effective, however, when used intelligently, for unless all the many rules for preventing the spread of fire are carefully observed, the result may be disastrous. The roof of such a building may be constructed like the floor, or, if the span between the rafters is not too great, matched sheeting may be used. This is covered with a felt and gravel roofing material or some one of a score of special roofings which will resist the attack of fire. The cost of long timber of large cross-section practically limits the length of beams to somewhere between 12 and 16 ft. This means that in a wide building there will have to be many columns, which take up room and interfere with the arrangement of machinery.

Company Reports

MT. MORGAN GOLD MINING CO., LTD.

The work of this great Queensland concern for the half-year ended November 30, 1912, may be stated as follows:

Ore reserves, high grade, tons	1,433,000
Ore reserves, medium grade, tons	1,997,000
Development, feet	451
Ore mined from—	
Mt. Morgan mine, 450 to 1050-ft. levels, tons	116,277
Many Peaks mine, tons	53,064
Average of Mt. Morgan ore, copper, per cent	3.27
Average of Many Peaks ore, copper, per cent	1.64
Smelter work:	
Ore and other products treated, tons	172,423
Limestone used, tons	34,363
Coke used, tons	20,702
Copper production, tons	5,004
Gold contents, ounces	62,553
Revenue from all sources	$3,075,360
Profit	1,215,000
Dividends paid	480,000

At the mine, development on the 1050-ft. level is encouraging, and diamond-drilling will be started at an early date. In the Many Peaks pyritic orebody, development covered 569 ft. The ratio of this ore to Mt. Morgan silicious ore has decreased from 1.22 to 1, to 0.557 to 1. A new smelting plant to cost $720,000, entirely independent of the present plant, is being erected, having been designed by B. Magnus, general manager, and R. Sticht, of Mt. Lyell. A new power-plant is to be erected, and other necessary works. The reservoirs contain enough water for 15 months.

PORTLAND GOLD MINING COMPANY

The nineteenth annual meeting of the above company, operating mines at Victor and mills at Colorado Springs, Colorado, was held at Cheyenne, Wyoming, on February 3, and the following notes are from the report of the president, F. G. Peck.

The business of the company during 1912 has been satisfactory. The Colorado Springs mill has been reconstructed, the Victor mill enlarged, the No. 2 three-compartment shaft sunk a further 100 ft., a working station cut, and an important orebody opened on this level. Above the amount necessary to pay dividends, the earnings were $85,510. A considerable portion of surplus earnings during the past few years has been devoted to the increase of capacity, and reduction of costs of the mills, and development of the mine, rather than to building up a cash reserve. The Portland mine, like others, has a tonnage of low-grade ore much greater than that of the higher grades. After an expenditure of $500,000 in experimenting, and construction of the Victor mill, the plant is treating 500 tons of ore per day, worth $3.15 per ton, which gives a profit of $1.17 per ton. Its capacity has been increased from 12,285 tons in December 1911 to 14,791 tons in December of the past year, by adding 12 concentrating-tables; 4 Pachuca tanks, 1 Dorr thickener, and 2 classifiers. During 1912 this mill treated 173,361 tons, worth $547,424, upon which a net profit of $203,413 was made. The profits earned by this mill for 1911 and 1912 were 90% of the total cost.

At the beginning of 1912 the chlorination plant at Colorado Springs was being reconstructed into a cyanide plant to treat the high-grade ores, and about the middle of November the work was finished. After a good deal of investigation, 2 Merrill filter-presses were installed, each with 200-ton daily capacity, and they have proved a success.

At the mine, No. 16 level is extremely promising, and a large lode has been opened there. Early in the year No. 15 level, which had been under water since July 1909, was cleaned out, and No. 2 shaft was sunk to open No. 16 level. A cross-cut was driven 145 ft. to the first lode in September, which has been driven on 325 ft., the width varying between 5 and 25 ft. For stoping, 235 ft. has been prepared. The shoot on this level is much wider and longer than on the level above. No. 2 shaft will be sunk to No. 17 level in March 1913. The Roosevelt drainage tunnel has lowered the water 207 ft., and a further depth of 600 ft. will be drained. Regarding the driving of a fourth tunnel, as proposed by Cripple Creek mine-owners, the Portland company is not prepared to help for the present.

The following details are given in the report:

Ore treated at both mills, tons	217,923
Ore treated since April 1894, tons	1,536,185
Value of 1912 output	$ 1,413,766
Value of total production	34,361,897
Cost of mining and milling in 1912	1,091,020
Net profit	322,745
Dividends paid	240,000
Dividends paid to date	9,157,080
Cash and assets, January 1, 1913	338,787
Development in 1912, feet	7,680
Development to date, feet	244,743

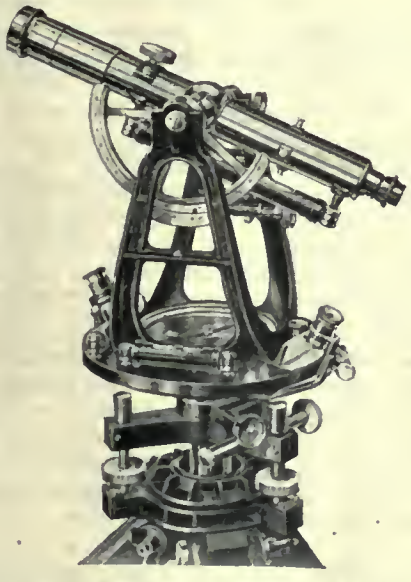
A New Theodolite

A new precision theodolite of improved design, claimed to be especially adapted for triangulation and for city work, and when provided with the necessary attachments, equally suited for mine surveying and for use as a tunnel transit, has just been placed upon the market by Wm. Ainsworth & Sons, of Denver, Colorado.



AINSWORTH, TYPE 'A 3W', PRECISION THEODOLITE.

This instrument has 6¼-in. limb with verniers at 30° with telescope, reading to 10 sec., adjustable reading microscopes, 5-in. vertical arc with vernier reading to 30 sec., 12-in. 25-power erecting telescope, with stadia and solar wires and 3½-in. compass, with variation circle. All graduations excepting compass circle on solid silver.

The improved self-contained 3-screw leveling head has no detachable parts liable to become lost or misplaced, has ample adjustment for taking up wear at every point, and is provided with shifting centre to facilitate setting up.

The finish of the telescope, standard, plates, clamps, tangents, and leveling head is a durable black, protected by a heavy coat of weatherproof lacquer; tangent, clamp, and leveling screws are finished bright and lacquered. The weight of the instrument, complete as shown, is 15 lb., and with heavy split-leg tripod, 25 lb. The instrument can also be furnished with improved non-cramping 4-screw leveling head, edge graduation on vertical circle, any type of solar attachment, interchangeable auxiliary telescope, etc.

Fusible Signal Plugs for Air-Compressing Machinery

Modern methods and equipment both call for treatment which a few years ago would have been thought a needless expense. A recognition of the necessity for making machinery automatic so as to reduce the cost of operation and for eliminating the human factor so far as possible (the cost of attendance) has called for the incorporation of devices safeguarding against abnormal operating conditions. In the air-compressor, for instance, which has reached a high stage of automatism, various contributory causes might produce unduly high temperatures, which should be vigilantly guarded against, and which, so far as the human element is concerned, would not be apparent on the outside. High temperature in air-compressing machinery and its appurtenances such as pipe-lines or air-receivers, may produce various undesirable conditions, such as increased friction and unequal expansion of the working parts, requiring more power to drive and heavy leakage losses, so that the general efficiency of the plant is lowered.

It is essential that lubricating oils be employed in a compressor cylinder to reduce friction and prevent cutting and wear, but it is also a fact that if such oils are subjected to high enough pressure they will catch fire and burn. As interruption of proper cooling, sticking of valves, etc., will tend to induce such temperature, it is imperative that proper precautions be taken. Products of combustion are foul gases, while incomplete combustion results in a carbonic monoxide (CO) gas. One of the most undesirable conditions which might arise is the contamination of compressed air with these hurtful gases. Especially is this true in connection with the use of air in closed workings, such as mines, tunnels, and caissons, where exhaust from drills and other pneumatic machinery is depended on for the supply of fresh air. Instances are on record where explosions in discharge pipes and receivers have been traced to excessive temperature, and while the safety of such apparatus is unquestionable under proper supervision, safety devices looking to the prevention of such danger are entitled to serious consideration from users of compressed air.

Devices of a thermostatic nature have at times been manufactured for this duty, but as they usually involve other complicating apparatus, such as batteries, bells, and wiring, they prove an added burden upon the operating engineer. The Hodges fusible signal plug, which is being placed on the market by the Ingersoll-Rand Co., is intended as an assurance (by giving warning in a positive and unmistakable manner of a rise in temperature to a point which has been previously determined upon as the limit of safety) against the development of excessive strains, or other unnatural conditions. The device as a whole is shown in Fig. 1 and consists of a body formed for readily screwing into a hole tapped for ¼-in. pipe thread in the wall

FIG. 1.

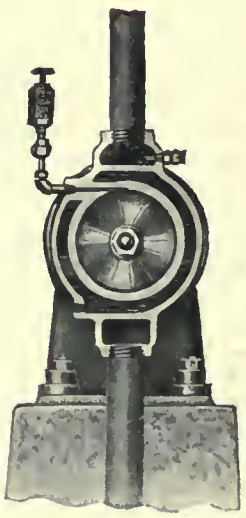


FIG. 2.

of the apparatus to be protected, an ornamental cap, and a removable stem containing the safety element.

The whole device presents a neat appearance when in place, and, as there are no movable parts, no attention is required by the operating engineer. The material used is mostly brass and copper, and is therefore unaffected by atmospheric conditions. Fig. 2 shows the device in place in the discharge space of a single-stage compressor. With this device in place, a rise of temperature to a point for which the safety element is set melts it and opens a minute passage through the stem to the head, allowing a small amount of air to pass, producing a distinctive whistle that cannot be overlooked by anyone in the vicinity; and this will persist until such time as measures have been taken to reduce the primary cause of the threatened trouble. It is then but a moment's work to replace the plug with a new one, and the machine is again properly protected against a similar recurring danger. The removable stem containing the safety element is easily replaced, and a few of these carried in stock will provide protection to a plant of considerable size.

Users of compressed-air machinery taking cognizance of

the simplicity of this device and its insurance against damage can readily understand that it forms a very desirable addition to compressed-air equipment and should be found at every point of possible danger throughout the plant. The manufacturers supply these signal plugs in two types with a 350° and 500° blowing point, respectively. The 350° plug is suitable for use in the discharge pipe of a single-stage compressor working at 40 lb. gauge pressure, in the discharge side of a two-stage compressor working at 100 lb. gauge pressure, or in the discharge side of a three or four-stage compressor delivering air at 1000 lb. gauge pressure. The 500° plug is for use in the discharge pipe of a single-stage compressor working at 100 lb. gauge pressure.

Commercial Paragraphs

C. E. Heald has succeeded A. Van der Naillen, Jr., as manager of Heald's Engineering School, San Francisco.

The Ridge Roasting Furnace & Engineering Co., with offices at 62 London Wall, has been organized to acquire the patents in roasting, calcining, and drying furnaces of H. M. Ridge.

The Taylor-Wharton Iron & Steel Co. announces that it has moved its Western sales office from 203 Mills building, San Francisco, California, to 504 Newhouse building, Salt Lake City, Utah.

W. E. Hardy, formerly manager of the Diamond mechanical branch at New York City, has succeeded I. R. Bailey as sales manager of the mechanical rubber goods department of the Diamond Rubber Company.

The Washington Iron Works, Seattle, Washington, is installing a three-ton Girod electric furnace in its new foundry, together with complete steel foundry equipment for the manufacture of high-grade steel castings. This will be the first electric steel-casting plant on the Pacific Coast.

At the recent annual stockholders meeting of the Riblet Tramway Co., of Spokane, Washington, the following officers were elected: B. C. Riblet, president; R. N. Riblet, vice-president; W. S. Riblet, treasurer; John Clark, secretary. R. S. Riblet and W. S. Riblet were formerly in the tramway department of A. Leschen & Son's Rope Co. W. S. Riblet will have charge of the British Columbia business, with offices at Nelson.

The Hess Flume Co., 2166-76 Fifteenth street, Denver, Colorado, announces the purchase of the Maginnis flume patents, covering both the Maginnis standard flume and the Maginnis smooth interior flume, together with the business, stock, and good-will of P. Maginnis, of Kimball, Nebraska. The Hess company will continue the manufacture of both the Maginnis flume and the Hess flume at both its Denver and Canton, Ohio, factories.

The Union Construction Co., San Francisco, manufacturer of placer gold and tin dredges, has completed arrangements with Fraser & Chalmers, Ltd., of London, England, whereby the latter will act as the representative for the construction of dredges outside of the United States and Alaska. The Union Construction Co.'s corps of engineers has had experience in not only the designing but the operating of dredges, and will act as consulting engineers in this work for Fraser & Chalmers.

The H. W. Johns-Manville Co., New York, has recently put on the market 'J-M High Temperature Cement No. 31,' which it is said can be used practically whenever working temperatures range between 1500 and 3100°F. This new material is a dry powder mixture composed of asbestos and other materials of secret preparation. It is mixed with water to the proper consistence (say about 18 to 20 lb. of water to 100 lb. of powder) for working like mortar or tamping around molds. When used for setting up firebrick for boilers and furnaces, lining and roofing furnaces of various kinds, or molded into door jambs, lining fire-doors, repairing side-walls of furnaces, making stay-nut caps, etc., it has considerable mechanical strength. When air dried it will withstand a crushing strain of 883.5 lb. per square inch. It vitrifies at the comparatively low temperature of 1418°F., and has a high melting point (3182°F.). Being semi-acid in character, it can be used with chrome bricks, silica bricks, or fire-clay bricks. It is claimed that experiments conducted with this cement show that it can be successfully used in building doors of angle-iron framework without backing, or for making one-piece linings for gas or oil-burning crucible furnaces.

The Western Electric Co., New York, reports that its sales for 1912 will be between 71 and 72 millions, which is slightly more than in 1906, the previous largest year in the company's business. The increase has been in American sales outside of the Bell system, which have increased about 100% over 1906, and in European sales, which were the largest in the company's history. The results have been accomplished by an energetic selling campaign in the face of increased and increasing competition. The company is now selling to upward of 30,000 customers in the United States alone. The board of directors has established two additional vice-presidents in the company's organization, and has appointed to these newly created positions Gerard Swope, general sales manager, and A. L. Salt, general purchasing agent.

The Traylor Engineering & Manufacturing Co. has recently closed an order with the Granby Consolidated Mining, Smelting & Power Co. for its entire smelting equipment for a new 3000-ton copper-smelting and converting plant to be erected on its Hidden Creek properties at Anyox, British Columbia. This consists of three complete blast-furnaces, 360 in. long by 50 in. wide at the tuyere zone; three Great Falls type 12-ft. converters; molding machines for both low-grade matte and copper; complete sampling mill and accessories; large initial crushing plant for the mines; complete furnace charging-car system. It is claimed that this is one of the largest individual machinery contracts placed in a number of years. This machinery is expected to be completed and shipped some time in April or the middle of May, and it is reported that the Granby company expects to have the plant running in September or October of this year.

The Dodge Manufacturing Co., Mishawaka, Indiana, announces that the Dodge 'Standard' iron split-pulleys are now being made without set-screws and with the bushings split ready to put on the shaft. Many tests under actual working conditions have demonstrated that the pulley is held fast to the shaft with absolute security by compression alone. The hub bolts are large in diameter, and the clamping power therefore is much greater with these pulleys than any other type. This makes set-screws unnecessary, and as they are an element of danger, projecting as they do from the hub, they have been, in the interest of safety and efficiency, eliminated. All bushings for 'Standard' split iron pulleys will be split, clearance for clamping being provided, and the halves of each bushing wired together, bearing a tag showing the shaft size. Also in the interest of safety, all regular made-to-order Dodge solid iron pulleys and iron-centre wood-rim pulleys, rope sheaves, etc., are being fitted with headless set-screws which are concealed below the surface of the hub.

Catalogues Received

Allis-Chalmers Co., Milwaukee, Wisconsin. Bulletin No. 1631, 'Hydraulic Turbines.' 32 pages. Illustrated. 8 by 10 inches.

Chicago Pneumatic Tool Co., Chicago, Illinois. Bulletin No. 34-F, 'Class G Compressors.' 28 pages. Illustrated. 6 by 9 inches.

TABLE OF CONTENTS

EDITORIAL

NEW districts yield new names at times. The *Rochester Miner* reports a college girl visitor as being "greatly pleased with the formation, particularly these corruptive rocks."

CANADIAN mining engineers will enjoy next week another of the annual gatherings that have made the Canadian Mining Institute notable for good fellowship as well as technical interest. The program announced for the meeting at Ottawa, March 5, 6, and 7, promises an unusually good meeting.

WHETHER use of the parcel post for the sending of gold bricks constitutes an offense sufficient to justify a fraud order is being seriously debated in our office. We reserve till another number the telling of the tale, but announce now in deep sorrow that we have been 'gold-bricked' by friends.

GEOLOGISTS in Canada are offering an extremely attractive program of excursions in connection with the meeting of the International Geological Congress at Toronto, August 7 to 14. Opportunity will be afforded visitors to see the country from Louisburg to Dawson under most favorable circumstances. The Canadians have established an enviable reputation as hosts, and visiting geologists may feel sure that their time will be well spent. While the excursions are, properly enough, offered only to accredited geologists, the Congress itself is open to all.

AMONG papers read at the New York meeting of the American Institute of Mining Engineers was one by Messrs. Chase Palmer and Edson S. Bastin, of the United States Geological Survey, that is of special interest to students of ore genesis. Messrs. Palmer and Bastin have been studying the materials that precipitate gold and silver from solutions, and they find that the metallic sulphides have large power in this direction. Chalcocite proves to be especially efficient, and this affords a ready explanation for the large amount of silver commonly found in veins rich in chalcocite, as at Butte.

COLORADO has maintained a tradition that every decade would witness the finding of a new and important district within that state, a tradition well sustained by several decades. Since Cripple Creek came into being, however, this cherished tradition has seemed likely to go the way of that maintained by the man who went to church regularly—on Easter, but had missed the last two. Discovery of rich silver ore in Eagle county, as announced in our news columns, has especial interest in that it possibly heralds the coming of the longed for new district. Friends assure us that the find is genuine and important.

PANAMA-PACIFIC EXPOSITION affairs seem to make good progress so far as money and buildings go, but we are less certain as to exhibits, at least in mining. So far as public record goes the directors have made no progress in the matter of choice of a commissioner of mines and mining. No one seems to know why. Gentlemen of the Board, the miners are anxious and willing to help, but must know to whom to report. Why not act?

PARTITION walls have always two sides, and it makes a deal of difference whether you gaze at the smooth white finish of the side toward the company office or the rough unfinished side where the plaster has oozed through between the lath, that faces the men's quarters. There are managers who see right through lath and plaster and deep into the hearts of men, and such gifted ones find success easy, for mining, as every other human activity, deals with men as well as materials. Too many managers understand mathematics but have never mastered the intricacies of the human equation. Such men need a guide if they would see not, 'how the other half lives,' but what they think and feel. To such, the paper on mine administration that we print this week will be especially helpful. The author is a genuine miner, one who has worked underground from boyhood and who is working now in the stopes. The point of view that he takes is that of the miner, illuminated with knowledge that has come from experience, travel, and study. The touch of exaggeration is balanced by the play of humor, and the whole portrays excellently the miner's cheerful toleration of a certain type of mine superintendent, a type, by the way, that we hope to see become extinct.

Agitating With Solution

Agitation of slime has received a good deal of attention, and there are a number of methods in use which have been described from time to time: but the system of continuous agitation with barren cyanide solution, as described on another page of this issue by Mr. C. F. Spaulding is new, economical, and does the work of agitating, washing, and decanting in one operation. The process has been tried at Parral, in Mexico, and is now to be used in a 100-ton plant in Oregon. Mechanical and compressed-air agitation is fairly expensive, and the solution agitation takes only one-third of the power required by the former methods. Any existing plant, in which Pachuca vats are used, can be converted for the new system at low cost. Instead of air being used to circulate the slime, solution may be pumped into the transfer pipe, the pulp diluted, its specific gravity lowered, and it then rises in the pipe as in an air-lift. By means of a small vat fitted in the agitator, the slime is made to settle, and the clear solution is decanted off, while the thickened pulp is again elevated by barren solution. This going on continuously, the barren solution replaces the metal-bearing solution as soon as it settles. When the final wash is low in value, the charge is complete. The decanted solution flows to a clarifying vat or filter-press of some kind, and is then precipitated, each agitator having a complete set of clarifiers and zinc-boxes. Unless the ore being treated contains a large amount of colloidal matter, a clarifying vat should suffice. The process is simple, and labor costs should be reduced considerably. Where applicable it affords a means of avoiding the use of vacuum or pressure filters. Mr. Spaulding has not patented his idea, which is somewhat refreshing. We hope that his article may lead to discussion and that the process may find extended application. As has been stated before, the chief weak point in all decantation processes is the quantity of solution which must be discharged with the pulp. Where this can be kept low in value and in cyanide the losses may be kept down to where the process is economical. It is a matter requiring careful study in each case.

Possible Competition in Nickel

Nickel was for many years a drug on the market. Careful work and expanding industry have led to its adoption for new uses until it is now in fair demand. In the form of monel metal it finds especially wide use, and the world's production has doubled in the last decade. Of the present smelting capacity, approximately one-half is in the United States and Canada, and the other half is divided among Germany, England, and France. The world's chief producer is the International Nickel Company, having mines at Sudbury in Ontario. The Mond Nickel Company owns mines adjoining and is now building an enlarged smelter at Coniston. The chief opponent of the International, though, is Le Société de Nickel, with mines in New Caledonia and refineries in France. This company is controlled by the Rothschilds and for some years there has been an amicable arrangement between the companies for division of territory and trade. With the growth of the latter the dominant position has come to be worth fighting for and there are signs suggesting that a fight is impending. Canadian papers have announced that Mr. F. S. Pearson, acting for the owners, has sold to the Rothschilds the nickel properties developed by Messrs. M. K. O'Brien and J. R. Booth. These properties are on what is known as the north range at Sudbury and the best known is the Murray mine. While the ore is lower in grade than in the Creighton and other mines on the south range, it is workable, and systematic diamond-drill work is said to have proved four million tons. It has been known for some time that the New Caledonian mines were failing and that the French interests found competition with the International difficult; presumably the purchase of the Booth-O'Brien properties is to give the French refiners an assured source of cheap ore. Incidentally the American Smelting & Refining Company has been studying the Sudbury district for about a year and is reported to have made an offer for the properties just sold. That concern is rapidly adding to its lines of production and thus broadening the basis of its business. If, however, the old compact between the International Nickel Company and Le Société de Nickel has expired and a contest impends, the nickel business is no field for an innocent bystander.

Gold Production

By George F. Becker

*Historical study of the relative values of the precious metals and of their purchasing power has convinced me that chemical or metallurgical invention almost completely controls the relative values of gold and silver, legislation exercising only an evanescent influence; while the purchasing power is as a rule and under stable economic conditions only about the average cost of extraction. In less alluring industries there is usually a net profit, but much gold and silver is produced at a loss endured in the hope of better developments; and vast amounts of money are spent in almost fruitless search for profitable ores. It is probable, however, that in the Transvaal at the present time there is a net profit on the gold production, because of the regularity of the wonderful Witwatersrand deposit.

The average rewards of mental and physical efforts in fundamental industries for any considerable period of time must be nearly the same, for otherwise the most remunerative occupation would attract an inordinate proportion of workers. Among these rewards, however, must be counted pleasurable excitement and comfort as each of us is aware when choosing a field of activity. Here the personal equation comes in; the adventurous life and gambling chances of a gold miner appeal almost irresistably to men of a certain temperament, while unwashed crowds and cheap shows fascinate the predordained inhabitant of the slums.

Hence improvement in the technique of gold extraction, attended for the moment by increased profit, must soon be followed by increased wages and prices in other occupations in order that the balance of industry may be preserved. We cannot eat gold.

I look for a decided increase in the production of gold in the Russian Empire within a few years through the introduction there of modern methods and machinery. On the Rand, too, as I understand it, the policy is to press production to the utmost, and this will doubtless result in a considerably greater production for a few years. The world's production may rise within five years to something like five hundred million dollars annually.

Ten years from now the Rand deposits now explored should have passed their greatest productivity, and perhaps the Siberian fields already known will have reached a maximum output. All analogy indicates that South America and Africa must contain unexplored goldfields of importance, and progress in discovery is as likely to exceed as to fall short of the exhaustion of known auriferous areas.

Chemical invention will not cease, but the cyanide process is so inexpensive that it is difficult to conceive of an undiscovered method of extraction which would be a very great economic improvement upon it. Nevertheless, the average expense of gold extraction will diminish. There is a strong tendency at present to reduce costs by systematic improvements in mining and milling; by the study of economy in small things the aggregate of which is great. The effect will be to render ores of lower grade available, and of these there are known to be vast quantities. Higher wages will be offset by the increased use of machinery.

I know of no more permanent standard of value than ordinary cattle in an agricultural region. The ox is good to work, can transport himself to market, his flesh, hide, horns, hoofs, and bones are marketable; he represents a fairly definite quantity of available potentialized energy accumulated by the elementary ancient and unimprovable process of digestion; he and his sister never go out of fashion and they make no factitious demands upon their master. In ancient Egypt, 90c. in gold would buy an ox, and the fortune of a Croesus had a purchasing power thirty or forty times as great as the same number of talents would possess at the present day.

Apart from abolishing the artificial enhancement of prices through a protective tariff, the plain way to a reduction of the cost of living is to follow the example of the gold industry; to improve, intensify, and systematize the process of production.

Potash in Nevada

Some significant results have been obtained from the potash explorations of the U. S. Geological Survey in Columbus marsh, on or near the line between Esmeralda and Mineral counties, Nevada. Coaldale is a railroad station at the southeast corner of the marsh, and the Tonopah & Goldfield railroad skirts the eastern margin of the marsh itself. Columbus marsh is a broad mud plain with a rough hummy surface. Little salt shows on the mud except about the margins of the plain, where some borax-producing plants were situated in the earlier days of the borax industry. A small area about the margin of the marsh was located for borax a good many years ago, and a part has been patented. Columbus marsh itself comprises an area of about 35 or 40 square miles, roughly elliptical in outline, being about 9 miles in longest dimension from north to south and 6 miles or more in width. Shore terraces at heights of 70 to 75 ft. above the flat testify to the presence in this basin of a prehistoric lake.

During 1911 the explorations of the Survey geologists with hand-drilling apparatus were carried into Columbus marsh and six holes were sunk to depths ranging from 32 to 50 ft. The drilling was done by Charles E. Watson under the direction of Hoyt S. Gale. It appears from analyses made in the laboratory of the Survey at Washington that the average content of a 20-ft. section of the core obtained between the depths of 18 and 38 ft. consists of 20.59% potash in the water-soluble portion of the sample. These samples averaged 5.96% water-soluble salts in the dried mud and sand as received at the laboratory. Such muds, therefore, contain nearly 6% of soluble salts, of which essentially one-third (32.57%) is potash if the salt is figured as the chloride. It should be emphasized, however, that all these mud samples were brought up through saline waters, also derived from corresponding strata, through the rotated casing used in drilling the well.

Erection of MacNamara Head-Frame

By HERBERT HAAS

As a supplement to M. W. von Bernewitz' article in your issue of January 25, on the mill designed and built by me for the MacNamara Mining Co., the following description of the erection of the new head-frame may interest your readers.

In order to supply the mill with a larger tonnage than had been previously mined, and to carry on more extensive development on the 800 and 700-ft. levels, the hoisting from all of which had to be done through a single 4 by 4-ft. compartment, it became imperative to increase the hoisting speed as well as the load. This would have taxed the old head-frame beyond its safe carrying capacity. Inspection further developed that the sills and portions of the old structure had rotted, and that all of the frame members were badly twisted and had checked from continued exposure to the elements, the frame being nearly ten years old. The hoisting capacity of the winding engine, which was a slow speed, double reel, geared 10 by 16 in. double-cylinder steam engine, had to be increased. This was done by electrifying the hoist, the speed being increased by adopting a proper gear ratio and suitable motor, at the same time that the net hoisting capacity was raised, by the use of a heavy counterweight. The connecting rods and eccentries with reversing links were disconnected, and one of the crank discs was provided with a cast-iron cut-gear ring, which was bolted to the disc. The steel pinion, keyed to the armature shaft of an 80-hp. Westinghouse variable speed type W. S. induction motor, engaged the spur-gear ring, two speed reductions being used with the electric drive.

Use of Counterweight

To reduce 'peaks' during starting, acceleration, and toward the end of a trip when the hoisting speed would be the highest, as well as to reduce the power required for hoisting and the size of the motor, a counterweight of 4000 lb., which is considerably greater than the weight of the empty skip, was placed in the manway compartment, a narrow space of which was portioned off for the counterweights and guides. The skip was designed as a 35-cu. ft. self-dumping vertical car, holding about 3000 lb. of ore. The changed hoist was designed for an average hoisting speed of 800 ft. per minute, and a maximum of 1000 ft. The head-frame had therefore to carry rapidly changing loads upward of 11,000 lb., which was beyond the capacity of the old structure. A new head-frame, considerably higher, was therefore designed, to accommodate the dumping cradle for the skip; and ore and waste-rock bins were built into the frame structure, into which the skip dumps automatically.

A Photographic Record

The accompanying photographs illustrate the method used for erecting the frame into place. In designing it, it was intended from the start to use the old frame and steam-hoist to raise the new frame in place. This was so proportioned that it would go over the old frame; the concrete foundations for the new frame sills were placed along the outside of the old sills, and the new front posts outside of the old ones. The entire head-frame was first carefully framed, then joined, fitted, bolted, and marked; and then disconnected again. Fig. 1 shows the old head-frame. Fig. 2 shows the front posts and bridge tree, sheave platform timbers, and knee bracing, all framed and bolted, supported on false work. For this, use was made of the two lowest post bents of the future ore-bin for the mill. To support the end of the structure, two 4 by 8-in. props were put underneath, in the manner clearly shown in the photograph. Fig. 3 shows everything in readiness for hoisting the front portion of the frame in place. A 1-in. manila line was tied to each post at the top below the cap, and a third and fourth line were tied respectively a little farther down. The first two, or back lines, were used to hold the frame from going over too far and beyond its vertical position when being hoisted in place, the left and right line to prevent a shifting of the frame laterally. The foot of the posts rested on the new sills, which were permanently bolted to the concrete foundations. One corner of the post tenon was directly over the mortise in the cap, which was cut into the sill to receive the foot of the post. The other short side of the tenons had been rounded off slightly at the edge, so that

they would enter the mortises when the posts were being hoisted into position. Back of the mortised caps, timbers were placed horizontally on top of the sills, and a piece of steel plate was wedged between the foot of the new posts and the butt of the horizontal timbers, which absorbed the resulting pressure exerted during the beginning of the raising of the posts. The steel plate was well oiled, to decrease friction while the posts were being fulcrumed into the vertical position.

Arrangement of Rigging

The new frame is 73 ft. from top of sill to top of cap. It was figured that the most favorable point at which to attach the rope slings with which the frame was pulled into position would be about 45 ft. above the foot of the posts. A 1½-in. manila rope sling was tied around each post, and a 2-in. manila sling was fastened to the smaller slings. The shackle of the flat wire hoisting rope was secured to the large sling. Of this, as much as was available was fed out, in order to divide the pull equally between the two frame legs and secure the most favorable direction of pulling force. This sling, forming an acute triangle under tension, can be seen in Fig. 4. and Fig. 5. Timbers 6 by 8 inches in size were bolted to the back of the old frame posts, one near the cap and a second one farther down, the ends of which projected beyond the sides of the old frame posts and served to arrest the posts of the new frame. A notch, the width of the sheave wheel, was cut out of the old cap, so that the hoisting rope would get free after passing through tangency to the sheave. In Fig. 2 a carpenter can be seen cutting this notch. The weakened bridge-tree of the frame was reinforced with braces which allowed the rope to pass unobstructed.

Calculation of Stresses

The entire evolution through the different stages of the raising of the frame was first drawn out on paper, and the stresses the frame, chiefly the posts, would have to withstand, were figured. The weight of the structure to be raised was estimated to amount to 7000 lb., but because of the flat position of the frame, and the consequent unfavorable direction of the rope pull at the start of the lift, the resultant pull was figured to be nearly twice the weight of the frame, which pull decreased with a shifting in the direction of the applied force as the frame was being lifted into position.

It was first tried to raise the frame with the steam hoist singly, but this proved of insufficient power. The second, or 'running over,' rope was therefore passed over the other sheave (the regular hoisting sheave), the cage was attached to it and loaded with about five tons of scrap iron and sacks of cement. About 45 ft. below the collar of the shaft a few sets were placed across the wall plates, the distance being so figured that the cage would land on this staging shortly before the new frame would be in its final vertical position.

Method of Work

When everything was in readiness, three men were stationed at each mooring or guy post, and the signal was given to the hoisting engineer. He opened the throttle full, the frame began to vibrate and then swing around its toes and rise rapidly into position. When it was at an angle of about 75°, the engineer stopped hoisting; the men holding the rear guy-ropes not being able to feed them out fast enough, the lines became taut. A few seconds later the front legs were leaning against the ends of the timbers bolted to the old frame, to which they were securely lashed. In Fig. 4 can be seen a small cloud of dust, caused by the falling of the 4 by 8-in. props temporarily suporting the end of the new structure, which props fell when the frame was raised. Fig. 5 shows the frame in position.

Time Occupied

The work of building the staging, placing the frame on it, joining, bracing, and bolting, and then raising it, was all done in one day, October 16, 1911. Fig. 6 shows the progress of erection the next day. Fig. 7 shows the erection and placing into its splice the last third of the back leg, on October 18, 1911. With the exception of the diagonal braces, all this work was done in three days, which shows good work and excellent framing.

Mine Administration and Mine Bosses

By A Miner

A layman upon perusing the columns of the current mining literature would probably gain the impression that those who occupy the executive positions at a mine are a superior class of knights and courtiers, all possessed of marvelous intelligence and stupendous ability. Such phrases as "winning the precious metal from the bowels of the earth" and "the mining engineer matching his ability with the forces of nature and the 'everlasting rocks'" have a magnificent sound. One might picture the valiant superintendent, always a mining engineer, seated in his office, knowledge and ability personified, information oozing from every pore, every problem mastered, and every feature indicative of a master of the situation. The foreman, another mining engineer, but with less experience, enters for his daily orders, and receiving them in a few curt decisive words departs to transmit them to the shift-boss, an intelligent fellow, who is awaiting them at the shaft. The shift-boss, in turn receiving the orders, steps upon the deck of the awaiting cage, signals the engineer with a majestic motion of the hand, and is promptly lowered into the depths where he proceeds, according to instructions, to send forth enormous quantities of pay-ore. Truly the administrative organization of a mine presents an imposing appearance—on paper.

To the miner who has spent a matter of twenty years in the mines, working from the iron mines of New York to Cananea, and from the phosphate mines of Florida to the Klondike, this organization presents a different appearance. Long experience has familiarized him with the different officials until, when he strolls into a strange camp in search of a job, no inquiries are necessary. He has met so many of each that he can always recognize them without any description.

The Shift Boss

Probably of all species of mine official the easiest identified is the shift-boss—he always wears a No. 14 shoe and his hair grows clear down to his eyebrows. However, the shift-boss is not chosen for the position on account of his looks. His chief characteristic is his vocal ability. He always speaks two languages, both of which are thoroughly understood by the miner; one of them is a growl, the other, a grunt. When he makes his first trip of the day through the mine you—if you are a miner—always get a growl. On his last trip, if you have done about as much as two men ought to do, you get a grunt. If you have done any less than this you draw another growl. I have worked for about three hundred shift-bosses, and they are all alike. If any were different they would be promptly 'canned' by the foreman.

The foreman can be distinguished by his dress as well as by his language. He always apes the superintendent in dress and is always swearing at the shift-boss. That's what a shift-boss is for in the foreman's estimation—that, and to be made the goat for all blunders. The foreman gets his job in a peculiar manner. The superintendent, being a mining engineer, always wants to learn a little mining when he gets out of the School of Mines, so his father, a stockholder, gets him a job in the mine where he is put to work with Pete, the miner. Pete earns his living as a miner because, as a rule, he knows no other way. He does not consider working in the mines in the light of a vacation, and he knows that in most mines two men are supposed to do two men's work. Consequently, when he draws a mining engineer for a partner, he realizes that he has his choice of two methods of procedure. He may either do two men's work or quit. Usually the condition of his finances makes it more diplomatic to pursue the former course, and he resigns himself to fate. When, after about three weeks, his partner, through his father's influence, gets a position as superintendent, Pete is rewarded by being taken along as foreman. And be it said to his credit, Pete has built up a reputation for many a superintendent.

The Superintendent

The superintendent can be recognized in many ways; so many, in fact, that it would be useless to attempt to enumerate. His dress would indicate that mining camp life is one perpetual masquerade ball, and he acts like the shift-boss looks. He is selected for the position because he is the nearest relative of the president or some stockholder who has given indication of an infinite capacity for interfering with his own business. Then, too, being a mining engineer, he has a headful of intellectual chop suey accumulated at the School of Mines where he thinks he received his education.

His first move on 'assuming the superintendency' is to change all of the methods previously used at the mine to conform to the methods of the mine where he received his three weeks 'practical experience.' This usually lasts for about a month, by which time Pete is able to persuade him that the methods used in a 14-ft. vertical vein of copper ore are not applicable to a 3-ft. vein of gold ore dipping 45°. As it is undignified for a superintendent to recede from a position once taken, he never changes his methods. He simply 'modifies' them, but in most cases the modification is of such extent that he gets right back to the methods originally used. He seldom tries to apply any of the methods he learned at the School of Mines, because, with three weeks' practical experience, even a mine superintendent will learn enough to not try to apply those methods to actual mining.

Importing Men

Another favorite 'stunt' of the new superintendent is the importation of men from that wonderful mine where he discovered Pete and where he learned all about mining in three weeks. In all of his experience those are the best miners he has ever met; so

he promptly sends back for a dozen or so. It never occurs to him that a miner in the 14-ft. vein where 3-in. piston machines are used, may not be equally at home with a single-jack in a flat vein of gold quartz, nor does he consider the fact that the best miners will not leave Leadville or Butte or the Coeur d'Alene, where the accommodations are good, to work for the same wages in a 'bunk-house camp.' He thinks, because he has never been in such a place before, that the miner is equally ignorant. So when the new crew arrives he has Pete 'fire' enough of the home talent to make room for the imported men, and later discovers that those he fired are better suited to his conditions than the imported stock. He frequently learns, too, that the whole community is sore on him for 'canning' the men who were considered by the previous management to be able miners.

Changing Methods

A change of methods is frequently advisable, but is best made by a miner who has had experience in both methods and not because the methods to which the change is made has been used advantageously in an entirely different kind of deposit. The importation of men in large numbers from any camp is very seldom a success. These two mistakes have been made by every young School of Mines superintendent who has had charge of a mine in the last forty years, and they are being made just as often today as they ever were. It is really astonishing how much damage can be done by three weeks 'practical experience.' It often requires years to overcome the evil effects of it.

Another favorite stunt is for the young superintendent to take charge of the mine itself. After fifteen or twenty years he learns that the proper one to direct the actual operations of a mine is a miner, but he seldom learns it in less time. So he 'takes personal charge' of the mine, retaining, however, the faithful Pete in order that he may put in his reports such expressions as "my foreman, acting under *my* orders," did so and so. "My foreman shall be immediately instructed to," "my foreman made a mistake and caved the stope." In the reports 'I' gets the credit for everything correctly done, and 'my foreman' makes all the 'bulls.' That's part of a foreman's duty.

Personally Managed Mines

If there ever was a mine personally managed by a superintendent and made to pay it was a very rich one. I do not believe it was ever done, but if it was, I know from what I have seen them do to ordinary mines that it took a rich one to stand it and pay dividends. I have worked for forty or fifty mine superintendents and have yet to see one who is capable of taking 'personal charge' of a mine. As a matter of fact they usually only think they are in charge. In 90% of the cases Pete is actually directing the work, and Pete must be a pretty able miner to make a mine pay when handicapped by one of the 24-carat boss-heads that is so frequently inflicted upon him.

Somehow, it never seems to occur to the 'super' that there is anything for him to do except interfere with the operation of the mine. He seems never to think that he might look into conditions around the bunk-house or boarding house. He thinks when he has provided a kennel in which a miner can spread his blankets (for which the miner usually pays $1 or $2 per month), and a boarding house compared with which a Salvation Army soup-house resembles a Waldorf-Astoria, he has done his duty. He can always find time to drop down into the mine and ball things up, but he never has time to visit the kitchen. That is about the only place around the works where he cannot make things any worse, so he never goes there. Of course, he will not live on the common dollar-a-day grub that he feeds the miner—he has a private table. It looks as though some superintendent would learn that if he does not wish to eat at the same table with the miner, he would better hire a cook of his own than to have a private dining room in the miners' boarding house. Dissatisfaction over the boarding house is a common complaint in any case, but it is less common when the bosses eat at the same table with the miners or take their meals in some other place than the company boarding house. Probably the private table is no better than the other, but the miner does not know it and will not believe it. He is 'from Missouri' when it comes to 'grub'.

It seems, too, that it would occur to some superintendent that a boarding house could be run by some one except a Chinaman, but it rarely does. They all seem to think that the proper food for a miner is 'grub' that can only be masticated by a rock-crusher and digested by an ostrich and that it is much more palatable to him when served by a greasy Chinaman, dressed in overalls and with his shirt-tails out, than if served by clean white women.

The Superintendent's Geology

However, the 'super' has no time to devote to such things. His presence is demanded in the mine where he can get in someone's way. Besides, the miner could not properly extract the ore from the stopes unless it was explained to him how it got in there, so the 'super' must be on the job with the explanation; much of the geology inflicted upon poor Pete and the other miners would scandalize the dear old professor back at the School of Mines. The one feature of the 'super' that appeals strongly to the miner is the fact that no one can stick him on any geological question. His long suit is talking geology to someone who knows nothing about it, and it is really inspiring to hear him discuss 'metasomatic interchange' and 'pneumato-hydrogenic processes' when he has a shoveler for an audience. It is in such cases that he shows himself at his best and he always likes to be questioned on geology and the formation of ore deposits. Some miners, learning this, always have a leading question ready for him when he comes around and during the peroration that follows they enjoy a restful half-hour on a powder box. The 'super' will always stand for your loafing if you will stand for his geology.

The only time one of these 'personally managed' mines is free from the interference of the 'super' is when he has made some mistake that everyone, in-

cluding himself, recognizes. Then he goes down to the office and meditates upon 'lateral infiltration' or reads a book on 'industrial efficieney' for a couple of days while Pete straightens up the mess. I have seen one spend a half-day with five or six men trying to get a 24-ft. pipe into a place the greatest dimension of which did not exceed 18 ft. and, after shouting at and quarreling with the miners until they were all on the verge of quitting, go away and not bother the mine for a week. It may not be believed, but it is a fact, that such men as this draw pay as superintendents of mines. Another characteristic of this kind of superintendent is his mania on the subject of efficieney of labor. How can a man expect to get efficieney out of labor when he insists upon hiring all men himself and when he does not know enough about labor to distinguish between a Japanese dishwasher and a Swede lumber-jack? That inefficieney exists in most mining camps cannot be denied, but usually 95% of it is in the superintendent's office, and it is there that reform might well begin.

Is mining languishing? Undoubtedly—and no wonder. If it were not the greatest of all industries, the scientific mismanagement with which it has been afflicted would long ago have put it in a class with the profession of smuggling Chinamen across the Mexican border.

Litigation Over the Federal Mining & Smelting Company

News despatches from New York have much to say about a suit against the Guggenheims that has been filed in the Supreme Court of New York by minority stockholders of the Federal Mining & Smelting Co., asking for annulment of an alleged unfair contract under which the ores of the corporation are now being shipped to the smelters of the A. S. & R. Co., on a basis much below the present price of lead. The complaint demands an accounting for the difference between the price received for the company's lead since 1909 and the price that could have been obtained in the open market. An injunction is also sought to restrain the Federal company from acquiring more properties, as they must, according to the stringent provisions of the present contract, be operated under its alleged unfair conditions.

Bearing of Litigation

The action is important in its bearing upon the lead industry. The Coeur d'Alene district of Idaho, in which are all the mines of the Federal company, produces about 27% of the total domestic lead supply of the United States and about 48% of the desilverized output. The Federal company accounts for 43% of the Coeur d'Alene output and no less than 12% of domestic lead derived from all sources. Minority interests have also declared their intention of taking the matter before the Ways and Means Committee of the House of Representatives on the ground that arguments presented to that body are predicated upon the definite statement that the smelters pay full New York prices for lead in the ores of the Coeur d'Alenes, while it is charged the Federal contract, which covers a large percentage of the output, provides for settlement at between 50c. and $1 per 100 lb. below that figure. It is argued that since the producer derives no benefit from at least that proportion of the present tariff, there is no good reason to maintain protection at the present levels. Application for permission to appear before the committee has already been made, and United States Senator Simon Guggenheim has asked for opportunity to counteract the evidence by further briefs from producers.

The action involves men of prominence in the financial world. About the time the contract complained of was entered into, in 1905, the Federal directorate included John D. Rockefeller, Jr., George J. Gould, Frederick T. Gates, George W. Young, Peter B. Bradley, and several other financiers of importance.

History of Federal

Since the Federal officials have refused to permit minority interests to inspect records of transactions at that time, and the directors of 1905 will therefore be subpoenaed. Upon the day the contract was signed, the old directors resigned and were succeeded by alleged 'dummies' in the employ of the smelting company. Evidence of the old directors is asked to determine whether they aided the latter to enter into an unfair contract running 21 years, after selling control to the Guggenheims, or whether the contract was entered into upon the authority of the alleged 'dummies.'

Federal was promoted in 1903 by Charles Sweeney, one of the most forceful and interesting of Western mining men, to take over the holdings of the Empire State Idaho Mining Co., which for some years previously had successfully operated properties at Wardner, Burke, and Mace, in the Coeur d'Alenes. Foreseeing that the association of such a commanding financier as John D. Rockefeller would aid in the exploitation of the new company and open wide the public purse, Mr. Sweeney approached the Standard Oil interests with the proposal that they turn over the old Everett smelter and Monte Cristo mines to the new company and take the price agreed upon in stock. The smelter was antiquated at the time and the Monte Cristo mines had failed to respond to expenditure of large sums of money, so the Rockefeller interests accepted Sweeney's proposition and the property was duly turned over early in 1903. At the same time the Rockefeller interests took control of the company's directorate. Subsequently the Guggenheims sought a contract for treatment of the company's ores and, as consideration for a favorable agreement, are said to have paid $600,000 for the old smelter at Everett and the Monte Cristo mines. The former was soon abandoned and the latter sold to a company organized in New York by Sam Silverman. After a few months of desultory work the properties were finally abandoned.

Sale of Mine

Under the direction of Standard interests, production from the Federal mines was maintained for two years at high pressure and, finally, in 1905, the Guggenheims secured control by purchasing something over 9000 shares of common stock from the Standard Oil at a reported consideration of $120 per share, although the common stock was originally dealt out as a bonus with the 7% cumulative preferred. The quotations on common immediately commenced sensational flights, and in 1906 reached a high level of $199 on the New York Stock Exchange, while the preferred ran up to $112.50. At the present time, with production maintained at former rates, the quotations stand at $15 and $39, respectively, representing a loss in value of no less than $19,800,000 since 1906, upon the issued capital of $12,000,000 preferred and $6,000,000 common stock. The control of common stock, which carries all voting and administrative power, is vested in the American Smelters Securities Co., which, in turn, is owned, in so far as voting power is concerned, by the American Smelting & Refining Company.

Terms of Contract

In October 1905, when the first contract, entered into in 1903, had still four years to run, another was prepared to take effect upon the expiration of the first contract and continuing in effect for a period of 21 years thereafter, or until September 1, 1930. It is this contract that is being attacked by the minority interests upon the grounds that it was fraudulent and not in the best interests of the producing company. The question as to whether it was concurred in by the representatives of Standard Oil as a part consideration for purchase of control by the Guggenheims or whether their own 'dummy' directors forced it through at the smelter's dictation after the personnel of the directorate had been changed, is one that will lead to interesting testimony. The contract runs for 21 years from 1909, and calls for settlement for lead at 90% of the lead in the ore at 90% of the New York quotation so long as that quotation remains at $4.10 per hundred pounds or less. If the quotation be above $4.10, then the smelting company and the producer divide the difference. Other contracts in the same district provide for settlement at flat New York prices. Since 1905 lead has been below $4.10 in 9 months and above that figure in 75 months, with an average for the whole period of $4.67. At the time the second contract was made in 1905 lead stood at $4.85, and the agreement therefore entailed a loss to the Federal of 80c. per hundred pounds of lead, or $6.17 on every ton of an average tenor of 42 per cent.

Alleged Excess Profits

The minority interests charge that the sum of $662,000 was lost to the company in this way during the fiscal year ended August 31, 1912, alone, and that the additional loss in the four months of 1912 since the report was issued has amounted to $271,000. It is also alleged that if the present contract be allowed to stand, the smelting company, during the entire life of the contract, will collect no less than $12,600.000 in excess of prices paid by the same concern to rival producers in the same district, besides the sum of $19,947,312 in regular treatment charges at $8 per ton. These figures are based upon production, tenor, and average prices of 1912. The minority also contends that if Federal enjoyed a contract as favorable as those granted to other producers, the company could earn good dividends upon common stock and maintain the 7% dividends on preferred—a rate that was reduced to 6% last year. No dividends have been paid on common stock since the second contract went into effect in 1909, although as high as 17% was previously paid in one year. To these various charges Edgar Newhouse for the A. S. & R., has made the general statement that at the time the contract was made the mining company was as anxious for it as the smelting company, and that it was considered a fair bargain in the interest of both concerns.

Vanadium in the West

*Late in the nineties a dull green sandstone in the steep walls near Placerville, Colorado, was found to be vanadiferous, and although its percentage of vanadium is low, the deposits have become of commercial value owing to the increasing use of the metal and to the large quantities of vanadiferous sandstone available. The known vanadium deposits of the Placerville region extend through a distance of a little more than 9 miles south and east from Brown, a Rio Grande Southern Railroad station on Leopard creek, 4 miles above Placerville, to a point on Bear creek 3 miles south of Newmire. The deposits occur on both sides of Leopard creek, extending with short interruptions to the valley of the river; thence they follow the river irregularly to a point north of Sawpit. Some deposits occur on the east side of Fall creek, extending for a distance of about a mile above the mouth, and others are found on the south side of San Miguel river for a mile or more above Fall creek. In thickness the deposits range from 1 or 2 in. to over 30 ft. From present developments probably only a few thousand tons of ore carrying over 3% of vanadium can be profitably mined, but there are many thousands of tons of vanadium-bearing sandstone which will show between 1 and 2% of metallic vanadium and much more running between 0.5 and 1%. Sufficient ore has been mined in this area, and to a less extent in the carnotite fields 40 or 50 miles to the west, to cause the price to be reduced in the last three or four years from $5 per pound of metallic vanadium in ferrovanadium to $2.50 or less.

The Utah deposits are on the east side of the San Rafael swell, at a place marked on some maps as Tidwell, about 15 miles south and west of Green-river. These deposits are now being worked.

The Sierra de los Caballos lies along the east side of the Rio Grande in New Mexico, and reaches a maximum height of 10,000 ft. at Timber Hill, south of the vanadium deposits. The vanadium-bearing mineral at this place is vanadinite, a lead vanadate.

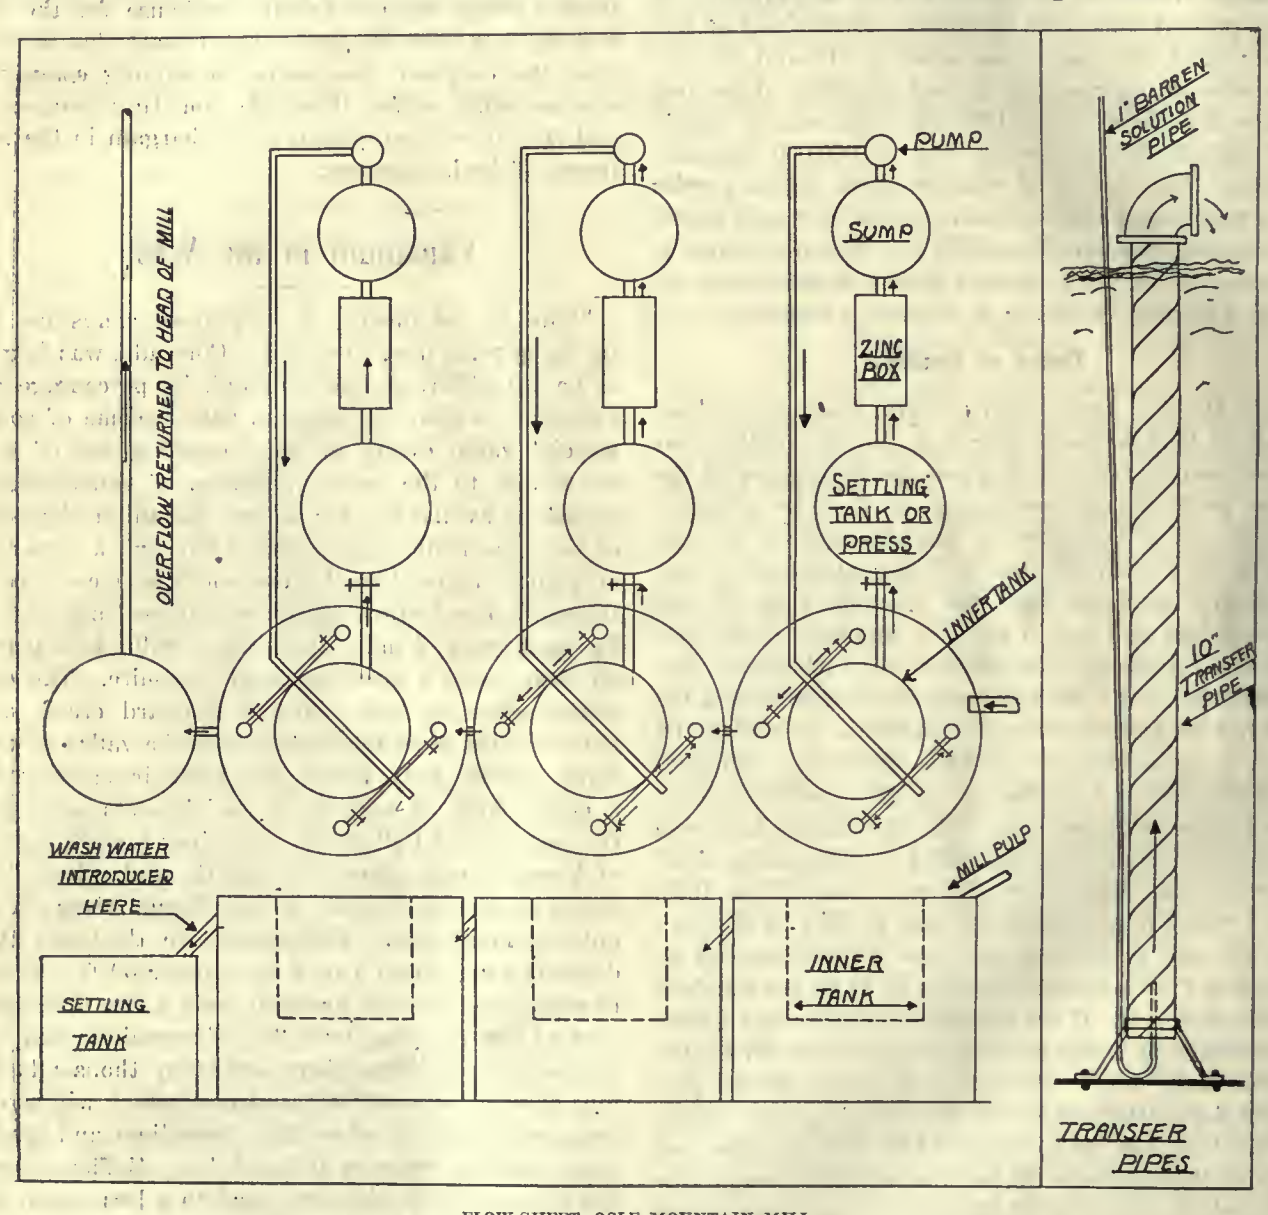
Continuous Agitation of Slime With Barren Cyanide Solution

By C. F. Spaulding

The Ogle Mountain Mining Co., of Oregon City, Oregon, will build a mill this coming summer in which the slime will be agitated by circulating barren cyanide solution instead of air. This mill has been designed from data worked up at the 350-ton cyanide plant of the Veta Colorado at Parral, Mexico, where the plan worked admirably, reducing the tailing 12 to 15 gm. silver per ton and also cutting the time for agitation from 72 to 48 hr. I believe that the better extraction and shortening of the time was due to the displacement of the pregnant solution surrounding each particle of silver by more active barren solution during each passage through the transfer pipe.



FLOW-SHEET, OGLE MOUNTAIN MILL.

In the figure is shown the flow-sheet of the cyanide plant of the Ogle Mountain Mining Co.'s mill which will be from 100 to 125-ton capacity. The agitating-vats are three in number, 20 ft. in diameter, 20 ft. deep, and have flat bottoms. They contain an inner suspended bottomless vat, 10 by 10 ft., in which the slime settles. This inner settling-vat is fitted with baffle-plates to stop the swirling motion of the pulp as it rises from the outer vat.

The agitating will be done through four 10-in. transfer pipes made of spiral riveted pipe and fitted with L's on top, these to be four to six inches above the level of the pulp surface and to point normal to radius of vat. The discharge of the pulp through these L's give a circular swirling movement to the pulp, keeping the bottom of the vat fairly well scoured, and preventing rapid settling of the slime. These transfer pipes will be evenly spaced and 2 ft. from the side of the agitating-vat. The solution, as it settles in the inner clarifying vat, is decanted off through a 4-in. horizontal pipe, passing to a clarifying vat or press, thence through zinc-boxes or zinc precipitation-presses and to a sump from which it is pumped back to the agitating-vat in which it is used for agitation. A centrifugal pump is best for this work as the pressures are low, not over 15 to 20 lb. For the Oregon mill, handling 100 to 125 tons per day, tests show that a 2-in. centrifugal pump

at each tank, consuming not over 5 hp., will displace the pregnant solution in the vat with barren solution every 6 hr.; equivalent to four complete displacements or washes each 24 hr. Each agitating vat is connected with an independent set of inner settling-vat, a clarifying-vat or press, a zinc-box, sump, and pump. Each unit, being complete in itself, will keep the solution from the different vats from mixing. The mill pulp entering vat No. 1 displaces an equal amount, which goes to vat No. 2, and on through the system. The overflow from the last vat goes to a settling-vat. The settled tailing is discharged and the overflow is pumped back to the head of the mill, where it is brought up to strength and again enters the system. The make-up water for the mill can well be added to the overflow launder from the last vat where it will act as a wash water.

The decanting pipe is proportioned in size to the tonnage in the vat and the time in which it is desired to replace the pregnant solution with barren solution. In the Oregon mill the decanting pipes are to be of 4 in., and the agitating pipes 1 in. diameter.

Agitating in Barren Solution

Agitating with barren cyanide solution has many advantages over air-agitation. For one thing, it is much cheaper. The zinc-box for each tank can be arranged so there is not over 12 to 15 ft. drop between the pulp-level in the tank and the solution in the sump. This will give a small head to pump against and should not take over 2½ to 5 hp. To agitate with air takes 10 to 15 hp. to each vat. The cost of piping and zinc-boxes in each case is about the same. The cost of the settling and clarifying-vats and pumps is small. This is more than offset by the cost of the filter-press for the tailing which is done away with. In the second place, the system permits easy manipulation. There is only one valve to regulate for each tank. This is placed somewhere in the decanting pipe. The plant will run for days without adjusting this valve. The valves in the four agitating-pipes are not touched after adjustment. The plant is automatic in action and needs little attention. It costs less to operate for labor, power, supplies, and repairs, than a plant agitating with air and including filter-pressing. One man on a shift should be able to attend to a plant up to 300 tons in size. A third important factor is the increased extraction. The recovery will be materially increased and the time of agitation shortened; due, I think, to the operator being able to carry a more dilute solution and to the displacement of the pregnant solution with barren solution. At the Veta Colorado it was necessary to carry a thick pulp, not over 2 to 1 dilution, because a more dilute solution foamed badly. The best extraction was with a pulp 3 to 1 or thinner. With barren cyanide solution this might be as thin as desired without any foaming. The system also saves the cost of an expensive air-compressor and receiver. The agitating pipe is much simpler, being merely turned up at the bottom and using no valves, rubber sleeves, or complicated devices to stop the flow of pulp into the pipe whenever the air goes off. There is no danger of this happening when using cyanide solution for agitation, since the pipe is always full of solution and the pulp cannot back up in it and clog it.

Absence of Foaming

This passage of the pulp through the transfer pipes is due to two things. The barren solution acts as a jet or hydraulic elevator forcing the circulation, diluting the pulp in the transfer column, it makes the latter lighter than that in the vat. This difference in specific gravity also helps the circulation. It results in a particularly satisfactory agitation, with no fuss, foaming, or troubles of any kind. The flow-sheet illustrated includes clarifying-vats or presses. In some cases where the slime contains a large amount of colloidal matter and it is necessary to crowd the passage of pulp, these may be necessary. Usually, however, with sufficient decanting capacity these will not be needed, though it might be well to put them in, to provide extra capacity for decanting. If the clarifying vat or press is used the inner (settling) vat can be made smaller in proportion and the decanting may be crowded, the clarifying device taking care of any colloidal matter which passes over.

Mr. McKinnery, of Ward, Colorado, who has a plant somewhat on these lines, except that he agitates mechanically and keeps the decanted solution passing through the system of tanks against the flow of pulp, finds that the settling is practically perfect. His extraction on heavy sulphide ore is good. By the time the pulp reaches the last vat and is ready to be discharged, the dissolved gold remaining is so small in amount that it does not pay to use a filter-press. Tests show that in the Oregon plant the dissolved gold in the tailing when ready to be discharged will not be over 8½c. per ton. This can be thrown away cheaper than a filter-press can be put in and operated.

Modifying Existing Plants

An existing plant using Pachucas for agitation can easily and cheaply be modified to use barren cyanide solution for agitation, and it would probably cut out the cost of filter-pressing. In making such a change, build the inner vat 8 to 10 ft. diam., 10 to 15 ft. deep, and construct it from 1-in. lumber, corrugated iron, or any handy material. It does not have to be especially strong or heavy. Leave the transfer pipe in the centre as usual, cutting into the air-pipe a connection from the barren-solution pump, or, better, putting in a separate pipe for the barren solution. Do the settling outside the inner vat instead of inside it as shown in the flow-sheet. That was the system used at the Veta Colorado mill during the summer of 1911. So far as I know, the process of agitating with barren cyanide solution is not patented and has never been used by anyone except myself. I do not intend to patent the process.

Schools of mines in New Zealand have been organized for 27 years, during which time the Government has appropriated for the work nearly $250,000.

Pig iron production of the United States in January was 2,795,331 tons, which is ahead of all other records.

Dressing Western Zinc Ores

By Frank A. Bird

Twenty years ago, except in a few isolated cases, shipments of zinc ore or concentrate from Western states were unknown. No crude ores of sufficient richness had been developed in commercial quantities or where any were known to exist, they were below the then generally accepted limit of grade. Where low-grade ores of zinc, lead, iron, or copper sulphide occurred together, the whole effort was to bring the zinc content as far under the limit imposed by the lead smelter as possible. At first the zinc was allowed to run to waste as tailing; later attempts were made to save this in ponds or to make a low-grade zinc-iron middling which could be piled to await future treatment. Occasionally some zinc smelter risked the freight charges to secure a car of this middling, but always reported negative results. A change has come through the gradual improvement in milling, a better understanding as to the method of treatment at the zinc smelters, and the increasing scarcity of Middle West ores. These factors, helped by a protective tariff, have led to development of Western tonnage, until today zinc ores are commonly mined through the West. Much still remains that the Western shipper should consider if he would better his product and increase his profits. It is surprising how many ores that could be improved are being shipped after imperfect treatment.

Close Dressing Necessary

Unlike lead or copper smelting, where one can speak of a daily capacity of hundreds of tons, zinc metallurgy is one of small weights. The individual retort seldom holds more than 75 lb. of ore. The average furnace, containing slightly more than 300 retorts, must be hand cleaned and recharged every 24 hours. It can be seen how necessary is the production of high-grade ores. With each betterment in grade, resulting in the lowering of undesirable impurities, a larger output and a higher grade of spelter becomes possible. The retorts have a longer life, thus lessening working expenses, and a better price can be offered for the ore.

As in lead or copper metallurgy, zinc ores can also be divided into two general classes: carbonates and sulphides. The 'carbonates' usually contain silicate, and in cases, as that of ore from the Scranton mine in Utah, consist of an almost pure silicate containing some carbonate. 'Carbonate' ores vary in metal content from just above 20% to occasionally over 40%. All usually contain high moisture. As the zinc furnace first drives off all moisture and carbon dioxide, making an artificial oxide, in which form all zinc ores must be brought before reduction occurs, it would be to the shippers' advantage to calcine all carbonate ores. Besides the saving in freight charges on moisture, a reduction in weight of from 20 to 25% occurs, together with an increase in zinc content of 50%. These changes may be represented by the constant factor 1.5409, although this theoretical increase is seldom realized in practice. Silicates, with conditions favorable, should also be calcined, although the theoretical loss in weight, aside from contained moisture, is only 7.5% (water of crystallization). The increase in zinc is represented by the factor 1.0808. In their raw state the hardness of these ores makes them difficult both to prepare for treatment and to distill. They necessitate a higher furnace temperature. Calcining softens them and therefore makes them easier to prepare. It allows the furnace carbon to commence the work of reduction at a lower temperature. This direct benefit should result in a higher price. Looked at from a Western standpoint, calcining is really a fine concentration.

While the zinc smelters will buy ores containing less than 30% zinc, such ores are not desirable and the price offered is not in any way proportional to that paid for 40% ore, which is the basis content for all Western ores, whether carbonate or sulphide. Because of fuel expense, it may not always be possible to treat Western ores before shipment, but with an assured tonnage the following rules are generally applicable: (1) In the case of ores above 30%, at least dry to dust limit and calcine if possible; (2) with ores from 20 to 30%, calcine and raise to a desirable class. For ores below 20%, which are waste today, mix with carbon (run of mine slack coal), blow-up in furnace with light blast, driving off zinc as an oxide, collect this in a bag-house, compress, and sack for shipment. Such treatment would result in a high-grade and desirable smelting product. It is also possible to make an article having a good commercial demand as pigment or filler for rubber.

In a few special cases wet concentration is feasible. The plan adopted by the Yellow Pine in southern Nevada could be used. This includes hand sorting of crude ore on belt, picking out rich lead ores, lime, and other gangue rock, concentration for a lead product, and saving as a commercial zinc product the remainder, which under ordinary circumstances would be tailing. The slime is settled in ponds which also go to the zinc smelter, but separate from the coarse. With the high freight on this ore, $8 per ton, an improvement over present practice would be to oxidize everything or at least dry to 2% moisture.

Calcining Ore

The following designs for calcining furnaces are of a simple and easily built furnace.

The simplest form of furnace resembles a lime kiln, as in Fig. 1. In this $a=7$ ft. 3 in.; $b=17$ ft. 6 in.; greatest bulge at $b=9$ ft. 8 in.; $c=5$ ft. 6 in.: cone $d=3$ ft. 6 in.; $e\,e$ are draw holes; $f\,f$ arches, there can be either two or four draw holes and arches. The furnace should have a refractory fire brick lining. It is filled with alternate layers of 6 in. each, of lump ore and fuel. Drawing every 4

hours, it has a capacity of 25 tons in 24 hours. The fuel required varies between 3 and 6% of the weight of the ore, according to its purity. While this furnace can be made the cheapest in operation, cost and capacity considered, the objections to it are the mixing of all ashes with the ore and the fact that from 15 to 20% only of fine ore is allowable.

A shaft furnace, externally fired, is shown in Fig. 2. In this a=5 ft. to 5 ft. 9 in.; b=1 ft. 8 in. to 2 ft.; a to b (inside height) = 8 to 16 ft.; c is feed

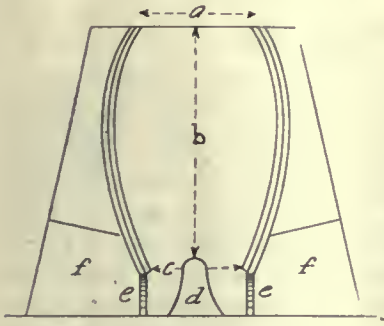


FIG. 1.

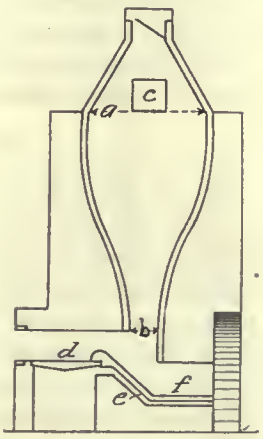

FIG. 2.

door; d fire box. The ash pit being kept closed, air for combustion is heated while passing through flue e under f where the calcined ore is drawn. Doors for d and f are also kept closed. The fireman is provided with hood, stack, and fire-regulating damper. In such a furnace with one fireplace, 5 to 8 tons of ore can be calcined in 24 hours. Coal consumption amounts to 8 to 9% of weight of ore. With two fireplaces 10 tons can be calcined with about same fuel consumption.

A fixed reverberatory furnace, hand worked and grate fired, should be built 40 to 43 ft. long, with a double hearth and single fireplace. The breadth should not exceed 8 ft. Working doors should be placed on both sides 6 ft. apart. The height of arch at the outside should be 1 ft. 4 in. to 2 ft. Incline the floor somewhat toward the flue bridge. With gas-firing the length can be extended to 46 ft. The capacity of such a furnace is 3 to 10 tons in 24 hours, with a fuel consumption equal to between 10 and 15% of weight of ore. A reverberatory furnace with movable chambers may have a length of 42 ft., a diameter of 3 ft. 3 in. inside, and should be lined with refractory brick. Such furnaces revolve 16 times per hour, turning on 8 sets of rollers. Ore requires 6 hours treatment. The fire grate has an area of 10 sq. ft., the fire bridge being tubular and projecting into the furnace. The capacity is 12 tons in 24 hours, and the fuel consumption, 12½% the weight of raw ore. Reverberatory furnaces allow working up all fine ore and crushing the coarse ore to a finer size, thus facilitating treatment. With slight variation these furnaces may be built so as to allow the use of producer gas from either coal or oil. This would usually be more economical. Various other forms of furnaces could be utilized in treatment of ores of this character; most of the large reverberatory furnaces with mechanical stirrers used in oxidizing sulphides may be used with slight modifications. They would give a maximum of output, from three to four times greater than in sulphide roasting, with low working costs.

Preparing Sulphide Ore

Sulphide ores permit similar criticism as to shipments as do the carbonates, although now the Western shippers are more familiar with them, having first made a lead product which the lead smelter penalized for its zinc content, they have learned how to limit the zinc. Today acceptable zinc concentrates are being widely made.

Considerable crude zinc ore is being shipped. Some of this contains excessive moisture and objectionable lead, iron, and copper sulphides. Many of these with treatment would yield valuable by-products. Detrimental silica, lime, and barium sulphate also occur. These should be dressed out. The silica forms silicates with the iron and other bases at comparatively low temperatures which soon run through ('butcher') the retorts. The lime, besides facilitating the formation of slags at low temperatures, forms calcium sulphate while the ore is being roasted. Afterward, when retorting, each part of sulphur combines with two parts of zinc, making zinc sulphide, which cannot be distilled. The sulphur in the barium sulphate acts similarly.

Summary

1. Crude ores should at least be dried and all large lumps crushed. Zinc smelters are notoriously deficient in sampling facilities and the true proportion of large pieces which should go into the sample are often ignored.

2. Ore should be treated by concentration, as coarse as possible, for removal of gangue. Make a clean lead product, if any lead be present, and a middling of zinc-iron or zinc-iron-copper which can be further separated by tube flotation (requiring a large unit), magnetic separation, requiring a slight roast, electrostatic separation, only requiring drying and sizing. At times it would be advisable to use wet concentration following one of the above treatments.

3. In the case of concentrates, clean them further by one of the above methods making marketable products for the lead or copper smelter. Close classification is necessary in every case. The Richards-Janney classifier is one of the many admirable ones. Dry all products to avoid excessive freight charges.

While today the zinc smelters will pay for lead, copper, silver, and gold contained in zinc ores, the deductions are greater than in the case of lead-copper ores and the prices offered are lower. In a majority of cases these metals are below their requirements and are a total loss to both ore producer and smelter; proper concentration would avoid this and benefit the producer.

Coalfields have been discovered in the Belgian Congo, according to a recent report. A despatch from Belgium states that drill-holes over a large area disclose a seam 6 or 7 ft. thick, of a quality satisfactory for steaming.

Copper in York County, Pennsylvania

By M. L. Jandorf

Occurrences of copper in Triassic rocks have been observed in many parts of the world. Some of these can be profitably worked; others are disseminated streaks, sparsely scattered throughout the rocks, and of no economic value. Deposits of this type have been worked in England, Germany, and in the United States, in the states of New Mexico, Idaho, and New Jersey.

During the autumn of 1909, my attention was called to an occurrence of copper ore in Triassic sandstone, along the Bull road, about 5 miles northwest of York, Pennsylvania. The prospect may easily be found in the lower right-hand corner of the New Cumberland quadrangle, between parallels 40°00′ and 40°1′, and meridians 76°45′ and 76°49′. At this point the Bull road is the dividing line between Conewago and Dover townships and passes through a cut exposing about 15 ft. of Triassic sandstone. It may be mentioned here that copper was first discovered in these sandstones as early as 1837. While prospecting was carried on in both townships, an adit was driven into the ridge of Triassic rock in Conewago township, at a point approximately 100 ft. north of Fox run, a tributary of the Little Conewago creek.

The Triassic sandstones at this point form a low-lying ridge, striking northwest and southeast and dipping toward the northeast, through which the Bull road passes, exposing part of the series of copper-bearing strata. The ground-water level of the prospect lies close to the surface, owing to the proximity of Fox run, and the porosity of the sandstone is of such a nature that at a few feet below the surface the rocks are highly saturated.

Disseminated in Sandstone

This deposit of copper ore occurs as a dissemination of a certain horizon of the Triassic sandstones (Newark series), characterized by fossil plant remains, such as Calamites and Equisetaceae. No veins have been observed, the ore occurring in a finely disseminated condition throughout the sandstone, thus necessitating the mining and treatment of all the copper-bearing material.

The sedimentary rocks present consist of gray, green, and red sandstones, the copper minerals being disseminated in the former, which is usually fine-grained in texture. Microscopically, the copper-bearing sandstone consists of grains of silica (quartz) and a mica (probably muscovite) cemented by kaolin and calcite, together with more or less carbonaceous matter derived from fossilized organic remains, the living types of which were abundant prior to and during Triassic times. These sandstones, like certain Triassic sandstones in England which are characterized by the occurrence of copper, contain little grains of a grayish-green mineral, which may be glauconite. These grains have rounded shapes, and are thought to be casts of foraminifera. The sandstone in which the copper ores occur may be termed a calcareous-micaceous sandstone.

Deposits of this type are generally found at considerable distance from igneous rocks, and while no such rocks were found in the immediate vicinity of the prospect, yet in the fields and along the road, about five-eighths of a mile to the north, many boulders of Triassic diabase were observed.

Primary Ore

The primary ore in most deposits of this nature is generally chalcocite, with subordinate amounts of bornite, chalcopyrite, and pyrite. Secondary ores, or those resulting from surficial alteration, are native copper, cuprite, melaconite or tenorite, azurite, malachite, and chrysocolla. Gangue minerals are rarely present. A characteristic feature of this type of deposit is the occurrence of plant remains, replaced by ore. In the deposit under discussion, the primary ore is seemingly chalcocite, so finely disseminated as to be almost invisible to the unaided eye. The secondary ores are native copper, cuprite, melaconite or tenorite (?), azurite, malachite, and chrysocolla, which appear to be more abundant in that they may be readily distinguished by the unaided eye. No chalcopyrite, bornite, or pyrite have been seen in these sandstones.

Chalcocite or cuprous sulphide (Cu_2O), containing about 80% copper, occurs in finely disseminated grains throughout the sandstone; replacing fossil plant remains; and as disseminations in carbonaceous shale. Native copper occurs as grains forming small nuclei, surrounded by cuprite and chrysocollo.

Cuprite or cuprous oxide (Cu_2O), containing, when pure, 89% copper, is read in color and occurs as minute stains upon the carbonaceous shale, as small segregations surrounding nuclei of native copper, and between the laminae of the mica present in the sandstone. Melaconite or tenorite (?), the black oxide (CuO), occurs indiscriminately scattered throughout the sandstone. Malachite ($CuCO_3.Cu(OH)_2$) the green carbonate of copper, containing, when pure, 58% of copper, occurs as radiating groups, in the form of minute spherical concretions, and as stains between the laminae of the mica. Azurite ($2CuCO_3.Cu(OH)_2$), the blue carbonate of copper, containing, when pure, 50% of copper, occurs in minute monoclinic crystals filling fractures in the sandstone and as stains between the mica laminae. Chrysocolla (CuH_4SiO_5), containing, when pure, 36% copper, is the blue-green silicate, occurring in thin seams associated with cuprite and native copper. This mineral surrounds the cuprite, which in turn surrounds the native copper.

Coal (lignite) occurs as the remains of plant life, existing during Triassic times; in some instances it is replaced by chalcocite and malachite. Pyrolusite (MnO_2) occurs in the form of dendritic stains. It is the black dioxide of manganese.

Effect of Diabase

Whether or not the Triassic diabase near this prospect bears any relation to the origin of the ores is a matter of conjecture. Waldemar Lindgren (*Economic Geology*, Vol. VI, September 1911, pp. 568-582) believes the origin of such types of ore deposits to be epigenetic and to represent concentrations of small quantities of the metal, originally disseminated in the rock. The fact that the copper ores herein described occur in a certain horizon coincides with the belief that the ores are epigenetic, that is, formed during the time in which the ore-bearing horizon was laid down. If this is not the case, why is there an entire absence of copper in the overlying and underlying rocks?

The replacement of certain carbonaceous matter by secondary chalcocite may have been due to oxidation and leaching out of the primary sulphide by hot or cold percolating descending waters, the solutions thus formed having been reduced by the carbon of the coal, thereby precipitating the chalcocite. Kaolin and calcite, which are always present in these sandstones, likewise acted as precipitants.

The following reactions may have taken place in the formation of the ores:

$$2CuSO_4 + 2H_2Ca(CO_3)_2 = CuCO_3.Cu(OH)_2 \text{ (malachite)} + 3CO_2 + 2CaSO_4 + H_2O.$$

$$3CuSO_4 + 3H_2Ca(CO_3)_2 = 2CuCO_3.Cu(OH)_2 \text{ (azurite)} + 3CaSO_4 + 4CO_2 + 2H_2O.$$

$$CuSO_4 + H_2Ca(CO_3)_2 + H_4SiO_4 = CuH_4SiO_5 \text{ (chrysocolla)} + H_2O + 2CO_2.$$

Furthermore, part of the carbonaceous matter present undoubtedly reduced the copper-bearing solutions with the formation of native copper as:

$$2CuSO_4 + 2H_2Ca(CO_3)_2 = CuCO_3.Cu(OH)_2 \text{ (malachite)} + 3CO_2 + 2CaSO_4 + H_2O.$$

$$CuCO_3.Cu(OH)_2 + C = 2Cu \text{ (native copper)} + 2CO_2 + H_2O.$$

The following reactions may have taken place in the formation of chalcocite and native copper:

$$4CuSO_4 + 4C + H_2O = Cu_2S \text{ (chalcocite)} + CuCO_3.Cu(OH)_2 \text{ (malachite)} + 3CO_2 + 3SO_2.$$

$$Cu_2S + 4O = CuSO_4 + Cu \text{ (native copper)}.$$

$$2CuSO_4 + 2C = 2Cu \text{ (native copper)} + 2SO_2 + 2CO_2.$$

Institute Papers

At the New York meeting of the American Institute of Mining Engineers there was a preponderance of papers relating to iron and steel, a natural result of the activity of the Iron and Steel Committee of the Institute. A small but important lot of papers dealt with general mining, metallurgy, and economic geology. The complete list of papers presented, so far as they were available in preliminary edition, is printed below.

The Geographical Distribution of Mining Development in the United States. By Edward W. Parker.

The London Mine, Mosquito Mining District, Park County, Colorado. By Charles J. Moore.

The Rôle of Certain Metallic Minerals in Precipitating Silver and Gold. By Chase Palmer and Edson S. Bastin.

The Elk City Mining District, Idaho County, Idaho. By Arthur L. Flagg.

School Laboratory Work; Sampling of an Ore Containing Coarse Gold. By Charles E. Locke.

The Hardinge Conical Mill. By H. W. Hardinge.

Electric Power Installation at El Tigre, Sonora, Mexico. By James W. Malcolmson.

A Problem in Mining, together with Some Data on Tunnel Driving. By F. M. Simonds and E. Z. Burns.

Valuation of Iron Mines. By James R. Finlay.

Notes on Cast Iron. By Albert Sauveur.

Blast-furnace Slag Analyses for Twenty-four Hours. By F. L. Grammer.

The Use of Anti-Piping Thermit in Casting Steel Ingots. By E. A. Beck.

Comparative Notes on Steel Rail Rolling. By Robert W. Hunt.

The Microstructure of Sintered Iron-Bearing Materials. By B. G. Klugh.

New Design of Open-Hearth Steel Furnace Using Producer Gas. By Herbert F. Miller.

Methods of Preparing Basic Open-Hearth Steel for Castings. By H. F. Miller, Jr.

Why Does Lag Increase with the Temperature from which Cooling Starts? By Henry M. Howe.

Piping and Segregation of Ingots of Steel and Ductility Tests for Open-Hearth Steel Rails. By P. H. Dudley.

The Production of Solid Steel Ingots. By John E. Stead.

Commercial Production of Sound Steel Ingots. By Emil Gathmann.

Fire-Clay Deposits of Canada. By Heinrich Ries.

Goldfield Consolidated Report

During the month of December 1912 the total production of the Goldfield Consolidated Mines Co., according to the report of J. F. Thorn, superintendent, was 27,903 tons, containing $457,952, or an average of $16.41 per ton, of which 27,651 tons was milled, with an average extraction of 94.28%, and 252 tons was shipped, of an average value of $24.04 per ton, the net recovery from all ore being $15.48 per ton. The net realization was $270,562, or $6.96 per ton. During the month 3297 ft. of development work was performed. The total cost of mining, development, transportation, milling, office, and general expense was $5.72 per ton, distributed as follows:

Mining (including stoping and development)	$3.07
Transportation	0.07
Milling	2.12
Marketing	0.06
General expenses	0.45
Bullion tax	0.07
Marketing ore	0.01
Total cost of operation	$5.85
Miscellaneous earnings	0.13
Net cost per ton	$5.72

The new orebody on the second level of the Combination has been developed to a considerable extent during the month. Development of the 1400-ft. level has been rather slow, owing to a large flow of water met early in the month, necessitating the installation of additional pumps. The work of prospecting the latite quartz mass for the downward extension of the 1300 orebodies is going forward steadily, and there is every reason to believe that within a short time commercial ore will be found on this level.

Spring-Tension Anchor Bolts

By Henry A. Kuns

The spring-tension type of construction utilized in the Original M. & M. Co.'s 1000-lb. ten-stamp mill was devised to avoid breakage of the anchor bolts in the concrete block by the vibration from the mill while in operation, and also to permit maintaining a uniform tension on the rods. The accompanying illustration clearly shows the construction.

Two coiled springs, one nesting in the other, are used. These are centred on an angle washer, weighing about 75 lb., which is placed ahead of the concrete work making up the monolithic block. The rods are centred in 2½-in. boiler tubing and ent to run from the angle washer to the finished top of the mortar block, which is level. After the mortars were set on ¼-in. rubber sheets and the sole-plates for the battery posts were in place on the solid concrete, the rods were run to place and the springs all placed on the lower ends. The springs were then screwed up to a tension of about 17,000 lb. to each rod of 1¾-in. diam. Since the operation of the mill no breakage or loosening of the rods has occurred.

Fig. 1. The figure shows the position of the angle socket washers and spring in place on the front side of concrete block. The same construction is at the rear. The bolts are withdrawn clear of the mortars from the top in case of breakage. The timber bolted on the block is for the support of the plate floor and leaves plenty of head room for men to work and walk around mill foundation for inspection. The block weighs 95 tons and carries a 10-stamp mill weighing 45,000 lb. The longer bolts shown are holding down bolts to the sole plates for the battery posts.

Fig. 2. This second view is of the power-house, in which is generated 380 hp. in two 30-ft. head turbines. A 30-in. turbine drives a 100-kw., 3-phase, 60-cycle, 440-volt generator, and is designed to drive an additional generator. A 20-in. wheel drives an Ingersoll two-stage compressor. The current drives the mill shop, and the electric underground hoist, and inside lighting of the camp. The distant peak is just north of the famous Hite mine, Mariposa county. The N. V. railroad tracks are also shown. The station is called Clearinghouse and is six miles from El Portal The Merced river furnishes water for power.

The springs are designed to stand a pressure of 3500 lb. each before closing. It is not possible to secure this, as it would require three or four men to bring the nuts to a solid bearing. The springs keep a steady tension on the rods, even if the sheet rubber should thin down due to weight of mortar, tension of anchor bolts, and pounding of stamps. My idea in this construction was to eliminate breakage of anchor bolts, the constant labor of going over the bolts and tightening them up, and the consequent poor working of the mill caused by mortars getting out of proper line.

Should any anchor bolt fail, it can be withdrawn in a few minutes and a new one inserted, as the bolts are accessible at both ends. The mill is of the back-frame type of construction and is driven by a special mill motor placed at the rear of the mill and so mounted that the main belt (the only one used in the mill drive) is tightened by moving the motor on its base. While this plan is objected to by many for a large mill, it is not so bad as it may seem.

The cam-shaft pulley is 84 in. diam. and this permits considerable space between the top belt and the finger platform. The belt is guarded to prevent accident to the millmen. By this arrangement, light, so desirable over the plates in front of the mill, is unobstructed, cost of material and labor is much reduced, and the counter-shafting is eliminated, with its consequent loss of power. Time will, of course, determine whether or not the anchor bolts will yield, but so far no evidence has been shown of any weakness of the plan. I believe that it will be an improvement in mill construction.

The deepest borehole in the world is near Cynchow, Silesia. This reached a depth of 7350 ft., nearly three years being required to complete the work, as the hole was completed from a depth of 1800 ft. by means of the diamond-drill. The total cost was $75,000, and 700 carats of diamonds were consumed. It was expected that the coal seam sought for would be reached at 4500 ft., and it was therefore necessary to ream out the hole down to that depth in order to continue drilling. The temperature of the rock at 1500 ft. was 78°F., and at 7280 ft. was 182° Fahrenheit.

Damage done to vegetation by smoke and smelter fume has been extensively studied in Saxony, and the Ministry of Finance has announced another competition for prizes in this field, supplementary to the competition of 1908. Devices to produce a soot-free combustion are excepted, but any other work, including literary contributions tending toward the solution of the problem of smoke damage, is eligible for competition.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

The Sorting of Ore

The Editor:

Sir—As nearly all mines commence by shipping sorted ore, it is well to remember that right here a property can be made or marred. In Mexico, where there are no labor laws to bother (and, by the way, neither strikes nor 'hobos'), a bunch of boys do better than men on the light work: they cost less, booze, dances, and cigarettes don't trouble them, they are not so apt to 'high-grade', and are quicker to learn: also they may be searched, if necessary, without the aid of a shot-gun.

One man to do the breaking and two or three boys as helpers, is about right usually; a small man will generally sort more ore than a big one, for the reason that there is less lost motion and he is closer to his work. Often a man shoveling into a wheel-barrow and a boy on each side of the barrow picking out ore or waste, affords the quickest way to clean a lot of dirty ore. Spalling hammers wear badly, especially on a flinty ore. Make the men take the handles out once a week and put them in the other way—anyone having seen the Cornish square stamp at work will see the idea. When the ore is 'mucky,' or even dusty, rig a grizzly and clean it with a jet of wet steam, or a spray of water from a hand-pump. Often ore may be sorted twice as fast by wetting it and the old prospector who assays a rock by licking it and then scratching it with his knife, obeys two golden rules. Sunday work is unnecessary, but a small premium for a full week's work helps. Breaking in a new ore-sorter costs money, as his discards must be piled up and gone over by a boy who knows the ore. The men's hands must be cared for. They ought to wash them noon and night and grease them. Soap, warm water, and basins ought to be supplied and axle grease with a little flower of sulphur mixed in it costs little, and will keep the hands in good condition.

The sides of a sorting house ought to be built of panels, so that they can be stacked away in summer. There should be windows in each panel with wire screens inside. Everything inside, roof and all, should be whitewashed to give a good light. A stove is necessary in winter, as cold fingers are poor tools. Have track wherever needed. I find that inside one strap is as good as two. Two spikes only for each tie prevents splitting. Place one pair outside the rail to keep the track from spreading and on the next tie, one pair inside. For changing track, the inside spikes only are pulled. In drifts, break the joints midway; this makes a better track, and only one half railpiece is needed at the end. Change this from one side to the other, putting in one full length rail in its place. This keeps the track close to the face with one-half the work. The common frog and tongue do for switches. A long tongue, 8 ft. or so, is the whole secret; one can cut out 10 in. of the lower part of the rail, round up and double down the upper part, making this serve as a pin, and bringing the tongue close up to the point of the frog.

If possible, keep mill ore and waste widely separated. This should be done from the start; keep a tally of cars every day, and an assay once a week of mill dump. Stating the week's tonnage is not much work and gives valuable data later. Above everything, the man in charge of the sorting, the mine foreman, and the assayer, must be firm friends and must all pull together. Often the foreman can arrange to strip ore in the mine and bring it out clean, saving much work, and the assay returns ought to be out the day after they are received; otherwise they are often valueless.

To find the tonnage in a mine dump, when it is not known whether the ground underneath is a hill or depression, is difficult. The best way is to measure all workings from which the dump came, and allow two tons for each foot of 4 by 6 drift, with other workings in proportion. This gives a conservative but close result. When sampling a dump, it is safer to first determine where the sorting was done, and then carefully keep away from that part.

Nacozari, January 25. AN OLD ORE SORTER.

Persistence of Ore in Depth

The Editor:

Sir—In the *Mining and Scientific Press* of December 21 last, Stephen J. Lett contributed interestingly to the discussion of 'Persistence of Ore in Depth.' In this Mr. Lett referred to a contribution by myself, appearing in your issue of October 12, 1912, entitled 'Possibilities of the Mother Lode in Depth,' and says the details given by me "prove conclusively that, in many instances, the mines of the Mother Lode improve in depth, but the statement that 'proper geologic conditions seem to be more important than all other considerations,' is disappointing, for he leaves us completely in the dark as to what those proper geologic conditions may be."

In the first place, I agree with George E. Collins that "prospectors do not usually sink on barren veins to find out what is below. Ordinarily prudent people, as a rule, only sink on veins which show at the surface evidence of productiveness." Mr. Lett calls attention to the fact that there have been noted exceptions to this, and again cites me as authority for the statement that shafts have been sunk to depths ranging from 200 to 1000 ft. before payable ore was found. I wish to make plain, in this connection, that this seemingly foolish prospecting was done on the line of the Mother Lode, where there were rich mines already developed in the vicinity, both north and south of them, and that these undertakings were not, perhaps, as desperate as they seemed to be, as has been proved by the profitable results of the subsequent operations.

In saying that "proper geologic conditions seem to be more important than all other considerations," I, perhaps, made an unfortunate choice of a term in using the word 'geologic.' Possibly the word 'physical' would have been better, or a combination of these two words, by saying 'geo-physical.' All

who have had an opportunity to study the Mother Lode throughout its length are familiar with the several formations in which this great system of fissures occurs. The principal rocks are: clay-slate; ancient greenstones (meta-andesite), which are found massive, schistose, or slaty, depending upon the amount of pressure and shearing to which they have been subjected; serpentine, or more rarely gabbro; in some localities large or small masses of ferro-dolomite; and in a few instances intrusions of basic or acid rocks, the former being usually diabase, the latter aplite, or its felsitic equivalent. Pay-shoots are known to occur wholly in the blue-black clay-slate, as at the Keystone mine, at Amador City. These rocks contain fossils which have shown them to belong to the Jurassic. More rarely the veins occur in the clay-slates of the Calaveras formation (Paleozoic), as at the Jumper mine in Tuolumne county; in the greenstones (massive, schistose, or slaty, as the case may be), as at the Utica group at Angels, Calaveras county; at contact of these two kinds of rock, the slates and the greenstones, a noted example being the Eureka Consolidated at Sutter Creek; in the ferro-dolomite, as at the Melones; and at the contact of slate with serpentine or some other kind of rock. In fact, the combinations which actually exist in the way of contacts of various rocks are numerous, and in some places the geological conditions are very complex and a puzzle to the geologist as well as the miner. Occasionally veins at contact are persistent for several hundred feet, but generally the contact may be considered as incidental, the fissures cutting diagonally in both strike and dip through the stratified formations, though at a low angle. All of the formations are extremely irregular in the dimensions of their mass, pinching or swelling, coming to a sudden ending without apparent cause, and otherwise presenting complex and erratic conditions most difficult to understand.

From a consideration of the above it at once becomes evident that if a certain kind of geological condition, or association of particular rocks were all that is necessary to insure ore, engineers would have a right to expect a continuous fissure with pay-rock along the entire distance throughout which the favorable rock, or combination of favorable rocks, might extend. Experience proves that nothing of the kind occurs. It is also known that rocks of the same age and of identical physical appearance with those which form the walls of veins that have produced hundreds of millions of dollars, are to be found extending for miles along the Lode where no ore-shoots have been known to occur, nor is there any evidence that they might be found by prospecting. The natural inference, then, is, that the first thing to do is to find a good strong fissure, is it not? Apparently not, for in the case of the South Spring Hill mine, in Amador county, a shaft was sunk at the contact (slate foot, greenstone hanging), where there was not even a gouge seam to guide the miners. This shaft was continued to a depth approximating 500 ft. without ore, but at that depth the formation which had been standing steeply, flattened somewhat and quartz began to make its appearance, and soon after, at a little greater depth, ore was found. This mine produced over $1,500,000 with a poor beginning, and at a place where, in all probability, Mr. Collins would not even advise a prospect hole. In this instance the principal geo-physical condition appears to have been a change from a steep to a flatter dip of the formation, or of the vein. As a rule, along the Mother Lode, veins which have proved to be strong, persistent, and profitable, do not stand at angles approaching the vertical. The normal dip is about 60° below the horizon, though varying from 35 to 65, and more rarely as high as 70°. Regions of excessive disturbance do not usually produce large and profitable mines, at least not on the Mother Lode. In such regions ore-shoots may, and do, occur, but they are short and the value is nearly always 'spotted.' Such a region can generally be recognized at the surface by the occurrence of numerous gullies, and more or less pronounced depressions. I can recall to mind no mine that has been largely profitable, or even one which was profitable at all, where this surface condition obtains. Often, and I may say nearly always, when the end of a profitable shoot of ore is being approached in mining, a distinct change in the physical appearance of the vein is observable. The fissure begins to turn toward foot or hanging, or the vein straightens up; the quartz bodies begin to pinch and swell, and sometimes only gouge fills the fissure, the quartz disappearing entirely. In other instances, and I recall several such, the quartz continues, but it becomes dry and harsh in appearance, and with this change from what the miners call a 'lively' to a 'dead' quartz, the value of the ore also drops or disappears entirely.

It is the physical appearance of the vein that must guide the miner. Water is usually considered a favorable indication, and so it often is, but water alone is not to be depended upon, for water will issue from a barren fissure, or along the course of a dike, as readily as from the richest vein. Several years ago a well known mine superintendent on the Mother Lode was showing a friend, who was also a stockholder, through the mine of which he was in charge. Passing through a cross-cut they came to a vein about a foot wide in which gold could be seen liberally sprinkled through the quartz. The visitor gazed upon this evidence of wealth with natural satisfaction, and congratulated the superintendent, and incidentally himself. He was astonished when told by the superintendent that it did not amount to anything and would not continue twenty feet. He was right, for it entirely disappeared in a little over half that distance. This vein was a short shoot of dry-looking quartz, occurring in a twisted and irregular formation, and the wise superintendent had learned by experience to distrust veins of that description. A few weeks later the same stockholder made another tour of inspection of the mine with the superintendent, and found the rich vein gone and the working place deserted, but a few feet farther along this cross-cut another vein had been cut a day or two previously. No quartz was in sight, except a few small threads of it

mixed with a little calcite. The fissure was filled with bright glossy foliated slate and a soft putty-like gouge. The whole face was damp, and a little water trickled away on the floor of the drift. The entire face reflected the light of the candles from a thousand little crystals of sulphides. "Now," said the superintendent, "here is the true business —this will make a valuable shoot of ore, if I am not greatly mistaken." It is interesting to know that again this man's judgment was confirmed by subsequent results, for this shoot produced several hundred thousand dollars.

Berkeley, California, February 15.

Methods of Teaching Assaying

The Editor:

Sir—In your issue of February 8, D. C. Livingston presents an interesting discussion of methods of teaching assaying and invites comment thereon. Ten or fifteen years ago the teaching of assaying was in a truly pitiable plight. The faulty organization which still hampers the work of many mining schools generally placed this course under the supervision of the chemistry department, and the helpless student was in many cases under the tutelage of men who had never seen the working laboratory of a mine, mill, or smelter, and who labored under the impression that experience in the complete analysis of complex silicates was the practice best adapted to qualify a mining engineer for work in the chemical phases of his profession. This emphasis upon theory was in part a reaction against the pressure from students who desired to learn to do assaying by intuitive methods similar to those by which a Southern 'mammy' does her cooking, but was in large part due to a lack of perception by the teachers of the real needs of the student and of the methods by which they may best be met. Fortunately those days are now permanently passed.

Mr. Livingston's argument as to the necessity for the student spending a whole day in the laboratory in order to accomplish really effective work interests me, since I so strongly urged the same point upon the president of the University of Wyoming, ten years ago, as to secure the necessary change in the schedule of hours. The long period has the disadvantage that the student performs a relatively large amount of work with little opportunity for study and classroom conference, but where the number of students per instructor is not too great, conferences can be held in the laboratory, where they are most effective and useful. And the earnest student finds many brief opportunities for study, while waiting for operations to complete themselves, that can profitably be utilized.

The matter of never allowing the student to mark his crucibles is one of which the importance may easily be overestimated, in my opinion. Crucibles are not marked in a laboratory where a large number of determinations of a similar character are made, because the slight saving of labor thus effected is obtained without material inconvenience, since all the crucibles are placed in the muffle at once and similarly withdrawn. But where the student is carrying on determinations of different character, which require longer or shorter periods and differing degrees of heat, it is not practicable to conduct his work in such a wholesale fashion, and the use of a distinguishing mark is a great convenience, in the early stages of his work at least. The essential thing is to get the student to understand what he is doing, and why, and unless he does understand, it is immaterial whether he makes ten or fifty determinations per day. In concentrating attention upon the commercial details of work too early in the course, there is grave danger of diverting the student's mind from the consideration of the fundamental chemical criteria which must be the basis of right practice. I remember with amusement the superintendent of a mining property in Colorado who vehemently assured me that as a mining school my *Alma Mater* was a failure, adducing as proof the fact that several of its recent graduates whom he had employed had proved incapable of handling 30 or 40 unmarked determinations daily without getting them mixed. Whether or not they evidenced any understanding of their work was apparently a minor affair.

It is highly desirable that the student should upon graduation be able to do one or more things well enough so that he can 'hold a job' on the manly basis of adequate service rendered for compensation received, and assaying is one of the subjects best adapted to semi-vocational teaching methods. But the student who has devoted four years of precious time, and money that in many cases can ill be spared, in an attempt to make an engineer of himself, only to find, after a few years experience, that the short-sighted instructors to whom he entrusted his future have converted him into a high-grade workman, certainly has grounds for a suit for educational malpractice. Shift-bosses and foremen are essential elements in the success of mining operations, but college training and the curriculum of a technical school ought not to be laid out on the hypothesis that any considerable number of its graduates will find their permanent level as shift-bosses and foremen, or even as assayers and surveyors. As a matter of fact, only a comparatively few of the entering class of any technical school were ever intended by nature to become real engineers. The rest cannot be made to score a success, no matter what treatment they get, and the rational method is to give the best possible training to the best men. It is better for a school to turn out a dozen first-rate men in a lifetime than an army of mediocrities. Just what constitutes the best possible training 'is another story,' and no two persons are likely to agree absolutely in its recital.

Thomas T. Read.

San Francisco, February 8.

Flotation Patents

The Editor:

Sir—My reply to the letter by E. H. Nutter in your issue of January 25, is that nothing is to be gained by the discussion of matters which the courts of justice will soon settle.

London, February 20. J. D. Wolf.

Special Correspondence

NEW YORK

LEGISLATION AFFECTS SITUATION. — COPPER MARKET UNRESPONSIVE. — RAY CON. — HEDLEY G. M. CO. — GREENWATER.

Legislation, both state and national, threatens a degree of regulation under which, according to the unanimous voice of the older conservative forces in New York, the doing of business will become impossible. The enforced incorporation of the stock exchanges is a possibility, if not a probability, and to most members of the New York Stock Exchange this appears sacrilege, leaving nothing to be despoiled. The most recent measure which has spread consternation is a threatened doubling of the transfer stock tax. By a statute of the state of New York there is required to be paid by the seller of any stock, when sold within the state, a tax of 2c. upon each $100 of par value; on most stocks dealt in on the New York Stock Exchange, being of $100 per share par value, the tax amounts to $2 per hundred shares. There has been a deal of heated discussion concerning the possible action of the state legislature and much talk of removing the exchange to Boston or Philadelphia. The matter has not sufficiently crystallized as yet to justify any prediction beyond the one that one effect of such action will be to bar the small trader out of the market, and such might, on the whole, rather commend the idea to one not impregnated with Wall Street atmosphere. As to moving the Stock Exchange, romantic minds have more than once tried to picture New York's financial district uninhabited, its busy streets transformed into deserted canyons. Inasmuch as the great financial machinery of New York has been built around the Stock Exchange, it is hard to picture what would happen—the slump in realty values, the palatial skyscrapers without tenants, or at least without that class of tenants for which they were constructed. Yet many brokers have already notified owners of office buildings that leases would not be renewed, or would be renewed only subject to cancellation upon the passage of the threatened legislation.

The question of amortization, income, or liquidation of assets of mining properties, is being considered by the Supreme Court of the United States. The case is one which involves the Stratton's Independence, and was certified by the Circuit Court of Appeals to the Supreme Court for the construction of the corporation income tax law, the question broadly being whether such tax may be collected from mining corporations on the proceeds of the sale of minerals extracted, and going really into the question as to what is the net profit produced by a mining company.

In view of all the untoward factors, the Balkan situation abroad, and the Mexican upheaval, it is not to be wondered at that the copper situation has failed to improve. Sellers have been making a price this week of 15c. per pound, but have failed to attract buyers in large numbers. The truth is, the buyer realizes his advantage under present conditions. The vastness of the operations of the modern copper mine is at once its strength and its weakness. The manufacturer can curtail and cut close, but commercially speaking, the large copper mines of today are in a position where time is the essence; the investment of the huge sums necessary for production on a profitable scale makes imperative the forcing of such production at top speed in order that carrying charges may not eat any more than necessary into net profits. This simple financial analysis has by no means been lost upon the user of copper, who is apparently inclined to take to himself all the advantage of the present situation. It is expected that the Lewisohn interests, which have for so long controlled the Tennessee Copper Co., will step down and out at the coming annual meeting. The estate of Leonard Lewisohn, who was a brother of Adolph Lewisohn, formerly held control of the company, but this holding is now said to have been liquidated. The younger generation, which has been in the active management for some years, will probably withdraw entirely, although they have been requested to continue to act, at least in an advisory capacity, with the new executive heads. James Phillips, Jr., the former head of the Nevada Consolidated, will probably have an active part in the new management.

The Ray Consolidated Copper Co. reports a net profit for the quarter ended December 31 of $583,827; the total production of copper during the quarter was 10,490,661 lb. The production for the year was 35,861,496, which when compared with the output of the previous twelve months of 15,721,520 lb., shows that Ray is getting into its stride as a producer of copper. Copper costs for the quarter were 9.3754c. per pound, and for the year 9.828c. Chino's output is showing an equally gratifying growth. For the quarter ended December 31 there was produced 11,067,864 lb., which compares with 10,608,478 for the third quarter, 4,289,644 lb. for the second quarter, and 3,271,980 lb. for the first quarter. Copper costs for copper produced by milling operations for the last quarter of the year were 8.49c., as compared with 6.57c. for the preceding three months. In this figure, however, are included all operating, administration, and general charges, and a charge of 30c. per ton of ore treated to cover mine development and stripping expense. The cost per pound from crude ore shipped was 7c. after allowing for smelter deductions. Increased costs are stated to be due to a high percentage of iron resulting in a lower ratio of concentration and a lower grade concentrate. The average daily tonnage treated is now running nearly 5000 tons.

The directors of the Calumet & Hecla have declared a dividend of $10; this is a reduction of $2 per share as compared with the last quarterly disbursement. The company is paying $1,685,000 of its 5% notes which were issued in connection with its purchase of the Bigelow properties. The notes are being redeemed at 102 and interest, and when the present payment shall have been completed will leave but about half of the original $8,519,000 issue outstanding. The Isle Royale, one of the Calumet & Hecla properties, is paying an initial dividend of $1 per share, and this company is acquiring increased importance by reason of the purchase of the Montezuma tract adjoining the Isle Royale ground. The taking over of this property is estimated to give to the Isle Royale some 60,000,000 lb. of additional copper net. The Lake Copper Co. announces that openings on the 11th level, the deepest workings in the property, show rich copper. There have been some recent rumors as to the showings in the lower levels of the Lake property, which make the announcement of no little importance to the shareholders.

The Hedley Gold Mining Co.'s report for the year shows a tonnage handled of 70,455 tons, of an average value of $11.19 per ton, or a total value of $788.715, an average extraction of 95% being maintained, yielding gold to the value of $748.133. Dividends of $360,000 were paid, and an undivided surplus carried forward of $226,841. In his report, I. L. Merrill, president, states: "We have acquired the adjoining claims known as the 'Windfall group,' lying to the northwest of our property. Our exploration work demonstrated that the ores passed into this acquired territory, which promises well for a long life to our mines."

An echo of the boom days of the abandoned camp of Greenwater, Nevada, is heard in the recent annual report of the company, which, as its most interesting item, contains a list of some $83,000 in gilt-edged bonds held in its treasury. The company is operating at Dale, California, but has for some time been casting about for a mining property in which to invest its treasury funds.

Receivers have been appointed for the United Copper Co., for so long one of the market footballs and mysteries under the control of Fritz Augustus Heinze. Liabilities are set down as $4,501,734, with nominal assets of $6,000,000. Cash on hand is less than $1000, and among the assets are accounts due for large amounts from the Montana Ore Purchasing Co. and the La France Copper Co., both of which are or were Heinze properties. At present Heinze is making war against William Guggenheim and his associates on claims growing out of the overthrow of the firm of Otto Heinze & Co., which latter firm went down in the panic of 1907.

LONDON

TIN IN SIAM.—RADIUM AND PROMOTION.

In my last letter I gave some particulars of a new tin lode deposit discovered at Ardlethan in the centre of New South Wales. Another Australian tin venture that is attracting attention in London is at Tongkah harbor on the west coast of the Western Siamese States between Burma and the Malay Peninsula. Australian capitalists are not so ready nowadays as formerly to put money into tin properties within the confines of their own continent. In this way they resemble the Cornishmen who would rather invest in Malayan propositions than in the old has-beens at their own doors. The Tongkah harbor business has rather a curious history, for after the flotation of the company three years ago experts sent to make a further examination unanimously condemned it. However, the promoters went ahead undismayed, and have had the gratification of making large profits. The first dividends were distributed about 18 months ago, and as far as can be ascertained, the prospects continue excellent. There are four dredges at work, two built by William Simons, of Renfrew, Scotland, and two by Werf Conrad, the Dutch firm. The last yearly statement shows that the amount of material treated was 3,157,549 cu. yd., as compared with 2,217,343 cu. yd. the year before. The produce was 1385 tons of tin concentrate, as compared with 1142 tons. The average yield was just under 1 lb. per cu. yd., as compared with 1.15 lb. The receipts were £153,465, being £110 16c. per ton, of 11⅝d. per cu. yd., as compared with £117,487, £102 15s. and 12¾d., respectively. The working cost was £53,884, and £26,482 was paid as royalty spent in work required by the Siamese government as part consideration for the concession. The working cost per cubic yard was 4d., as compared with 4½d. the year before. The total cost was 6d. The divisible profit was £80,366, and £84,563 was distributed as dividend, being at the rate of 55%. The extra expenses referred to above were due to the work done by one of the dredges in opening the harbor at Tongkah. Not only did this mean the expenditure of much money, but it kept the dredge away from its regular duties. The dredging of the harbor formed part of the agreement when the concession was obtained from the Siamese government. Naturally the inclusion of its cost in the 'working' cost is not popular with the engineers in charge.

For colossal impudence, the batch of so-called literature masquerading as a prospectus for the Société Industrielle du Radium is quite in advance of anything that has been offered to the public during the last few years. The scheme is an 'emanation' from the brain of one Frank Sherwood Gray (if that is his real name), who, I regret to say, is an American. For some time he has been pushing the shares of a company called the British Radium Mines. He has had to return such money as was subscribed. This company was supposed to own the Tolgarrick mine, between Falmouth and St. Austell, Cornwall. The new company owns its better-known neighbor, the South Terras or Uranium mine. This mine has for many years yielded a desultory output of pitchblende and other uranium ores such as autunite and torbernite, which were treated by Benedict Kitto for the extraction of uranium oxide. But the demand for uranium compounds is small. The circulars now issued in French and English use Madame Curie's name as their leading line. Elaborate documents are issued containing copies of reports written at her establishment in Paris relating to the radio-activity of the minerals and of the mine-water. On the strength of all this, 5000 shares of the nominal value of £4 each are being offered to the public at £5 each. Statements are made to the effect that the proved content of radium in the developed ore and dumps is worth over a million pounds. The difficulty that strikes the candid critic is that when the radium has been obtained it will be unsalable. Another Cornish venture has in its strong-room a fabulous amount of radium compounds bottled up like King Solomon's genies in leaden vessels, but unfortunately there is nothing doing in the radium market. The saddest feature of the whole affair is that a member of the Institution of Mining and Metallurgy has lent his countenance to the scheme by becoming a director.

BUTTE, MONTANA

CHANGES AT ANACONDA.—LEACHING SUCCESSFUL.—FIGHTING FIRE.—BARNES KING, ELKHORN, SOUTHERN CROSS, AND OTHER MINES ACTIVE.

As a result of a long series of tests at Great Falls and Anaconda, some important changes in concentrating methods have been decided on. These changes are expected to bring the saving up to 80 or 85%. The work of remodeling the Anaconda plant is now in progress. As it is not desirable to shut down more than one unit at a time for this work, it will be fully a year before the change is completed. Both the new copper leaching plants at Butte are said to be in successful operation now. The published statements concerning the plant of the Butte & Duluth M. Co. indicates remarkable success, and, if true, give promise of opening up an important new industry for Butte. It is not claimed that the ore will average better than 1½ to 2% copper, and yet this is to be treated profitably by leaching. Two steam-shovels have been ordered and will dig the ore for the leaching plant, which is to be enlarged to a capacity of 1000 tons per day. It is claimed that a 90% extraction is made, at a total cost for mining and treatment of less than $2 per ton, or less than 5c. per pound of copper produced. As leaching solutions containing 10% sulphuric acid are used, the leached ore is moist with a valuable amount of acid. It is hoped to save this by subjecting the leached ore to weathering agencies, storing it in open piles that can be drained.

The Butte mines have a lot of trouble with fires. So much timber and other combustible matter have been left in the stope that spontaneous combustion is a dangerous possibility in any of the old seldom-visited workings. The most recent fire of this kind was discovered on the 500-ft. level of the West Colusa mine on February 12. Steps were immediately taken to get the fire under control, and the miners were removed from danger zones by way of the Mountain View shaft. The great difficulty in fighting such fires is in controlling the noxious gases resulting from combustion. The fire-fighters have to wear oxygen helmets and are supplied with portable electric lights. New ventilation cross-cuts and laterals must be driven, burning workings bulkheaded off with concrete, and the supply of fresh oxygen cut off as much as possible from the burning area. The danger to the firemen from suffocation is not inconsiderable, and it is not unusual for workmen in the bad places to be paid as much as $15 per shift. The West Colusa mine now has two fire zones which are not connected, the other one, on lower levels of the mine, having been burning for several years. These fires increase the cost of mining and withhold a lot of minable ore until they can be extinguished.

The Badger State shaft of the Anaconda Copper M. Co. is to be deepened from the 1800-ft. level at least to the 2400-ft. level. The rapid deepening of nearly all the shafts at Butte is suggestive as to where new ore is to be looked for. The lateral extensions and discoveries are manifestly unable to supply the demand for tonnage.

In December the mill of the Barnes King D. Co., in Fergus county, treated 1757 tons, assaying $8.56 per ton. In January 3286 tons was treated, assaying $9.74 per ton. The February production will be about 3000 tons, assaying close to $11 per ton. The North Moccasin orebody is holding out well, so that the outlook for the property is promising. The Elkhorn Mining Co. has been organized, by Butte interests to operate the Sour Dough mine at Elkhorn. The ore is gold and copper in a gangue which has a high iron content, divided by smelters.

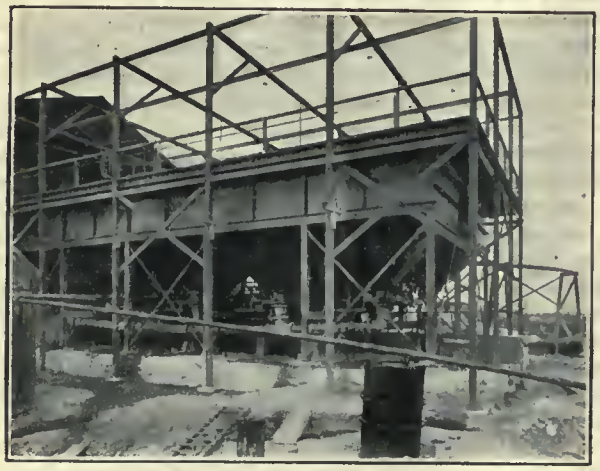
Fifty men are now employed at the Southern Cross mine, in Deer Lodge county. Large ore-bins are under construction and the shaft is being sunk 300 ft. deeper. The Holdfast lease is making regular shipments to the Anaconda smelter. The Hidden Lake shaft is said to be in good ore. The company plans to erect a 50-ton cyanide mill in the spring. Work is progressing at the Blue-Eyed Nellie mine near Anaconda. The burned part of the shaft has been retimbered and the lower workings put in shape for operation.

JOHANNESBURG, TRANSVAAL

GOLD YIELD.—LIFE OF RAND MINES.

The total yield of gold in the Transvaal for the year 1912 has been officially declared by the Chamber of Mines as 9,124,299 oz., value £38,757,560. This is a larger yield than the most optimistic estimate, the last two months' contributions exceeding anticipations. The increase over 1911 was 886,576 oz., value £3,765,940, an increase greater than during any year since 1906, when the mines on the Rand may be said to have got into full swing after the war. There can be little doubt that the new producers such as Brakpan and Modderfontein 'B' in the Far East Rand, City Deep in the Central Rand, Bantjes and Randfontein Central in the Western Rand have materially contributed to this increase, which is all the more welcome on account of several of the mines on the rich part of the Central Rand showing signs of exhaustion.

Out of this huge total the Rand alone was responsible for 8,753,568 oz., value £37,182,795, being an increase over 1911 of 856,576 oz., value £3,639,316, which, it may be remarked, left the outside districts scattered all over the Transvaal, only 370,731 oz., value £1,574,765. Even these outside districts showed a satisfactory increase of 29,810 oz., value £126,624 when compared with 1911, an indication that the old fields of Lydenburg and Barberton are fully maintaining their position, and if the Heidelberg district returns could be included in their proper place with those of the Rand, the term 'outside districts' would



FILTER-PLANT, CROWN MINES.

be more correct, and the division thus made of greater mining value.

In the light of this remarkable increase in the gold production of the Rand last year, it may be interesting to enquire how long the Rand will be able to enjoy the luxury of a progressive gold output year by year as it has practically done since gold was first discovered on the Rand. The difficulties are connected principally with the impoverishment of the Rand banket reefs in depth, a fact known for many years, but which, up to the present, has not been of sufficient potency to neutralize the effects of the continued expansion of mining developments on the Rand. In 1912, however, the effects of this impoverishment with depth has for the first time been shown in a practical manner by the Simmer East finding profitable mining out of the question to such an extent as to go under, the property meanwhile having been taken on option by a neighboring mine. Other mines may find themselves in a similar difficulty before long; in fact, since the close of 1912 the Lancaster West has announced the intention of closing down indefinitely, owing to being unable to work £1 ore at a profit. There is not likely to be any marked growth of gold output, either on the Central or Western Rand, according to the present outlook, so that there only remains the Eastern part of the Rand to supply the necessary new producers to enable the progressive output to be continued in the future. Fortunately, there are indications that several of the new producers on the Far East Rand may be able to increase their present output, others are likely to enter the producing list, particularly if the Government Areas improve as they probably will on being further developed, while, providing the Springs shafts, now approaching the reef, confirm the borehole results, a large area will be considered to be added thereby to the profitable part of the Far East Rand. Nevertheless, there are large areas of the Far East Rand of somewhat doubtful value, and conditions must alter considerably before they can be expected to contribute materially to the output of gold on the Rand. Taken on the whole, therefore, it would appear that most of the new producers will, in the immediate future, probably be established on the Far East Rand, and that on the Central and Western Rand there does not seem much probability at present of new producers being started owing to the immense depth to which most of the deep-level properties have already secured ground. Both the Central and Western Rand should, however, maintain their present output over many years; properties may become exhausted, but by amalgamation or otherwise the mills are likely to be kept fully employed in most instances, while no efforts will be spared in the future at individual mines to increase the present output. On the Far East Rand the output of gold must continue to increase for some time to come, and even when the progressive output has reached its limit, some time must necessarily elapse before the gold-mining industry of the Rand takes a downward course. It is impossible to agree with H. C. Hoover that the Rand even now has reached its limit of progressive gold production; for, as a matter of fact, such is far from being the case. Every year in the future will, however, bring the Rand nearer to such a position; but a marked, distinct, and continued decline in the production of gold on the Rand is still apparently situated some distance in the future.

BOSTON

BUTTE NEWS.—ZINC DISAPPOINTING.—TENNESSEE COPPER.

The new mill of the Butte Central company started off February 16 with some 200 people in attendance, among them a few Boston stockholders. It is claimed that the concentration is excellent and that when the tailing is cyanided the expected recovery of 85% will be obtained. A statement was made here a few days ago that the Davis-Daly Copper Co. had abandoned its workings on the 1900-ft. level. This brought out a denial from the company's secretary, Charles G. Schirmer, who explains that there were two small drifts on the west cross-cut which were started a few weeks ago with the idea of ascertaining the nature of the ground and, as it was found that it was not mineralized, work on these ceased. Mr. Schirmer says: "We are now getting some of our best ores from our 1900-ft. level and shall continue working on this level, without a doubt, for some time to come."

Recent liquidation in the Boston copper-share market has carried prices to new low records for 1913, and in the cases of Allouez, East Butte, Miami, Mohawk, Nevada Consolidated, Superior, Franklin, Quincy, Utah Copper, and Copper Range, to the lowest selling figures since 1911. In the case of Copper Range, the price is the lowest since 1904. Hancock sold at the lowest since 1909, and Lake at the lowest since 1908.

Interests here identified with zinc mining at Joplin express much disappointment at the unsatisfactory condition of the ore market in that district. The price has dropped to a point where it is no longer profitable for any mines except large and well equipped ones to ship to advantage. After postponing the matter from week to week for four weeks, the Executive Council here, by a vote of five to four, denied the petition of Cardenio F. King, a former Boston promoter, for pardon. Word is received in Boston that the active interest in mining shares is shifting to the Cobalt issues and that London is backing the market. Cobalt and Goldfield issues have never secured any particular footing in the Boston market.

The news that control of the Tennessee Copper Co. has passed from the Lewisohns to a new group headed by James Phillips, Jr., formerly of Nevada Consolidated, is

interesting Boston in many ways. The news is correlated with the news of a few weeks ago that the same interests, which are dominant in Miami, offered the control of that property to others, presumably those in control of Inspiration, but the offer was not accepted. Since the fight made by Mr. Phillips against the control of Nevada Consolidated going to Utah Copper resulted in his defeat, he has not been prominently before the copper public, though it has been known that he has been identified with big copper developments in Alaska. Mr. Phillips, many years ago, was the publisher of the New York *Press*, now owned by Frank A. Munsey, and has had a prominent newspaper and mining career. The remarkable slump in the price of Lake Copper stock has turned loose a number of rumors about the property. One is that it is to be included in a combination with Copper Range. Another is that it is to be merged with South Lake, the latter company being thought to stand a good chance of getting the Lake lode in its developments.

The Department of Justice has at length been brought to investigate the 'smelter trust,' but whether the National Lead Co. and the American Smelting & Refining Co. are to be put through a dissolution course has not yet been revealed.

BLACK HILLS, SOUTH DAKOTA

ELECTRIC POWER.—GOLDEN REWARD TREATMENT.

Considering the season and the condition of the ground, good progress is being made on the pole-line to connect the Dakota Power company with the transmission lines of Lawrence county serving the big mines. The line is approximately 30 miles in length, from Whitewood to the power plant on Rapid creek, 2 miles below Pactola. Under the terms of an agreement made last fall, the Consolidated Power & Light Co. will take about 1000 hp. from this plant. The latter company has the field in Lawrence county thoroughly covered, and new mining work makes it necessary to secure additional power, as the two generating stations at present maintained are often working to the limit of their capacity. The Revenue Mining Co., recently reorganized at a meeting held in Lead, and elected the following directors: William Bertolero, president; N. W. Gregory, vice-president; J. F. Peters, treasurer; Dan Walsh, secretary; and J. G. Spencer. An assessment of 3 mills per share was levied, which will be used immediately in development work. The company owns property on Nevada gulch, and has produced good ore in the past. Several offers to lease it have been refused, and the company hopes to produce soon.

During development work at the Astoria mine of the Golden Reward company between 5000 and 6000 tons of wet sulphide ore was put on the dump, and when the recently completed roaster was started the first ore to be used was this dump. It was found to have altered considerably, the pyrite having oxidized to sulphate to a large degree. The decided change in the character of the ore has occasioned a change in treatment methods, and a number of details are being worked out, prior to starting regular treatment of the dump. It appears necessary to move this dump before starting work in the mine. A preliminary wash with water is being tried on the roasted dump ore at the mill in Deadwood; following this an alkaline wash makes a product amenable to cyanidation. The ore is crushed to approximately 20-mesh preliminary to roasting, and this is being leached without classification. Should this method prove a success it will cheapen milling costs. C. C. Tegethoff has been elected president of the company, succeeding A. G. Hackstaff, who recently died. The board of directors, with the vacancy caused by Mr. Hackstaff's death, which has not been filled, is as follows: C. C. Tegethoff, Harris Franklin, R. W. Goelet, C. G. DeWitt, W. B. Devereux, Walter Luttgen, H. D. DeForrest, and O. H. Kahn, all of New York City. The officers are: C. C. Tegethoff, president; Harris Franklin, vice-president; W. C. Johnson, secretary and treasurer; N. E. Franklin, assistant secretary; and Henry Schnitzel, general manager. F. R. Baldwin is superintendent and R. Mosely, mill superintendent.

General Mining News

ALASKA

JUNEAU

The Alaska Mexican, Alaska Treadwell, and Alaska United companies have declared dividends of 20c., $1, and 70c. per share, respectively, payable on February 28.

According to the Collector of Customs, the trade of Alaska during 1912 was valued at $72,741,000, which is 27% higher than any previous year. Some of the principal items were as follows:

Vessels entered at Alaskan ports, tons	487,379
Shipments from United States to all districts	$21,992,761
Shipments from foreign ports	925,034
Passengers arrived	20,645
Passengers departed	18,502
Exports:	
Salmon canned, and others	$16,459,036
Gold and silver	16,031,705
Copper ore and matte	4,904,715
Other fish and products of the industry	914,571
Furs	728,554
Gypsum	129,375
Marble	77,159
Tin ore and concentrate	90,831
Whalebone	18,012
Other merchandise	1,000,261
Total	$40,354,219

ARIZONA

COCHISE COUNTY

The Dragoon district is attracting attention through its zinc deposits. The Wolfram properties are shipping ore to Philadelphia. The Texas-Arizona company employs 20 men, and is shipping ore regularly. At 800-ft. depth the Arizona United Mine Co. encountered water, and opened a large body of high-grade ore on the 700-ft. level. A pump is being installed. The Tyrone Clark mine, 14 miles northeast of Benson, in the Little Dragoon mountains, is installing a hoist and pump. The shaft is down 130 ft. The Commonwealth Mining Co., of Pearce, is doing considerable development, and expects to have its stamp-mill working early in 1914.

GILA COUNTY

During the last quarter of 1912, the Ray Consolidated Copper Co. produced 10,490,661 lb. of copper, making a total for the year of 35,861,496 lb. Ore treated amounted to 460,181 tons, averaging 1.67% copper, and the year's total was 1,565,875 tons, wtih an extraction of 68.28%. Development during the quarter covered 28,000 ft., and to date 292,000 ft. Mining costs were 71c. per ton. Including earnings from the Ray & Gila Valley Railroad Co., the year's profit was $2,069,903. The tonnage treated at the latter end of January was 6200 tons per day; and early in February there was hoisted 8000 tons in 16 hours. The large chalk deposit 20 miles from Winkleman is now being worked by C. H. Patrick, of Phoenix, and several shipments have been made to Los Angeles.

MARICOPA COUNTY

J. T. Lewis on February 18 introduced in the House a bill which prescribes a minimum wage in hazardous mining operations and providing for the punishment of violations of the law. According to the terms of his bill, $4 per day is fixed as the minimum wage to be paid to any person employed in underground work, all work in open pits and open cuts, operating smelters, reduction works, stamp-mills, concentrating, chlorinating, and cyaniding mills, mine sawmills, and all other work where any machinery, powder or dynamite is used or employed under or above ground in the mining industry. In the event of a violation of the law by any employer failing to pay the sum named or proposing to contract for labor at a less sum a trial of the case must in all events be by jury, and each day during

or for which a violation is made constitutes a separate offense.

YAVAPAI COUNTY

Diamond-drilling is under way at the property of the Ford Mining Co., situated in the Black Hills. The vein should be cut at about 600-ft. depth. A pump has been installed on the Haynes Copper Co.'s mine 700-ft. level, and sinking can be resumed. The Mark Twain silver mine is to be worked by lessees. The Fortune Mining Co., which is working the Wizard mine at the head of Big Bug creek, has driven an adit 700 ft. on a vein, the last 200 ft. averaging about 5 ft. wide.

YUMA COUNTY

W. A. Clark has acquired the American Eagle property, situated in the Whipple mountains, 16 miles northwest of Parker. Fifteen men are employed at present, and two auto trucks will haul ore to Vidal, whence it will go to the Clark smelter at Jerome. At the Arizona-Empire mine, about 400 sacks of rich gold-bearing ore is ready for shipment. A carload of copper ore is also ready at the Eagle adit. Owing to the condition of the roads, auto trucks cannot work until they are repaired. It has been suggested that the caterpillar type be used over desert and sandy roads.

CALIFORNIA

On January 31 there were 5845 producing oil wells in the state, and during the month they yielded 7,566,789 bbl., an average of 244,090 bbl. per day, of which the Midway field produced 2,323,803 bbl.; Coalinga, 1,528,115 bbl.; Kern river, 1,000,389 bbl., and McKittrick, 877,114 bbl. Stocks total 47,756,517 bbl. Sixty new wells were completed during January.

CALAVERAS COUNTY

The dredge of the Oro Development Co., of San Francisco, at Comanche started work on February 13. This is the first machine to work in the district. Power is supplied by the Oro Electric Co. At a depth of 160 ft. from the surface, a deposit of gravel 4 ft. thick, averaging $20 per ton, was opened in the Rising Star placer claim at Central Hill, near San Andreas. C. W. Neilsen is in charge for J. E. Richards, of Boston, who has an option on the property for $20,000.

(Special Correspondence.)—F. J. Martin, superintendent of the Utica mine, is exhibiting the Heinze plate which was invented for use in concentrating gold from black sands. The Angels mine, after being closed for a month, has resumed operation. The Lightner is still idle and there is no immediate hope of work being resumed. The Utica company has most of its men above Bigtrees repairing flumes. H. L. Kuns, president of the Waterman Mining Co., is on a visit to that property. Drilling is going on to the satisfaction of the company, but H. A. Kuns, the manager, is considering putting on another shift to rush the work.

Angels Camp, February 22.

INYO COUNTY

From the Cerro Gordo mine, near Keeler, 14,000 tons of zinc ore has been shipped. L. D. Gordon is superintendent. The report of the Saline Valley Salt Co. has been distributed. The tramway will be in operation in 60 days. The greater part of the salt-grinding machinery is on the property near Swansea.

MONO COUNTY

An option has been taken for $50,000 on claims near the Inyo county line, between Deep Springs and Oasis. A shaft is down 60 ft. and will be sunk to 500 ft. A large lode has been exposed on the surface for 600 ft., carrying 12% copper over a width of 5 ft. About 12 miles south from this place a large lode of 3% copper ore is being developed by C. M. Schwab and associates. The shaft is down over 800 ft., and other work done. A power plant costing $20,000 has been erected.

PLUMAS COUNTY

The remodeled stamp-mill at the Oro Fino mine is working well. An adit has been driven on the vein for 500 ft., and the ore is at present 16 ft. wide, worth $9.50 per ton in free gold and sulphides. This mine is situated on a ridge between Hopkins and Poorman's creeks, and is owned by Hewitt Bros. It is said that several stamp-mills will be erected at the quartz mines on Winters and Washington creeks next summer.

TRINITY COUNTY

The Bonanza King stamp-mill, near Trinity Center, which was destroyed by a snowslide in January, will be rebuilt as soon as the weather is suitable.

TUOLUMNE COUNTY

(Special Correspondence.)—Another shaft, and an adit that will connect with it at depth, have been started at the gravel mine of the Springfield Tunnel & Development Co. The erection of a new hoist will be commenced at once, the material already being on the ground. Larger pumps will also be used to cope with the flow of water that has been a serious drawback in the working of the mine. The sinking of a new shaft to a depth of 300 ft. is about to commence at the Louisiana mine, near Tuolumne, which has not been worked for many years. Lumber and other material is being hauled to the property. Recent developments at the Italian Camp mine, owned by Joseph Rolleri and others, have revealed a body of fine ore 5 ft. wide. It is reported that a company is negotiating for the property. A large electric pump has been purchased for the Longfellow mine, which is being unwatered preparatory to the resumption of operations. The Phoenix Lake mine, at which a few men have been employed in development work during the winter, is showing some good ore, and it is proposed to increase the working force in the early spring. After a brief period of idleness caused by the heavy snowstorms in January, active operations have been resumed at the Gem mine, near Confidence. With the beginning of spring there will be a marked increase of activity at the Paymaster. Several buildings are in course of erection. At the Driesam, at Arastraville, which, it is understood, is being worked by the company operating the famous Black Oak, 20 men are employed and extensive development work is being done. A payment is to be made on the property shortly. The company operating the Moccasin Creek mine has developed extensive orebodies and contemplates the erection of a 20-stamp mill in the near future. The Wilson & Means mine, on Jackass hill, operated by Gillis Bros., has yielded another $2000 in gold during the past few days, making almost $5000 in the last few weeks.

Sonora, February 15.

COLORADO

CLEAR CREEK COUNTY

(Special Correspondence.)—B. C. Catren, manager of the Whiting Mining Co., is to resume operations on the Terrible mine, situated on Brown mountain. It is stated that the shaft will be retimbered from the No. 10 level to No. 14 level when sinking will be resumed for 200 ft. Driving will also be started from the five lower levels for the exploration of Dunderburg ground. A force of 50 men will be employed within 60 days. The Golden Glory adit on Saxon mountain has been driven 1515 ft. The heading is now nearing the west extension of the Anamosa vein. Heavy shipments are being sent out from the Josephine mine on Kelso mountain. The ore is galena and brings $75 per ton in silver and lead. The Red Oak Mining Co., at the instance of bondholders, has filed a petition in bankruptcy. The debts of the company amount to $18,000. A. B. Montgomery, of Denver, is in charge. Von Tilborg & Co., leasing on the Gem mine at Idaho Springs, are shipping two carloads of ore each day that averages $15 per ton in gold. The output from the Shaffer & King lease amounts to 20 tons per day.

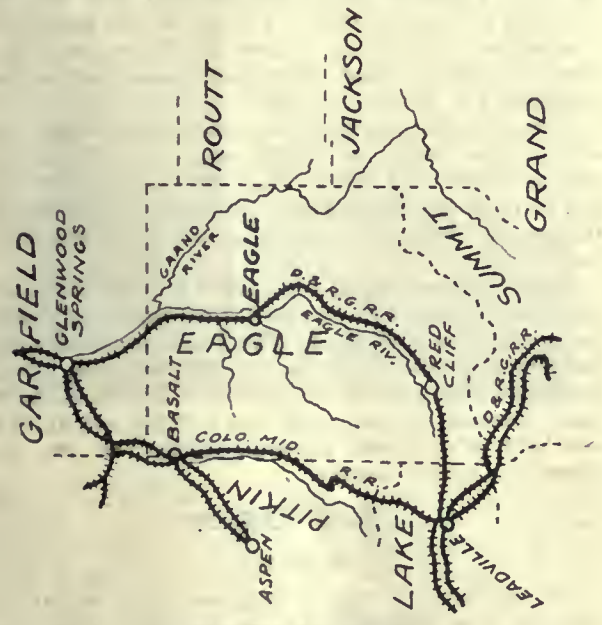
Georgetown, February 17.

CONEJOS COUNTY

A party of 17 men from Cripple Creek is on its way to the new mining district at Gilmore, near Platoro. Samples from Gilmore's claim have assayed $104 per ton. The distance from Alamosa is 47 miles, and there is a good road most of the way.

EAGLE COUNTY

(Special Correspondence.)—The Brush Creek district has always been regarded as an agricultural section, but recently rich silver ore was discovered 10 miles from Fulford, toward the head of Brush creek, and at the junction of Salt and West Brush creeks. Oscar Kempf, E. E. Glenn, and R. S. Wolverton made the discovery. The vein outcrop assays 250 oz. of silver per ton, and the present drift is in over 15 ft. in ore averaging 100 oz. per ton. The formation is laminated sandstone, and the silver in the ore is scarcely visible. Some of the ore contains vanadium. There



MAP SHOWING NEW DISTRICT.

is every reason to believe that this new find is genuine, as Charles Hannington, manager of the Iron Mask mine, has inspected it; also, Thomas R. Henahan, State Commissioner of Mines, who, upon his return, stated that the ore is rich, and his own sampling gave returns from 93 to 477 oz. of silver per ton. On account of the snow, the district having an elevation of about 7500 ft., nobody should go there for 60 days. It looks to reliable people who have been there that the district is destined to furnish the 'new camp' for which Colorado has been looking for some years.

Central City, February 20.

GUNNISON COUNTY

An incline shaft was sunk 200 ft on the Fremont lode in the old Pitkin mine several weeks ago, and about two weeks ago a drift was driven 18 ft. west of the incline and opened rich gold and silver-bearing ore.

TELLER COUNTY (CRIPPLE CREEK)

The Isabella Mines Co. has decided to reduce the royalties on ore charged lessees on the property, and also give assistance in any development thought necessary. The new royalties are as follows:

	Per cent.
Up to and under $10 per ton	10
From $10 to $20 per ton	15
From $20 to $30 per ton	20
From $30 to $50 per ton	25
From $50 to $75 per ton	30
Over $75 per ton	35

A 75-ton mill will be built by Howard Schultz, who has an option on two dumps in the district. Several of the mines have been troubled with gas lately on account of the bad weather.

IDAHO

SHOSHONE COUNTY

The Bell mine, near the Morning and Frisco, has been idle for 5 years, and is to be worked again. Underground workings cover over 5000 ft., down to several hundred feet depth. A lower adit is to be driven. Ohio people are largely interested. The Federal Mining & Smelting Co. has declared a dividend of 1½%, amounting to $180,000, bringing the total to $10,249,750. At the Mayflower mine a drift has been driven 270 ft., and a cross-cut from this 100 ft., opening ore averaging 45% lead, and 45 oz. silver.

MICHIGAN

HOUGHTON COUNTY

W. H. Weed, of New York, has taken an option on the publishing rights of the *Copper Handbook*, the yearly publication compiled by the late Horace J. Stevens for the past 11 years. R. H. Maurer, who was associated with Mr. Stevens, has been arranging for the next issue in July.

MONTANA

JEFFERSON COUNTY

The Elkhorn Mining Co., which has acquired property 12 miles from Boulder, and less than a mile from the old Elkhorn mine, has been incorporated with a capital of 1,000,000 shares of $1 each. Since 1898 the mine has been worked by lessees, who have received net returns of $250,000. At present there is 150,000 tons of ore blocked out, which contains 48% iron, 1.8% copper, 10 oz. of silver, and $5 in gold per ton. The property has been partly developed by an adit, and three raises to the surface. It is proposed to drive an adit at a lower level so as to give a vertical depth of 275 ft. The present workings are below an open-cut, and show 16 ft. of ore. It is said that seven mining men have examined the property with satisfaction.

LINCOLN COUNTY

(Special Correspondence.)—With the filing of deeds in the office of the County Clerk and Recorder at Libby, the news of the sale of the Big Eight mine, near Troy, is confirmed. By these deeds, the Big Eight Mining Co. has transferred to R. C. McCaffrey two patented mining claims, one unpatented claim, and a millsite, which compose what is generally known as the Big Eight property. Two other deeds have also been recorded, in one of which Mr. McCaffrey conveys to Harry L. Day of Wallace, Idaho, a 51% interest in the property. The other shows that he has sold a 14% interest to J. D. Finley. It is stated in the deed to Day that he pays for his interest the sum of $39,231, while Finley pays $10,769. As the parties now owning the property are mining men of means and of good reputation as mining operators, it is supposed here that the mine will be developed. The Big Eight has long been known as one of the most promising properties in the Troy district, and those who are familiar with the mine are confident that it can be developed into a large producer and dividend payer.

Libby, February 18.

NEVADA

CHURCHILL COUNTY

The annual report of the Nevada Hills Mining Co. gives the following details, covering 9 months to December 31, 1912:

Development, feet	5,866
Cost per foot	$10.56
Ore treated, tons	29,976
Value	$798,145
Ore shipped, tons	8
Value	$6,539
Costs:	
Mining	$4.06
Treatment	3.07
Moving ore from dumps	1.98
General	0.49
Total	$9.60
Net profit	$438,909

The Nevada Wonder mill is working full time again after a month's stoppage due to the water-supply being frozen. The pipe broke in a hundred places during the recent cold weather, and extensive repairs were necessary.

EUREKA COUNTY

Contracts have been awarded for machinery for the new

mill of the Buckhorn Mines Co., which is controlled by G. Wingfield of Goldfield. J. W. Hutchinson is consulting metallurgical engineer to the Buckhorn company with F. J. Siebert, consulting engineer for the Wingfield properties. S. J. Kidder, who was in charge of the Pittsburg Silver Peak mill, will have full charge of construction of the new mill. Contracts were let as follows: Lumber and building material, Verdi Lumber Co.; ironwork, Dunham, Carrigan & Hayden, of San Francisco; ore-bins and gates, Power & Mining Machinery Co., of San Francisco; crushing equipment, tanks, agitators, thickeners, classifiers, and filter-presses, Trent Engineering Co. The electrical equipment will be awarded on March 1. The mill will have a 350-ton capacity. Nearly all excavation has been completed.

Humboldt County

The annual report of the Seven Troughs Mining Co. shows a revenue of $110,621, of which $71,624 was from ore settlements and $38,244 from royalties. The surplus is $19,416. At present the property is under lease, which will expire in October, and the company will sink a winze from the lowest level.

At Rochester things are still booming, and everybody is optimistic. Four contracts are to be let for construction of 13,000 ft. of road from Nenzel peak to Oreana. The surveys for the water-supply show that pumping will not be necessary, and a tank of 250,000 gal. capacity will be built above the town of Upper Rochester. In the adit of the Big Four lease the vein at 70-ft. depth has widened out to 11 ft., worth up to $225 per ton in silver.

Since starting work about two years ago, the Winnemucca Mountain Mining Co. has done 4000 ft. of development and shipped ore worth $30,000, while the dumps on the property contain several thousand tons of good ore. The shaft will be sunk to 500 ft., and a mill will probably be erected. The Bonanza Mining Co., north of the former property, is worked by lessees, who have sunk to 200 ft. and will ship ore in March.

Nye County

The January production of all Tonopah mines was 44,755 tons, worth $900,182. During the week ended February 22, the output was 11,499 tons, worth $241,352, the totals for the current year being 86,737 tons and $1,814,882. On the 1400-ft. level of the Halifax mine a cross-cut has passed through 9 ft. of heavily mineralized quartz worth $5 to $7 per ton. The main shaft is down 1555 ft., and will be continued to 1700 ft. The ore-shoot on the 535-ft. level of the Midway has widened out to 5 ft., and shows high-grade silver ore. The Montana-Tonopah has cut the north branch of the Martha vein on the 565-ft. level, where it is 4 ft. wide. The firm of Campbell & Kelly, which erected the Belmont mill and is well known for its pumps and mill spares, will erect the new stamp-mill for the Commonwealth Mining Co., a subsidiary of the Montana-Tonopah Mining Co., at Pearce.

At Manhattan, the Big Four mill only awaits the installation of two large motors before being given a trial. On the Riley fraction of the Manhattan Crescent company a body of schist has been prospected by open-cuts and churn-drill holes across a width of 40 to 50 ft., and yields by panning from $10 to $40 per ton. This is considered to be the greatest surface showing seen at Manhattan. G. B. Rymal and J. W. Choklat are the prospectors, and shipments will be made at once.

Washoe County

(Special Correspondence.)—Fourteen miles north of Reno, C. W. Nelson, T. Warner, P. Kirkegaard, and J. Ray are developing a copper property. A shaft is 82 ft. deep, at the bottom of which a vein is 18 in. wide, worth $150 per ton. At the 60-ft. level a cross-cut was driven 43 ft. to the vein, and then driven on for 125 ft., opening a shoot 12 to 36 in. wide for 90 ft., worth $100 per ton. There are 12 tons on the dump, and one shipment has been made which averaged $112 per ton in copper, gold, and silver.

Reno, February 21.

White Pine County

Returns from the fourth carload of ore from the Kellogg lease on the Cuba mine returned 70.1% lead with 2.55 oz. of silver, 0.5% iron and 10.45% sulphur, the net yield being $40.98 per ton.

The Smokey Development company has been properly financed, and now extensive development can be done in this promising property. During the past year, Giroux Consolidated company shipped 140,877 tons of 2.15% copper ore to the Steptoe plant, and 410 tons of smelting ore was shipped, 152 tons yielding 8.16% copper at Tooele. Production was 3,817,083 lb. of copper, 1232 oz. of gold, and 3032 oz. of silver. The cost was 10.8c. per pound of copper, and net profit $150,000. The strike interfered with work last year, but the daily output at present is 1100 tons of ore. The company did 2485 ft. of churn-drilling on the Liberty, Herstelle Fraction, and Westphalia claims, and cut ore averaging 1.08 to 2.01% of copper.

J. Tilford, who owns tungsten claims on the eastern slope of the Snake range, near Baker, states that the vein has been prospected for 800 ft. The ore is up to 3 ft. wide, and averages 25% tungstic acid. Shipments will be made in the spring. There is plenty of timber and water in the vicinity.

During the quarter ended December 31, 1912, the Nevada Consolidated Copper Co. treated 512,988 tons of ore, averaging 1.44% copper, of which 477,948 tons was mined from the pits, and 35,040 tons from the Veteran mine. Copper production was 8,986,905 lb., making 63,063,261 lb. for the year. Revenue for the quarter was $707,256, and $1,749,524 was paid in dividends, the extra dividend of 50c. being charged to surplus account.

NEW MEXICO

Grant County

The opal mine situated 12 miles east of Silver City and one mile from Bayard station, on the Santa Rita branch of the Santa Fé railroad, is developing into a first-class property. Opals sent to Los Angeles to be cut and mounted show the gems to be of first quality and equal to the best Australian opals. The opals cut were practically taken from the surface and all experts declare they will undoubtedly improve with depth. The owners have located all the opal outcrops, and have covered eight claims. A shaft has been sunk 25 ft., part of the way through talc. The opal camp is well situated with regard to wood and water.

Eddy County

(Special Correspondence.)—Oil has been found at Dayton on the Santa Fé railroad, and a number of important Texas and California concerns are taking leases and preparing to drill. The country is devoted at present to farming, and small amounts of oil have been found in a number of water wells. Recently the water was cased off in one well and an attempt made to collect oil. This resulted so satisfactorily that a test well was bored, and this is now yielding at a rate reported to be 25 to 100 bbl. per day. The grade of the oil is unusually high, and over 20% of gasoline was recovered from one sample tested. The field has been examined by Denver and San Francisco experts, and reported to be worth drilling, though the geology and structure have not yet been worked out.

Dayton, February 20.

Luna County

Phelps, Dodge & Co. are to spend about $1,000,000 on development of the Burro Mountain and Chemung copper properties. The former was acquired in 1910, and the latter in 1912, both being estimated to contain up to 4,000,000 tons of 2 to 3% copper ore. A line will be constructed from the A. T. & S. F. railroad at Whitewater to the mines, a distance of 18 miles. A concentrating plant will be erected at Tyron or Leopold, with 1000-ton capacity.

UTAH

Juab County

The Eagle & Blue Bell of Tintic produced 3800 tons of ore in January from the 700 to 1250-ft. levels. From the 1000-ft. level of the May Day, over 200 tons of zinc ore is mined per month.

SALT LAKE COUNTY

The Yampa mine, which was closed down during the miners' strike last September, has resumed operations, and 100 men are employed, present shipments to Goldfield being 150 tons of ore per day.. The number of employees will be increased to over 200, and shipments will increase to over 500 tons per day.

SUMMIT COUNTY

Ore shipments from Park City during the week ended February 22 were 1419 tons. Development in the Daly-

YAMPA SMELTER, BINGHAM CANYON.

Judge, under the contract system, covered 700 ft. in January. At the California-Comstock property, in Thaynes canyon, the shaft is to be sunk 1000 ft. deeper. An electric hoist and air-compressor have been ordered.

TOOELE COUNTY

The International Smelting & Refining Co., at Tooele, has resumed smelting copper ore, and three reverberatory furnaces are in full blast. In the lead plant, No. 4 furnace has been blown in.

WASHINGTON

FERRY COUNTY

Work has been resumed at the Lone Pine mine of the Republic Mines Corporation, where a large tonnage of ore had accumulated in the stopes. It will be shipped to the North Washington Power & Reduction Co.'s mill, which has been shut down for a short time for repairs.

CANADA

ONTARIO

(Special Correspondence.)—Development on properties in the Pearl Lake and Dome sections, northern Whitney and Tisdale, and several outlying districts has been so encouraging of late that there are signs of a revival of outside interest in Porcupine. The Hollinger Reserve has cut No. 1 vein on the 200-ft. level, where it is 12 ft. wide and of good value. It is reported on good authority that the Cartwrights have regained control of the Pearl Lake company.

Timmins, February 22.

The McEnaney mill is at work, and 5 stamps are crushing 40 tons per day. On the No. 4 level of the mine 6 ft. of ore, worth $48 per ton, has been opened for 30 ft., and on No. 2 level the vein has been proved for 550 ft. It has been decided to increase the capacity of the mill.

MEXICO

SONORA

(Special Correspondence.)—The mills of the Tigre Mining Co. crushed 5732 tons of ore in January, and treated 5502 tons of current and 1618 tons of dump tailing, yielding $132,699. Total expenses, including taxes, were $77,257, leaving a profit of $55,442. Owing to unusual cold weather, recovery from the cyanide plant was not as good as usual.

Kansas City, Missouri, February 20.

The third Great Falls type of converter is in operation at the Cananea smelter, and the fourth is nearly completed.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

THOMAS T. READ is at El Paso.

MAX J. WELCH is in Los Angeles.

PIERRE BOUERY is in San Francisco.

EDGAR RICKARD is in San Francisco.

B. A. HOSKINS is visiting California.

L. J. PEPPERBERG is in Lower California.

F. L. SIZER was in San Francisco this week.

J. A. BURGESS was in San Francisco Monday.

RALPH ARNOLD was in San Francisco this week.

C. C. BROADWATER has returned from New York.

DOUGLAS D. STAVELEY has gone to Saskatchewan.

SUMNER S. SMITH has gone to Washington, D. C.

R. H. HUMPHREY is at the El Tigre, Yzabel, Sonora.

EUGENE VALENTINE has moved to Chicago from Denver.

BOND COLEMAN is with the Santa Gertrudis, at Pachuca.

L. C. GRATON is now living at Cambridge, Massachusetts.

CHARLES H. URQUHART has gone to Newark, New Jersey.

GEORGE WINGFIELD is at the St. Francis hotel, San Francisco.

GEORGE MILTENBERGER, JR., is at Real del Monte, Hidalgo, Mexico.

HORACE F. LUNT is now at the Hillabee gold mine, Alexander City, Alabama.

J. NELSON NEVIUS has returned from New York and was in San Francisco this week.

HARRY CECIL, of London, is in Cobalt, representing the interests of the Cobalt Aladdin.

C. O'BRIEN has gone to Portobelo, Zaruma, Ecuador, with the South American Development Company.

ARCHIBALD STARK has left Valparaiso and is now at Craignoar, Giffnock, near Glasgow, Scotland.

CLARKE SULLIVAN is metallurgist for the Zapilote mine, in Tepic, and has not been appointed superintendent as stated in this column recently.

HOWLAND BANCROFT left last night for Ludwig, Nevada, where he expects to spend the next three weeks on examination work, returning to Denver about the middle of March.

NITRATE production of Chile, during the 'nitrate' year, July 1, 1911, to June 30, 1912, was as follows, in quintals of 101 lb., according to *The West Coast Leader:*

Production, 1911-1912	53,324,534
Production, 1910-1911	53,087,689
Estimate for current year	60,000,000
Stocks of nitrate:	
June 30, 1911	14,625,248
June 30, 1912	13,695,311

Nitrate shipped for the year 1911-1912 was distributed as follows:

	Quintals.
Iquique	12,725,047
Mejillones	7,434,869
Antofagasta	6,927,453
Tocopilla	6,522,180
Taital	6,418,826
Caleta Buena	6,050,243
Caleta Coloso	3,403,415
Pisagua	2,861,897
Junin	1,910,541
Total	54,254,471

DUTIES on nitrate and iodine received by the Custom House at Valparaiso in 1912, representing the shipping ports of the Chilean nitrate industry, was $85,470,812 Chilean, equivalent in value to 36c. each gold.

New York Metal Market Review

February was a month of declines in metal prices, with copper leading and seemingly justifying a common belief that as copper goes so go the other metals. The latter part of the month found copper selling below 15c., almost the price of February 1912. Lead maintained its price despite a dull market. Spelter was subject to repeated declines, its price going lower than at any time in the previous 13 months. Antimony fell off, while aluminum dropped a few points, but only a few. The premium over the import cost of tin diminished, and prices receded from the 50c. level.

Copper

Following a market that had been uncertain, irregular, with very little business, and a steady trend toward further weakness, the large sellers of copper, on February 14, reduced prices of both Lake and electrolytic to 15c. cash for Lake, and 14.87½c. cash, New York, for electrolytic; equal to 15c. delivered cash 30 days. At these prices there was some shading of prices by holders of resale lots. With the lowering of price came the long-looked-for buying movement which it was predicted would take place as soon as the 15c. level was reached. Practically every important copper consumer in the country entered the market and bought, but despite all this the movement was disappointing. The attitude of the consumers was indicated by the fact that nearly all the copper bought was for quick delivery, and the purchasers not only proved that stocks were low, but also showed that faith in the market had not been fully restored. No one consumer took any exceptionally large quantity, but in the aggregate probably 50,000,000 to 60,000,000 lb. was taken. The buying soon subsided and the market resumed its uncertain course again. It looks as if the large selling agencies delayed too long the reducing of prices. Certainly, while the buying was good, it should have been better, and the fact was disclosed that consumers are determined to carry as little surplus supply as possible, just as the consumers of pig iron have been doing with that commodity. A further disappointing fact was that Europe did not take hold to the extent which had been hoped for on the announcement of the 15c. price. While foreign shipments in February were improved, it is believed that some of the copper shipped abroad is to be held pending the real awakening of demand. At the beginning of February the sentiment was bearish, the market dull, and copper for early delivery could have been had at close to 16c., especially from second hands. Future deliveries were selling below 16c. The report of the Copper Producers' Association, issued February 7, showing an increase of nearly 18,000,000 lb. in stock, was expected to precipitate an abrupt decline, but it did not occur. On the day previous to the report actual sales were made at 15.62½c. cash, New York, for prompt delivery metal. Prices hovered around this figure until the reduction came February 14. Despite their reluctance to load up with copper, American consumers are busy, and this constitutes the most hopeful note in the situation. Another is that consumers usually admit that they believe 15c. to be a fair price for copper. Exports from January 31 to February 21 amounted to 22,905 tons.

Lead

This metal was quoted, between February 1 and 21, without variance by New York sellers at 4.35c. New York and 4.20c. St. Louis. Dullness was a continuous feature in all this time. An effort was made early in the month by sellers in St. Louis to get slightly higher prices, and 4.22½c. was asked, but the move was not successful, as consumers found they could get plenty of lead at the lower price. Buyers appeared to be well supplied, and sellers were satisfied with conditions, and the market during the greater part of the month was without trend one way or the other.

Spelter

In February spelter lost over 50 points, there having been declines from about 6.80c. to 6.25c. New York. Indications were that still lower prices would be reached. Expectation of tariff change has affected spelter more seriously than some other metals, and with reason, in view of the fact that a few big galvanizers are using foreign spelter on products that are to go abroad and which are subject to a draw-back duty. The average price paid for brass-mill spelter in the Naugatuck valley in January was 7.56c. While the metal has repeatedly declined in price and February saw little new business, deliveries against contracts have been excellent, largely due to the quantities used by sheet mills. The lower price of the metal has naturally led to declines in prices of sheet zinc.

Antimony

There was little of interest in antimony throughout the greater part of the month. It is several points lower and was quoted February 21 at 9 to 9.25c. for Cookson's, 8.75 to 8.87½c. for Hallett's (8.87½c. being the import price), and 8.12½ to 8.25c. for Chinese and Hungarian grades. It is plain, as heretofore stated, that large quantities were bought on the rise of the market.

Aluminum

The light metal is quoted at 26 to 26.25c. for ton lots for remelting, guaranteed 98 to 99% pure. While the market is easier, it is off but a few points, and has held up well because of the heavy demand and the fact that the present sources of supply are taxed nearly to their full capacity.

Tin

Tin prices were sustained to a considerable degree in February through a fear that the excellent consumption and unprotected contracts would cause a shortage at the end of the month. In January 2700 tons was delivered into consumption, leaving stocks on hand, February 1, 1759 tons. In the first week of February unusually heavy sales were made, 600 tons having changed hands on February 4 alone. The business of the first week totaled at least 1200 tons, the deliveries ranging all the way to next August. Fair buying occurred on subsequent days also. At the beginning of the month the price left 50c. and has been down to 48.50c., standing February 19 at 49.25c. London prices have been as uncertain as ever, but declining rather steadily, a tendency which is attributed to bear selling. An example is the decline on London spot from £228 15s. January 31 to £219 10s. February 6. The imports this month to February 20 amounted to 2570 tons, and there was afloat at that time 4260 tons, with indications of about 3700 tons arriving in the entire month.

Cement manufacturers of the United States during 1912 had to put up with adverse business conditions during the first six months, and prices were lower than in 1911. Production from the various districts, as estimated by the U. S. Geological Survey, was as follows:

	Barrels.
Eastern Pennsylvania and New Jersey	24,449,523
Iowa and Missouri	7,557,090
California and Washington	7,258,542
Ohio and western Pennsylvania	7,239,775
Kansas, Oklahoma, central Texas	5,760,938
Maryland, Virginia, West Virginia, Tennessee, Georgia, Alabama	4,664,454
New York	4,490,180
Michigan and northeastern Indiana	4,519,726
Kentucky and southeastern Indiana	3,071,467
Colorado, Utah, Montana, western Texas	2,298,649

The total production was approximately 81,941,998 bbl., as against 78,528,637 bbl. in 1911, while stocks were reduced from about 12,000,000 to 9,200,000 barrels.

Calumet & Hecla has declared a quarterly dividend of $10 per share, payable March 20. Three months ago the dividend was $12 and one year ago $8. With the payment of this dividend stockholders will have received $121,050,000 in dividends since the formation of the company in 1871.

National Lead Co. has declared the regular quarterly dividend of 1¾% on preferred stock.

LOCAL METAL PRICES

San Francisco is not a primary market for the common metals except quicksilver. The prices quoted below therefore represent sales of small lots and are not such as an ore-producer could expect to realize. Ore contracts usually call for settlements on the basis of Eastern prices, less freight and treatment charges. The prices quoted are in cents per pound, except in the case of quicksilver, which is quoted in dollars per flask of 75 pounds.

San Francisco, February 27.

Antimony	12—12½c	Quicksilver (flask)	41
Electrolytic Copper	18—18¼c	Tin	53¼—54c
Pig Lead	4 60—5.55c	Spelter	8¼—8¾c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES

(By wire from New York.)

NEW YORK, February 27.—Copper is now quiet and steady, sellers being comfortably sold ahead are not pressing the market. Lead remains unchanged. Spelter prices are easier, consumers not buying for the future. Average daily prices for the past week, in cents per pound, based on wholesale transactions, standard brands, are given below.

Date.	Electrolytic Copper.	Lead.	Spelter. St. Louis	Silver, per oz.
Feb. 20	14.45	4.33	6.10	61⅜
" 21	14 15	4.33	6.10	61⅜
" 22	Holiday.	No market.		
" 23	Sunday.	No market.		
" 24	14.45	4.33	6.10	61
" 25	14.45	4.33	6.10	60⅜
" 26	14.45	4.33	6.10	60⅛

COPPER SURPLUS

Figures showing the visible supply of copper at the beginning of each month are now widely available. Below are given the amounts, in pounds, known to be available at the first of each of certain months.

		U. S.	European.

SILVER

Below is given the average New York quotation, in cents per ounce, of fine silver for the months indicated:

	1912.	1913.		1912.	1913.
Jan.	56.25	63.01	July	60.67	....
Feb.	59.06	61.25	Aug.	61.32	....
Mch.	58.37	....	Sept.	62.95	....
Apr.	59.20	....	Oct.	63.16	....
May	60.88	....	Nov.	62.73	....
June	61.29	....	Dec.	63.38	....

COPPER

Daily quotations on copper as published in this column represent average wholesale transactions on the New York market and refer to electrolytic copper. Lake copper commands normally from 1-5 to 1-4c. per lb. more. Below are average monthly quotations in cents per pound:

	1912.	1913.		1912.	1913.
Jan.	14.09	16.54	July	17.19	....
Feb.	14.08	14.93	Aug.	17.49	....
Mch	14.68	....	Sept.	17.56	....
Apr.	15.74	....	Oct.	17.32	....
May	16.03	....	Nov.	17.31	....
June	17.23	....	Dec.	17.37	....

LEAD

Lead is quoted ordinarily in cents per pound or dollars per hundred pounds delivered at St. Louis or New York. Below are the average New York quotations by months:

	1912.	1913.		1912.	1913.
Jan.	4.43	4.28	July	4.71	....
Feb.	4.03	4.33	Aug.	4.54	....
Mch.	4.07	....	Sept.	5.00	....
Apr.	4.20	....	Oct.	5.08	....
May	4.20	....	Nov.	4.91	....
June	4.40	....	Dec.	4.20	....

ZINC

Zinc is quoted as spelter, standard Western brands, and based upon St. Louis or New York delivery. While New York quotations, as a matter of convenience, are commonly used, relatively little spelter actually goes to or comes from New York. The bulk is shipped direct from the plants in the Mississippi Valley to manufacturers, due allowance being made for freight. New York daily quotations are published in this column each week. Below are given averages by months:

	1912.	1913.		1912.	1913.
Jan.	6.42	6.88	July	7.12	....
Feb.	6.50	6.13	Aug.	6.96	....
Mch.	6.57	....	Sept.	7.45	....
Apr.	6.63	....	Oct.	7.36	....
May	6.68	....	Nov.	7.23	....
June	6.88	....	Dec.	7.09	....

QUICKSILVER

The primary market for quicksilver is San Francisco, California, being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average monthly quotations, in dollars, per flask of 75 lb., are given below:

	1912.	1913.		1912.	1913.
Jan.	43.75	39.37	July	43.00	....
Feb.	46.00	41.00	Aug.	42.50	....
Mch.	46.00	....	Sept.	42.12	....
Apr.	42.25	....	Oct.	41.50	....
May	41.75	....	Nov.	41.50	....
June	41.30	....	Dec.	39.75	....

TIN

New York prices control in the American market for tin, since the metal is almost entirely imported. San Francisco quotations average about 5c. per lb. higher. Below are given average monthly New York quotations in cents per pound:

	1912.	1913.		1912.	1913.
Jan.	42.53	50.45	July	44.25	....
Feb.	42.96	49.07	Aug.	45.80	....
Mch.	42.58	....	Sept.	48.64	....
Apr.	43.92	....	Oct.	50.01	....
May	46.05	....	Nov.	49.92	....
June	45.76	....	Dec.	49.80	....

Current Prices for Chemicals

(Corrected monthly by Braun-Knecht-Heimann Co.)

Prices quoted are for ordinary quantities in packages as specified. For round lots lower prices may be expected, while in smaller quantities advanced prices are ordinarily charged. Prices named are subject to fluctuation. Other conditions govern Mexican and foreign business.

Company Reports

ASSOCIATED NORTHERN BLOCKS (W. A.), LTD.

This company owns 48 acres of mining property at Kalgoorlie, 93 at Ora Banda, 40 miles from the former centre, and 112 acres at El Refugio, Mexico. The mine at Kalgoorlie is now practically in the hands of lessees, the mill having been on custom ore for the past two years; the new mill at Ora Banda is in full operation; while in Mexico, the revolution has caused a suspension of work and it is proposed to lease the mine on a royalty basis.

The orebody in the Associated Northern mine is that well known shoot which outcropped in the Brown Hill lease, passed through a corner of the Brown Hill Extended and Cygnet leases, entered the Iron Duke at 360-ft. depth, leaving it and entering the Oroya North Block at 550 ft., and entering the Associated property at about 900-ft. depth, the full distance being about 2600 ft. It may be described as a pipe-like shoot of lenticular cross-section, the major axis of the lens dipping west about 30°, while the general course of the pipe, on plan, is nearly due south, with a descending pitch in that direction of about 1 in 3. The core of this shoot was very rich, containing large quantities of tellurides and free gold. In the mines mentioned, save a little ore in the Associated Northern and Oroya, the shoot has been worked out, after producing approximately 1,400,000 tons of ore, yielding $33,000,000, and paying $15,000,000 in dividends, the figures for the company under review being 347,395 tons, worth $8,000,000, and yielding $3,300,000 in dividends.

During the year ended September 30, 1912, the Kalgoorlie mill treated 27,768 tons of mine and custom ore, worth $480,000, the profit being $82,000. The Oro Banda mine has been equipped with a plant capable of treating 300 tons per day, comprising rock-crusher, Huntington mills, grinding-pans, pulp-thickeners, Ridgway vacuum-filters, and zinc-shaving precipitation. It is driven by two 108 and one 37-hp. Tangye gas-engines. The mine is equipped for work to 600-ft. depth, and ore reserves total 200,000 tons, worth $4.80 per ton. On No. 4 level a rich oxidized ore formation was recently cut, the drift being out 160 ft., the last 20 ft. averaging $55.20 per ton, over a width of 5 ft. Costs at this new mine are: mining, $1; treatment, $1.26; and general expenses, $0.25 per ton. El Refugio mine has 60,000 tons of ore worth $10.20 per ton, in the proportions of gold 60% and silver 40%. During the year, 987 ft. of development was done, including 501 ft. of drilling. In connection with the latter work, a firm in Mexico City had a contract to drill 2000 ft., but at 920 ft. they suddenly quit the district and actually left in the hole their diamond-drill and 315 ft. of rods. G. M. Roberts is manager in Western Australia, and W. E. Simpson in Mexico.

MINERALS SEPARATION, LTD.

This company was formed in 1903 to carry on metallurgical operations, and the purchase price of certain patents was $120,000. Plants with a large capacity are at work at the Sulphide Corporation's Central mine, the Zinc Corporation's plant at Broken Hill, and the Great Fitzroy copper mine, Queensland. The authorized capital of the company is $240,000. The seventh annual meeting was held in London on December 20, 1912. During the year the Minerals Separation and De Bavay's Processes Australian Proprietary, Ltd., in which the company's Australian interests have been merged, was incorporated, and took over the Australian staff and business on July 1. Business anticipations have been realized and a dividend of 10% per annum has been declared on the first quarter's work. The Minerals Separation American Syndicate has renewed its option for another year, as from October 10, 1912, on payment of $24,000. Prospects of this subsidiary are promising. Two important licenses have been granted, tests undertaken, and contracts for others are in process of negotiation. At the Braden mine, Chile, results have been satisfactory; and the Braden company has not only refunded the outlay incurred by the Minerals Separation, but has ordered a plant to treat 3000 tons of ore daily, the first unit of 600 tons being at work. In Sweden, a 150-ton plant has been erected at a well known mine, and profits are now being made. As regards litigation, the Australian amalgamation has settled all pending actions to which this company was a party, and has strengthened the position against future attempts at infringement. In the action brought against Mr. Hyde for infringement in the United States, much evidence has been taken, and the suit will be heard at Butte before March. Research and experimental work is being carried on with good results. During the year ended December 31, 1911, the revenue from royalties and profits from tailing treated was $130,000, and sundry, $4600. Management, traveling, examinations in England and abroad cost $77,000; patent renewal fees, $11,000, London adminstration $27,000, and depreciation, $4700, leaving a balance of $14,900.

Costs at the Ivanhoe Mine, Kalgoorlie

Work at this important mine consists of development down to a depth of 2600 ft., and stoping ore on one to four lodes down to 2420 ft.; treating the ore in a 100-stamp mill, embodying concentration, grinding in pans and tube-mills, separation, cyaniding sand by percolation, slime by bromo-cyanide, and filter-pressing; and roasting of the concentrate, followed by agitation and filter-pressing, all gold being precipitated on zinc shaving.

COST PER TON TREATED

Treatment:		Mining:	
Rock-crusher	$0.08	Breaking ore	$1.25
Ore transport	0.03	Filling stopes	0.26
Stamping	0.40	Tramming and hoisting ore	0.48
Concentrating	0.14		
Roasting concentrate	0.12	Mine total	$1.99
Grinding "	0.03		
Cyanding "	0.10		
Grinding sand	0.15	Development	0.58
Cyaniding "	0.18	General expenses	0.33
Agitating slime	0.38	Charges on bullion	0.09
Filter-pressing	0.14	Buildings, equipment	0.08
Precipitation, clean-up	0.08	Total cost	$5.02
Disposal of residue	0.12		
Mill total	$1.95		

PREMIER DIAMOND CO. treated 9,707,098 loads, of 1600 lb. each, during the year ended October 31, 1912, yielding 1,992,474 carats of diamonds, or 0.205 carat per load. The value per carat was $4.83, making the value of production $9,623,650. The value per load was 99c., and cost 57c. for treatment. The yield is 218,268 carats greater than in 1911, but the value per carat is 96c. higher. The profit for the year was $3,350,000, of which the Union Government of South Africa gets 60% and the shareholders 40%. In commemoration of the tenth year of its existence, the company has created a provident and pension fund, which will provide for those who grow aged or incapacitated in the employ of the company. The fund has $400,000 to start with.

MINING in Portugal is receiving more attention, although as yet the results are not large. The Government is desirous of exploiting and opening up the mineral wealth of the country and has consequently reduced the tax on mining from 3 to 2%, and has offered a reduction of 20% in the freight rates on government railroads to any concern shipping 25,000 tons of ore from one locality within one year. The total mining output of Portugal for 1911 was valued at $1,889,670. The production of tungsten, in which Portugal leads the rest of Europe, amounted to $438,650, while the production of copper was valued at $437,737, and the production of sulphur ore netted $620,454. The mines of Portugal are still largely undeveloped.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

COPPER production of Canada in 1912 was 33,000 long tons.

CONDENSING steam requires about 30 lb. of water to 1 lb. of steam.

COPPER production of Peru in 1912 was 27,400 long tons, as against 26,000 in 1911.

SLIDES at the Panama canal during January will necessitate the removal of about 1,000,000 cu. yd. of additional ground.

LUMBER production of the United States in 1912 was approximately 40,000,000,000 ft., of which 14,144,000,000 ft. was yellow pine.

FLOTATION treatment of copper ore at the Great Cobar mine, New South Wales, requires about ½ lb. of eucalyptus oil per ton treated.

FUSEL OIL is produced in considerable quantities from molasses in a plant at Toronto which treats 30,000 to 40,000 tons of the latter product per year.

RADIUM-BROMIDE is prepared in Sydney, Australia, by the Radium Hill Co., which has produced 2.5 mm. of a purity of 1,800,000 to 2,000,000 radio-activity. In the laboratory there is 350 mm. in various stages of purity.

MINERAL PRODUCTION of British Columbia to the end of 1912 totals $403,303,000. From 1852 to 1902 it was $189,729,000; and from 1902 to 1913 it was $240,574,000. Coal production of Vancouver Island in 1912 was 1,553,000 tons.

RAILROADS of the United States added to their equipment in 1912, 148,357 freight cars, 238 passenger cars, and 4677 locomotives, as against 72,161, 4246, and 3530, respectively, in 1911. During the year, 4072, 2822, and 238 were exported.

AMMONIA SULPHATE production in 1912 was: Germany, 465,000 tons; England, 379,000; France, 68,500; Belgium, 49,500; United States, 165,000; Austria-Hungary, and the rest of Europe, 170,000; the total for the world being 1,300,000 tons.

KOREA, which has a population of 11,000,000 people, has only 7 automobiles, the latest one being purchased by an American mining man to use in inspecting mining properties. This country has an area of 71,000 square miles, but has few good roads suitable for motor cars.

SCUM gathered from the surface of water and treated with hydrochloric acid to find out whether it is iron oxide or oil, may be tested by a less cumbersome method by giving the scum a sharp blow, when, if iron oxide, it breaks into permanently separate angular flakes. If the scum be oil, these soon flow together again and appear as before.

BELL CONES, mentioned by Alfred James in 'Progress in Gold-Silver Ore Treatment in 1912' in the *Mining and Scientific Press* of January 4, are used at the Palmarejo & Mexican new mill for feeding tube-mills. They are similar to Caldecott cones, but have a conical drum inside in place of a diaphragm. In point of date, they are perhaps earlier than the Caldecott type, and are the invention of J. W. Bell, of the McGill Metallurgical Laboratory, Montreal, Canada.

CATERPILLAR traction-engines have been used in a number of places where by reason of the presence of sand or soft bottom, haulage by ordinary means was impossible or difficult. A recent unusual application of the caterpillar is to a Bucyrus drag-line excavator used for stripping phosphate rock at Mount Pleasant, Tennessee. It is reported to work satisfactorily, even in mud half-way up the frames. On the Los Angeles aqueduct a large number of caterpillar engines were used on the desert. While demurrage and repairs were high, such extensive haulage by mules over the desert would have been nearly impossible.

TAILING resulting from milling a given block of ore cannot all be replaced in a mine in the stope from which the ore originally came. This becomes apparent when it is considered that a cubic foot of solid quartz weighs 165 lb., whereas a cubic foot of quartz sand weighs about 106 to 110 lb. This indicates that only about two-thirds of the tailing can be replaced in the stope. This, however, in California mines, would in most cases be no great disadvantage, as almost every mine has already extensive open workings into which the extra one-third of the sand could be stored, so that it would, generally speaking, be a long time before the excess output of the mill would become troublesome.

SEWAGE generally consists of 998 parts of water, 1 of mineral matter, and 1 of organic matter, the germ life being contained in 0.1 of 1% of organic matter. In the Chemulpo sewage disposal system, the Moore filter is used with success. Not over 15-in. vacuum is maintained and discharged cakes contain 40% moisture. This system requires 240 sq. ft. of surface per 1,000,000 gal. of sewage per day, and one man can handle 1,000,000 to 30,000,000 gal. per shift, the cost being $5.50 to $7.50 per 1,000,000 gal. treated. Sand filtration requires one acre for 30,000 gal. per 24 hr.; and continuous filters, the sewage having been previously treated by some process, will deal with 500,000 to 2,000,000 gal. per day.

SAND FILLING of stopes involves consideration of the angle of dip of a vein, the method of mining in vogue, and the situation of the available sand deposit, or the mill from which the tailing flows with relation to the shaft or other passage through which the sand must pass to the underground workings to be filled. In Westphalia, Germany, the workings of the Shamrock mine are 1900 ft. deep, and sand is carried 1500 ft. horizontally from the shaft underground and deposited. At the Myslowitz colliery, 3000 tons of sand per day is sent below, to fill openings in coal seams from 8 to 37 ft. thick. The sand is sent down through two bore-holes, one 780 ft. and the other 1100 ft. deep, from which it is distributed to the openings. In many collieries crushed rock is used instead of sand.

GOLD LEAF is made by a new process, introduced by a London firm, in which a highly polished aluminum ring about 5 ft. diam. and 5½ in. wide is covered with an adhesive substance, such as a solution of gum, and is allowed to dry. The adhesive surface is dusted with metallic powder so that it is covered with a very thin layer of base metal. This layer is polished and the ring is coated slowly with its lower surface in contact with a solution of nickel salt, the ring being connected with one pole of a battery, while the other pole is immersed in the nickel solution. An electro-deposit of nickel is thus produced on the polished layer of base metal. The nickel deposit is washed and the ring is rotated with its surface in contact with a solution of gold, the electrical connections being as before, so that the latter metal is electroplated on the nickel. There are thus four layers on the periphery of the ring, namely, gum, base metal, nickel, and gold, but each layer of metal is so thin that the combination is said to be even thinner than the best gold leaf. To remove the aluminum ring, a transverse cut is made in the continuous film, and, starting from this cut, the ring is rotated slowly with its lower part immersed in a liquid which dissolves the adhesive substance, when the film falls from it and is received upon a band of paper traveling at the same speed as the periphery of the ring. The film and paper are then cut up and made into books.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

TAXATION OF MINING COMPANIES

A company engaged in the business of drilling for and extracting oil is held to be following a mining pursuit within the meaning of the statute levying a license tax upon persons, firms, or corporations engaged in the business of selling timber and minerals from the soil.

Etchison Drilling Co. *v.* Flournoy, (Louisiana) 59 Southern 837. November 4, 1912.

GAS LEASE—ASSIGNMENT ADMITTED

Where the gas leases on which defendant was sued, as assignee, were in its possession when plaintiff directed its president to execute certain contracts with reference to drilling other wells on the land, a recognition in the contracts that the land was held by defendant under an assignment must be considered as an admission by it of such assignment.

Indiana Nat. Gas & Oil. Co. *v.* Duling, (Indiana) 100 Northeastern, 96. (Dec. 13, 1912.)

INSUFFICIENT DISCOVERY

The location of a lode mining claim must be supported by the discovery of the vein or lode within the limits of the claim located: and the exposure of substantially worthless deposits on the surface of a claim which from observation and geological inference are supposed to indicate that other and unconnected veins or lodes lie at a greater depth, does not constitute a discovery within contemplation of the law, and is not a sufficient basis for a valid location. Obviously, the words "the vein or lode" can only refer to the lode which it is expected to develop and mine, and cannot refer to disconnected bodies of ore of no possible value in themselves.

East Tintic Consolidated Mining Co. (on rehearing), 41 Land Decisions, 255. September 5, 1912.

ASSOCIATION PLACER—RIGHTS BEFORE DISCOVERY

The law does not require assessment work to be done on each 20 acres of an association placer claim. An entry upon a mining claim before a prior locator is in default cannot be made for the purpose of making a provisional location to be valid in case the prior locator fails to do the annual work. When six of the eight association locators agree after the location of the claim and discovery of gold thereon to give one of the remaining locators more than a 20-acre interest, such agreement does not invalidate the location. The law gives to the locator of mineral ground before discovery, and while he complies with the federal and local statutes and regulations, the valuable right of possession against all intruders, and this right he can convey to another.

Rooney *v.* Barnette (Alaska), 200 Federal, 700. (Oct. 7, 1912.)

MINING CASE—LIABILITY OF CO-LESSEE

Plaintiff owned a two-thirds and defendant a one-third interest in a certain mining lease. Plaintiff agreed orally with defendant to assign to him one-half of his two-thirds interest in the lease in consideration of defendant's paying one-third of the expense of performing the annual work on seven claims as required by the terms of the original lease. Thereupon plaintiff executed the assignment and delivered it to the defendant and went ahead with the assessment work. Defendant sought to evade payment of the one-third of the expense on the grounds that his contract with plaintiff was not in writing, but the court held that even were this so, the defendant was nevertheless liable under the original lease for one-third of the expense of assessment work, and gave judgment for plaintiff accordingly.

Girton *v.* Daniels (Nevada Supreme Court). Feb. 1, 1913. (Not yet reported.)

Self-Starting Direct-Current Motors for Driving Mine Pumps and Fans

The electric motor has proved so thoroughly satisfactory for driving mine pumps and fans that it seems almost impossible to improve it. It can be placed wherever a pump or a fan can be set; a couple of wires supply it with the power it needs; and while running it requires no attention whatever beyond occasional inspection and oiling. In fact, motors have proved themselves so useful and economical that they are rapidly displacing all other forms of power for fan and pump service wherever electricity is available. An improvement has, however, been recently developed which greatly increases the value of motors for mine work. This improvement consists in making the direct-current motor self-starting.

Heretofore, while it has been possible under some conditions to start them from the power-house, most motors driving mine pumps and fans had to be started by hand. Hence, if the power went off temporarily for any reason, the motors stopped, necessitating an attendant going to each station to start them again.

With the new self-starting D.C. motors, this inconvenience is done away with. When the power fails, the motors stop, but as soon as the power comes on again, the motors start automatically and settle down to work as though nothing had happened. Moreover, starting boxes are rendered unnecessary, and the wiring is of the simplest possible character. An occasional visit of inspection is now all the motors require. Otherwise they can be left entirely to themselves.

These motors have been thoroughly tried out in practical service and their users are commending them highly, as is shown by the number of repeat orders the manufacturers are obtaining. The electrical characteristics of the self-starting motor differ but little from those of the usual type, the only alteration being in the use of a heavier compounding winding which reduces the flow of current when starting. Mechanically, there is no change. Self-starting motors are made by the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pennsylvania, in ratings up to 20 hp. for the voltages usually employed in mine work. They can be supplied for all kinds of fan and pump service.

A New Smoke-Helmet

At Engine House No. 1, of the San Francisco Fire Department, some interesting tests were made on January 17 with the Chapin smoke-helmet, the patented invention of C. E. Chapin of that city. There are already several good types of helmets and apparatus in use which depend on chemicals for a proper supply of oxygen for the wearer and for the absorption of CO_2 expelled from the lungs. The Chapin apparatus uses air and is rather simple, an important consideration in rescue operations. It consists of the following: A pair of cylinders about 3 by 12 in., by ⅛ in. thickness of pressed steel, tested to 3400 lb. pressure, but safe with a working pressure of 2000 lb. per square inch, such as are used to store nitrous oxide gas for dentists. The pair is clamped and strapped together on the back, and each is fitted with a safety valve and a regulating valve for supply to the helmet. The latter valve may be set to any desired quantity, or may be regulated at will by the user. The cylinders are charged with air to 1700 lb. pressure, and will supply a man for 40 minutes, or if working hard, about 30 minutes. The helmet consists of close canvas lined with thin rubber sheeting, in which are inserted two 'eyes' of glass and a small valve which is placed just about opposite the user's mouth, and is adjusted so that it requires no effort to expel the CO_2 breathed out. The helmet is strapped around the neck and is attached to the air-receivers by a flexible metallic tube of about ⅛-in. bore. In operation, the air from only one receiver is used at a time, and this expands in the helmet when turned on, and regulating is easily done, as shown in the accompanying cut. The whole apparatus weighs 22 lb., and costs about

$100. At the engine-house, a concrete building about 12 by 24 by 10 ft. was used in the tests, and in it was burned a mixture of oily cotton waste, straw, sulphur, and cayenne pepper, which made a dense fume through which objects were not visible more than two feet. Tests lasted five and six minutes each, and the wearers of the helmet emerged

CHAPIN SMOKE-HELMET.

from the fume without having felt any discomfort either from heat about the head, smell of the fume, or lack of air-supply. A fire call put an end to further tests for the day. On the transport *Logan* a 20-min. test was made in a similar mixture, with equally satisfactory result. Around mines, there is room for a simple contrivance such as this. Oxygen may be stored in the cylinders, but air is better, and, where compressed-air locomotives are used, high-pressure air is available.

Commercial Paragraphs

THE BALBACH SMELTING & REFINING CO., of Newark, New Jersey, has installed at 4½-ft. Hardinge conical ball-mill to replace a battery of ten stamps.

The H. W. JOHNS-MANVILLE Co. announces the removal of its Newark, New Jersey, office to 239 Halsey street. Also that it has opened a branch office in the Dooly block, Salt Lake City, Utah.

HARDINGE CONICAL MILL CO., of New York, has received orders for two 8-ft. Hardinge patent conical pebble mills from the Butte & Superior Copper Co., of Montana, and for three mills of the same size from the Commonwealth Mining & Milling Co., of Arizona.

L. L. SCOTT, of St. Louis, is introducing a new gasoline drill made in four sizes and ranging in weight from 35 to 265 lb. The drilling engine works on the two-cycle principle, the hammer piston, made of vanadium steel, being acted upon directly by the explosive mixture. The piston is drawn back by the stored energy of a fly-wheel. Either solid or hollow steel may be used and the hole may be cleaned by the gases of explosion driven through the hollow steel. It is claimed that the largest machine will drill 3 to 15 inches per minute with a gasoline consumption of one gallon in five hours.

THE GANDY BELTING CO., Baltimore, Maryland, reports the following performance of an 8-ply 26-in. Gandy belt at the plant of the Bessemer Fire Brick Co. of Birmingham, Alabama. The above belt has been in operation for over 27 years, during which time the plant has not been shut down except for repairs to the machinery. The driving belt recently pulled out at the old lace holes, where leather lacings were formerly used and later changed to belt hooks. This is the first time the belt has given any trouble in the manufacture of over 140,000,000 fire-bricks that have been turned out during its service. The owners are simply splicing on a new piece of belt to repair the damage and the belt has continued in service and looks good for a long time to come.

The telephone, though only thirty-seven years of age, has probably developed more in that short time than any of its humanity-helping contemporaries. Its history has been shown in an interesting way by the exhibit of historical and modern telephone apparatus and supplies recently inaugurated at New York by the WESTERN ELECTRIC Co. The historical section shows the development of the telephone from its earliest stages up to the present time. The smoked-glass records of sound waves made by Alexander Graham Bell, in 1874, using the human ear as a transmitting diaphragm and thus proving that diaphragms would transmit sound waves; parts of Bell's original telephone of 1876, mounted to make a complete model, and numerous instruments showing the gradual improvement in design, are exhibited to great advantage in large glass cabinets with placards giving a description of each article. Included in the historical collection, which is composed partly of apparatus loaned by the American Telephone & Telegraph Co. and partly of Western Electric apparatus, are the switchboard used by Mr. Bell in opening the New York-Chicago line in 1892, and the receivers and transmitters used at the opening of the New York-Denver line in 1911. The modern apparatus section contains switchboards, magneto, and central battery, each switchboard having wired to it a number of telephone sets, so that service demonstrations may be made to visitors.

Catalogues Received

OTIS ELEVATOR Co., New York. 'Incline Railways.' 28 pages. Illustrated. 6 by 9 inches.

THOMPSON BALANCE Co., Denver, Colorado. 'Precision Balances and Weights.' 28 pages. Illustrated. 6 by 9 inches.

DENVER FIRE CLAY Co., Denver, Colorado. Bulletin No. 115. 'Case Oil Muffle Type Furnaces.' 6 pages. Illustrated. 6 by 9 inches.

A. C. CAMERON STEAM PUMP WORKS, 11 Broadway, New York. Booklet on Cameron steam pumps. 48 pages. Illustrated. 3 by 5 inches.

W. S. TYLER Co., Cleveland, Ohio. Catalogue No. 40, describing Tyler wire cloth and screens. 115 pages. Illustrated. 8 by 10 inches.

CHALMERS & WILLIAMS, Chicago Heights, Illinois. Pamphlet describing the 'Torpedo Conveyor.' 4 pages. Illustrated. 6½ by 6 inches.

SPRAGUE ELECTRICAL WORKS, 527 West 34th St., New York. Pamphlet No. 117, 'Sprague Electric Products.' 24 pages. Illustrated. 4 by 9 inches.

JEFFERY MFG. Co., Columbus, Ohio. Bulletin No. 46. 'Jeffrey Swing Hammer Pulverizer for Laboratory Use.' 4 pages. Illustrated. 6 by 9 inches.

FORT WAYNE ELECTRIC WORKS, Fort Wayne, Indiana. 'Fractional Horse-Power Motors and Their Applications.' 28 pages. Illustrated. 8 by 11 inches.

JOSEPH DIXON CRUCIBLE Co., Jersey City, New Jersey. 'Production Catalogue' describing the Dixon line of graphite products. 100 pages. Illustrated.

CENTRAL FOUNDRY Co., 90 West St., New York. Booklets describing 'Universal Pipe' and the equipment needed for laying same. Illustrated. 3½ by 6 inches.

CENTRAL FOUNDRY Co., 90 West St., New York. Reprint of article entitled 'High Pressure Fire Mains in Philadelphia.' 4 pages. Illustrated. 3½ by 6¼ inches.

CHICAGO PNEUMATIC TOOL Co., Fisher Bdg., Chicago. Bulletin No. 124, 'Pneumatic Riveting, Chipping, Calking, and Stone Hammers.' 24 pages. Illustrated. 6 by 9 inches.

EDGAR ALLEN AMERICAN MANGANESE STEEL Co., McCormick Bdg., Chicago. Bulletin No. 55, 'Steam-Shovel and Dipper Dredge Repair Parts.' 20 pages. Illustrated. 6 by 9 inches.

TABLE OF CONTENTS

EDITORIAL

"THIS is a day not of triumph; it is a day of dedication," said Mr. Woodrow Wilson on taking his place as President of the United States. A keynote so suggestive of Lincoln's mental attitude augurs well for the new administration.

AMENDMENT to the Arizona miners' lien law is proposed, to the extent that an owner may be relieved from debts incurred by lessees, on posting conspicuously on the property a notice disclaiming such responsibility; an entirely proper provision.

SCIENTIFIC men of the Pacific coast will meet at the University of California April 10, 11, and 12, in connection with the sessions of the Pacific Association of Scientific Societies. The Cordilleran Section of the Geological Society of America will hold sessions on the days mentioned.

EXTRALATERAL rights are a perennial source of trouble, and mining men are generally in favor of their abolishment. We are glad to present this week an informing discussion by Mr. L. G. Campbell, who treats the subject from the point of view of a lawyer thoroughly familiar with the imperfections of the present law.

ALASKA, after many years of waiting, now has a legislature. The eight senators and eight representatives who constitute the new legislative body, assembled at Juneau for formal organization March 3. No doubt errors will be made, but it is good American doctrine to let each one make his own mistakes, and there are many points of law that none but a local assembly could ever be expected to rectify.

ESTIMATED February production of the Goldfield Consolidated Mines Company was 26,970 tons, of which the gross value was $513,000, the operating expense $165,000, and the net realization $348,000. Final figures for February showed a production of 27,169 tons, gross value $535,736, and net realization $327,956. These figures would be considered excellent for any property except the Goldfield, which has spoiled its friends by doing so unusually well. We are glad to note that payment of dividends has been resumed.

REFERENCE to the Bully Hill smelter in the report by Mr. J. Nelson Nevius, on another page, brings up the matter of electric smelting, since the Bully Hill company has been experimenting both with this process and with leaching. We understand that excellent progress is being made in the development of a wet process for handling the complicated

copper-zinc ore found at Bully Hill, and we hope that it may soon be put in operation on a full working scale. In the meantime one of our cherished desk ornaments is a small ingot of zinc made from California ores by the wet process now undergoing trial. Success of such a method of treatment will go far toward solving present smelting troubles.

ENGINEERS in San Francisco organized last May a luncheon club where men of all branches of the profession might meet and strengthen acquaintance. Permanent quarters at the Palace Hotel being unavailable, rooms have been found in the Balboa building and will be promptly fitted up for regular headquarters, with service from an excellent café in the same building.

VETO of the Sundry Civil Bill by Mr. Taft leaves the Geological Survey, Bureau of Mines, and many other important branches of the government service without funds after June 30 next. Fortunately it has already been announced that a special session of Congress is to be called, and doubtless provision will be made for enactment of a new bill. The difficulty could be easily avoided by Congress giving the President the right to veto individual items in a bill, as is done in many states.

SOUTH AMERICANS propose the formation of an A B C *entente* to include the Argentine, Brazilian, and Chilean republics. Such an alliance of the three great countries to the south would make greatly for peace and stability on the neighboring continent, and, while to South Americans it makes its strongest appeal in that it would form a power strong enough if necessary to oppose the United States, we believe it would be welcomed by North Americans. In the light of our occasionally unfortunate diplomatic history, it is hard for South Americans to believe that their big brother of the north only wishes peace and stability with the conquests of commerce rather than politics. Anyone who knows intimately the people of the United States, however, realizes that this is true, however poorly informed our people may be as to South American affairs and however obsessed with the notion of an indefinitely enlarged Monroe doctrine.

Settling Smelter-Fume Problems

Litigation over smelter-fume damage has been in recent years a prolific source of annoyance and expense to smelting companies, especially those operating in the Western states. On another page Mr. J. Nelson Nevius re-tells the story of the contest in Shasta county, California, and describes the present conditions—only one plant running and it operating at increased cost and decreased capacity with still murmurs of discontent. This is a serious matter not only to the smelting men, but to the miners who, in decreased market and higher treatment charges, must ultimately pay the bill. How far-reaching are the results is illustrated by the circumstance that the Chamber of Mines and Oil at Los Angeles, several hundred miles from the affected district, employed an engineer to study and report on the situation because of its influence on mining in general. Mr. Nevius, in his report, presents both sides of the case. No one familiar with the situation can doubt that the smelters have in recent years made earnest effort to prevent damage from fume. To a large extent they have been successful, and yet there are persistent opponents of the smelting companies who stoutly maintain that not only is damage being done, but that the smelters are not in good faith attempting to prevent emission of damaging fumes. Smelting men feel that in this they are misjudged, and that the bulk of the present claims for damage are from professional 'smoke farmers.' They point to the fact that in many cases men, extremely solicitous as to damage to crops and who complain loudly as to the nuisance arising from odors, become contented tenants when they have sold their lands to the smelting companies at a good price. In the Deer Lodge valley of Montana, the Amalgamated company has itself gone into agriculture in the midst of the smoke belt, and prizes for animals, fruits, and vegetables raised on the company farms are regularly won at agricultural exhibitions. We have heard of dead cattle being purchased and hauled at night to farms in the smoke belt where a plausible claim for their death might be laid. We have also heard of furnaces that gave a much higher duty at night, when smoke could not be seen, than in the day time. There has been entirely too much of misinformation, misunderstanding, and perhaps of sharp practice, and we are glad to see signs of a much better order.

Managers of smelting plants now make much more effort, and more sympathetic effort, to understand the damage done by fumes. The large companies maintain on their staffs agricultural chemists, soil experts, botanists, and foresters, and attempt to know for themselves the exact measure of damage. As might naturally have been anticipated, they find that the smelters have been charged with, and have frequently paid for, damage due to frost, drouth, hot winds, insects, and a large number of other causes. This has naturally made them skeptical as to damage claims. Generally speaking, they are willing and ready to pay for any real damage, and merely ask that the relative value of the smelting industry and the damage done be weighed in determining whether a plant must be closed. Unfortunately, perhaps, the matter is not so simple from a legal point of view. No one has the right to maintain a nuisance, regardless of the value of the resulting product. Residents in an aristocratic suburb resent establishment of a livery stable or a pig-sty on a neighbor's front lawn, and the farmers in Salt Lake valley felt the same about the coming of the smelters. Relative value does not enter into the question: it is merely a question of fact as to whether the smelter is a nuisance.

Damage from smelter fumes arises, broadly, from four sources: (1) Minute particles of poisonous substances, such as arsenic or lead, spread broadcast through the air; (2) dust of any nature which operates mechanically to injure buds and young fruit or other tender parts of growing plants; (3)

SO_3, which, in moist air unites with water to form sulphuric acid; (4) SO_2, which, under certain conditions, also injures plant life, though to a less extent. In addition, there is in instances the matter of offensive odors. There is little question that in the past large damage was locally done by emission of arsenic and similar metallic particles. These can and should be precipitated and saved; fortunately, this may usually be done at a profit. Inert dust from smelters is no worse than that raised by winds or emitted from other industrial plants. The damage is of the same sort as is created by black smoke in cities. It can be largely prevented at a not prohibitive cost, but there is room for a 'rule of reason' in the speed of abatement of this nuisance. The sulphur fumes are best handled by utilizing them to make acid. Unfortunately, this is not economically feasible at many points. The SO_3 can be neutralized and precipitated or caught in bag-houses as a sulphate. It may also be directly precipitated by the Cottrell process of electrical precipitation. It is probably not unreasonable to ask that it be so treated. The SO_2, however, affords another problem. It is more abundant and harder to treat. At present there is no widely applicable method of neutralizing it. At the Ashio smelter in Japan milk of lime is used with fair results, and at Campo Seco the Thiogen process is being developed. At most plants the only feasible plan now open is to dilute the fume by blowing additional air in at the bottom of the stack. The result is perhaps not entirely satisfactory, but it must be remembered that the amount of damage due to SO_2 is uncertain and probably small. The matter of odors is one into which the personal equation enters largely. On San Francisco bay it was found that the odor came, not from the smelting plant, but from the oil refineries, and in general, complaints on this score are not important.

The smelting companies have been spending large sums to get at the bottom of these various matters and are conducting extensive experiments at present. They are as anxious to avoid or minimize damage as any one. One especially commendable move lately made has been to join in creating non-partisan investigating commissions of technical men to study the particular plants, to recommend any changes that may seem desirable, and to report to the courts if the smelters are failing in any particular to live up to the law as regards noxious fumes. The first of these commissions was created in Montana to study the great plant at Anaconda. It includes Messrs. L. D. Ricketts, J. A. Holmes, and John Hays Hammond, and its employees have now been busy some months in the plant. They are given every facility and full authority to get at the facts, and the report of the commission will be conclusive because of this fact and the high character and attainments of the men composing it. In California a bitter warfare has been waged on the Selby Smelting & Lead Company by certain residents of Benicia who allege great damage as a result of smelter fume. The company has bought easements, made changes in its plant, diverted shipments of high-sulphur ore, and spent large sums of money on investigators, experiments, and in litigation. Still the complaints have continued, and the officers of the concern feel that these are now entirely unjustified. Following the example of the Anaconda, and with the approval of the United States court before whom the matter comes for trial, the company recently asked for appointment of an expert commission to examine and report upon their methods of treatment and the actual measure of damage. In effect, the officers of the company lay their cards on the table face up and ask what more can be done. An excellent commission has just been appointed. It is headed by Mr. J. A. Holmes, director of the United States Bureau of Mines, and with whom is associated Mr. W. F. Snow, secretary of the State Board of Health, and Mr. Ralph A. Gould, whose experience as chemist and expert for the farmers in their Shasta county litigation renders him especially familiar with local problems. It is anticipated that a report will be completed in three months and it ought to have the effect of authoritatively settling the question at issue. Certainly technical matters of fact are much better determined by such expert commissions than by the ordinary jury with the incomplete and distorted information put before them in the course of a trial at law, and the attitude of the litigants in providing for such commission is a welcome sign of a disposition to get at and respect the facts of the case.

Gold-Dredging and Land Destruction

Conservation is a subject in which we take large interest, and we are proud to claim a place among conservationists. We regret to see the force of a great movement dissipated in a too frequent tilting at wind-mills. A case in point, as we see it, is the proposed regulation of gold-dredging in California, discussed in detail on another page by Mr. Charles Janin. Comparison of the benefits of this great industry with the maximum saving possible, one-eightieth of one per cent of the arable land, brings forcibly to mind the man who burned his house to get rid of one mouse. Land protection is a great need, and soil preservation demands much thought and study, but it is still to be shown even that the land dredged is permanently destroyed. There is much evidence to the contrary, and it is fairer to look upon it as temporarily withdrawn from cultivation. In the meanwhile road-side ditches and hill-side cultivation, to say nothing of unregulated streams, annually destroys much more land. Why hamper an important and profitable industry on a contingency when there are so many more important and probably fruitful fields for activity? California lost one great mining industry by the process of regulation that abolished, and is in process of losing a smelting. Gold-dredging is peculiarly a California industry. Nowhere else in the world has it been conducted on the scale and with the success that has been reached in the Golden State. At best it is a temporary enterprise, and it is furnishing the capital necessary to put other industries, notably agriculture, on a sound permanent basis. We hope the proposed bill will be killed, as it should.

Should the Extralateral Vein Right be Abolished?

By L. G. Campbell

*For the purpose of this discussion, let it be remembered that we of the bar have a hand in the construction of a great system of jurisprudence that will stand for centuries to come—one principle upon another, each laid with the cement of justice to endure for all time. Let us also, for this discussion, see the mining states of this great West with a population of twenty times that of the present; with twenty prospectors on hills where one now follows his burros over a dusty trail. Increased prospectors means increased discoveries and an increased number of locations of mining claims. At that time, as now in a smaller degree, it must be realized that definite property rights are essential to the progress of the metalliferous mining industry. Plainly, it is the duty of Congress, as well as other legislative bodies, to enact such laws as will, as far as possible, avert litigation and establish and fix definitely property rights. Surely also, it is the duty of the legal profession to encourage the passage of such laws. As a profession it is faithful to that duty, notwithstanding the oft expressed but unfounded statement that lawyers are fomenters of litigation.

Definition of Extralateral Right

Were I discussing this subject before attorneys of non-mineral states, it would be proper to define the extralateral right as that right given by the laws of the United States to the proprietor of a lode mining claim, to follow veins having their tops or apices within his claim lines, indefinitely to the depths, even though the dip of such veins from the vertical carries them beyond a vertical plane drawn downward from the side-line of his claim beyond which such veins dip; but before you, who are familiar with that law, to define discovery, strike, end-lines, side-line, apex, dip, and extralateral right, would uselessly consume time.

The history of the extralateral vein right seems to indicate that many generations ago that right, in somewhat different form, was permitted by the mining laws of Spain, but whatever it may have been, it was long since abolished. The system was for a time used in British Columbia, but was abolished sixteen years ago. In the sixteenth and seventeenth centuries Germany had in its laws what may be translated "an extended field," or more liberally, "an inclined location"; that is, the proprietor of a tract of mining ground was permitted to follow the vein apexing within it, downward indefinitely on its dip, and with the dip went also the bounding planes of the tract on the same dip, limited perhaps to 30 ft. on either side of the vein. The right, however, in Germany was abolished years ago, and C. H. Lindley quotes Klosterman on Prussian mining law as saying that the reason for its abolition was that "interminable law suits were inherent in the system." It seems a safe statement to say that the extralateral vein right, introduced in this country as it was first in California, was not adopted directly from the laws of any other country, but was one suggested by the conditions surrounding the prospector.

Origin of the Right

In the year 1849 and the few years following, miners and prospectors came to California, lured by the reports of the Golden West. No mining laws whatever were then in existence in this country. Gradually those miners worked their way into the vast expanse of mountains lying to the east. Mining camps sprung up and the system of adopting mining district rules, governing not only matters pertaining to mining, but also prescribing penalties for offenses, was initiated. There were scores of unprospected hills for each prospector there. It was their belief, and is indeed partly true in portions of California, that the veins were the ideal veins with regular dip and width. With so much unprospected territory before them, it was most natural that the miners should determine that the prospector making discovery of a vein should be permitted to follow the same indefinitely to the depths, without regard to whether it remained within his claim or not. Accordingly the mining district rules embodied that plan, which rules were later largely recognized by acts of the California legislature.

A few years passed by and discoveries were made at Gold Hill and Virginia, now in Storey county, Nevada. In June of the year 1859 the miners of Gold Hill, many of them from the mining districts of California, met to pass and did pass, district rules in which was written, "all quartz claims shall not exceed 300 ft. in length including the dips and spurs." In September of the same year the miners of the Virginia mining district met and adopted rules in which they said, "all quartz claims hereafter located shall be 200 ft. on the lode including all its dips and angles." These district rules had the force of law, were recognized by all, and mining locations were made under them. Less than ten years later, in the year 1866, Congress passed the act recognizing the extralateral vein right, and in 1872 that act was in effect re-enacted with certain changes, most marked of which was that the end-lines were required to be parallel to permit extralateral vein right. It is under that act that the metalliferous mines of the West are now operated. In the light of the fact that prior to the passage of the act, a great many locations had been made under district rules which sanctioned the extralateral vein right, and the further fact that there were such extensive stretches of unprospected mountain ranges, it was most natural that Congress should recognize the system and embody it in the mining laws.

Argument in Favor

The supporters of the extralateral system argue that it is unjust that a prospector should spend his

*From an address delivered at the annual meeting of the Nevada Bar Association.

time and money in prospecting for and finding a vein, only to learn later that by its dip it passes beyond his side-line, at which he must cease working. The argument would apply as well to many other lines of industry. A stratum of placer gravel may be many feet below the surface. It is necessary for the prospector for such stratum to spend his time and money in prospecting and sinking for it, but should he find it, he is limited to his common-law right of vertical planes. One familiar with soils may go upon the public domain and by spending his time and money and applying his learning on the subject, discover that some valley, because of its containing the right percentage of, we will say, decomposed feldspar, or gypsum, is particularly and peculiarly suited to raising a certain valuable plant; but he is not given the right to appropriate all of the land valley that is so suited, although it may be one continuous deposit of that particular soil. Instead, he is limited to his common-law right on his homestead. With almost as much force can it be said that the builder of a great building in a city, by reason of which adjoining property is enhanced in value, should be entitled to the unearned increment on his neighbor's property. The inventor of a machine has his patent right to protect his invention; the writer of a book has his copyright to protect his work. Those are the fruits of the brain of the inventor and the writer, who plainly are entitled to such protection, but can the same be said of the prospector, who, as a rule, makes discovery fortuitously rather than by reason of studied systematic effort? It is possible that the two are in different classes.

Discovery and Location

The extralateral right is given, presumably, as a reward for or prize upon discovery. The laws contemplate, indeed they require, discovery prior to location. The courts have held, however, that if discovery is made prior to entry, it relates back and cures the deficient sequence of discovery subsequent to location. Such is discovery in theory only, for it is known, as a matter of fact, that when a new mining district is reported, miners rush to it, willing to locate claims upon a vein or veins if they chance to find them, but primarily looking for 'free ground' upon which to locate claims. It is safe to say that 90% of the claims located are staked because the locators believe that they are upon unappropriated ground, rather than because they believe that they have made discoveries that justify such locations. It is known further, as a matter of fact, that when a prospector makes a good faith discovery of a vein, he does not rely upon the extralateral vein right that the law gives him and locate a claim or claims along the course or strike of the vein only, but invariably, if the land is unappropriated, he locates claims on either side as 'protection' claims. If that is the practice, as I believe it is, then the person for whom the law was enacted does not rely upon it as giving him the property right he seeks, and its abolition could not be a hardship to him.

Had nature formed veins regular in their strike, width, and dip as they pass from their apices to the depths in the earth, the exatralateral vein right system might be with greater force justified, but they are not regular, as experience has shown, indeed, regularity is the exception rather than the rule. Remaining carefully within the generally accepted theories of vein formation, it may be stated that planes of weakness or fractures in the earth's crust are caused by changes of temperature as in cooling; by relief from pressure, as in case of adjustments of the earth's crust; by movement, as in case of upheaval or faulting; and by many other causes. Mineralizing solutions or gases pass along those planes or fractures. In the case of veins that have been formed by replacement, atom by atom, as is true of many, the wall is replaced by silica or other vein matter, perhaps carrying metals of value, and thus is formed the vein as the miner finds it. Those walls of the fractures are not homogeneous. They are soft here, hard there; soluble here, insoluble there. Mineralizing solutions, where the rock is more soluble, may deposit a great swell or tongue of ore underground, hundreds of feet away from, but connected with, the vein and in the ground of the neighbor of the owner of the apex. A case was tried and decided in the Federal Court of Utah recently, wherein the court held that the owner of the apex was entitled to the bedded orebody or tongue of ore which connected with the vein, although it extended for many feet directly away from the vein. Had erosion subsequent to the deposition of the ore disclosed the tongue of ore at the surface, it is possible that its ownership would have been otherwise resolved.

The Broad Apex

It has been held by the courts that if a vein can be identified, even though thrown a considerable distance by a fault (and it is unusual to find a lode mine wherein the vein has not been thrown, or moved by faults), the owner of the apex may show such identity and follow the vein on its dip. Take as an illustration the Leadville, Colorado, veins. These were so faulted and thrown that the operators, realizing the futility of attempting to apply the law of the apex, very generally settled the disputes thus arising by agreement. The broad apex, in some instances reaching into the hundreds of feet in width, is often split by a common sideline between two claims located respectively by different locators. The courts have settled the law that the first locator under such circumstances takes all of of the vein as it goes to the depths. Usually in such cases it takes much time and a great deal of development to disclose the fact that the broad apex is the apex of one and the same vein. Until that extensive development is done, the junior locator has the deluded impression that he has made a discovery and works on in good faith, only to find that his shaft-house stands as a monument above its buried hopes. Does this square with justice?

A Cause of Litigation

There is no line of litigation in American courts wherein the chances for mistakes and irreparable wrong are as great as in those cases growing out of the law of the apex. Few if any apex suits have

been tried, without witnesses on either side testifying in direct contradiction of those upon the other, and all conscientious and intending to speak the truth as they see it. Repeatedly have the courts in their decisions of such cases referred to the fact that the testimony was conflicting. In the case of Butte Mining Co. *v.* Société Anonyme Des Mines, reported in 58 Pacific at page 111, the court in deciding the case said:

"The evidence was conflicting, many experts for the plaintiff claiming that the apex of the vein from which the ores were extracted was in plaintiff's ground and that it was wholly disconnected with any vein in defendant's ground, while an equal number of expert witnesses called by the defendant testified that in their opinion the apex of the vein was in defendant's ground."

Such in substance has been the expression in many decisions. Witnesses may testify, time passes, and workings are sunk to greater depth, and it may be found that both litigants were wrong; that the ore in dispute and over which they litigated was in a spur from a vein belonging to sill another. Nevertheless, property rights must be determined with the scant conflicting evidence only that can be offered at the time of trial.

Substantial Injustice

As an example of the meagre testimony upon which a jury may reach a verdict and judgment be entered in such cases, glance some time, if you are interested in the question, at a copy of a vertical section used in the case of Collins *v.* Bailey, decided in the Court of Appeals of Colorado in April 1912 and reported, with copy of the section referred to, in 125 Pacific at page 543. The bottom of the shaft from an upper tunnel therein shown is approximately 80 ft. from the surface of the ground, and the dip of a vein disclosed by such shaft is 71°. The vertical distance from the bottom of this upper shaft to the top of a raise in a lower tunnel is 550 ft. There were two undeveloped claims lying between those two workings, and the raise mentioned is 200 ft. southerly from the shaft (projected, of course, in the report) to the plane of section. The dip of a vein shown in the raise from the lower tunnel is 67°. For the purposes of the question, no other veins were disclosed, and the two workings mentioned, if projected, on the same plane, would of course not meet. Yet on this testimony the jury rendered a verdict giving to the owner of the upper shaft the extralateral right through and across the two undeveloped claims and into the lower working spoken of. The lower court denied a new trial and entered judgment accordingly. Fortunately, the Court of Appeals saw the absurdity of it, and reversed on the ground of insufficient evidence to sustain the verdict.

Fact and Theory

As I have said before, the extralateral right is given on the theory that it is a reward to the discoverer of a vein for his diligence in searching for and finding the vein, similar in principle to the protection that is given an inventor. The law, however, as it is actually applied, wanders far afield from that theory. An example of the extent to which it is carried by the courts, and necessarily so in order to be consistently construed, may be found in the case of Ajax Gold Mining Co. *v.* Hilkey, 31 Colorado, page 131. It is therein held that the endline established by the law at the point of departure of the discovery vein across a sideline is not necessarily the endline for the purpose of defining extralateral rights on secondary veins, but that the endlines as located limit such right; in other words, that the discovery vein and a secondary vein, although not apexing in the same segment of the claim, may each carry extralateral rights. The discovery vein, for illustration, may contain $100,000 worth of ore as it goes to the depths; a secondary vein may contain several millions of dollars' worth of ore as it goes downward. The discoverer and locator located the claim in the eyes of the law, because of his discovery on the discovery vein. The law gives him the extralateral right on the secondary veins as well, and the result is that he has discovered a vein containing $100,000, but the law gives him several million in the secondary vein, not discovered by him at all at the time of his location. The fallacy is not in court construction, but in the system that permits a law that is susceptible of such unreasonable application. With almost as much reason, the inventor of a carpet-tack might request a patent right on a linotype machine.

As Others See Us

Others who have given much more thought to this subject than have I, have expressed their opinions upon it. For several years past I have attempted to avail myself of every opportunity to talk with the prospector, he of the pick and pan, to get from him his idea of the so-called apex law. He is one of the persons most vitally interested, and is therefore most entitled to be heard. I have yet to meet a good faith prospector who favors the continuing of the extralateral vein right. Presumably, the law is in existence for his benefit, and if those with whom I have talked express the view of the prospector, he himself desires to be delivered from his friends. As early as 1860, J. Ross Browne, writing semi-humorously, said of the Comstock: "Things are in a great mess of confusion; everybody's spurs are running into everybody else's angles. The Cedar Hill company is spurring the Miller company, the Virginia Lode company is spurring the continuation, the Dow company is spurring the Billy Chollar, and it's a free fight all around." A. Montgomery, a mining engineer who has written on Australian mining laws, in a recent issue of the *Mining and Scientific Press*, in speaking of the extralateral right under the American system, has this to say:

"The extralateral right principle obtaining in portions of the United States is a standing marvel to the rest of the world, and that it could be seriously proposed to perpetuate it outside of cases in which it has already been unfortunately granted, seems incredible to most outside engineers with whom I have come in contact. If all ore deposits could be relied upon to behave themselves in accordance with elementary diagrams in the text-books representing a few of the simple occurrences of fissure veins,

there might be some hope of maintaining the extralateral right system on consistent and logical grounds, but since their forms are in fact protean and not predictable with any real certainty, and since even the best authorities differ, often radically, in their views as to the nature and origin of ore occurrences, there seems no hope of obtaining such precise legal definitions as will serve to justly decide all cases of extralateral right. The claim of the discoverer to follow out his discovery in all its ramifications has a certain amount of apparent justice, but is practically impossible to be granted in very many cases without infringing upon the equal rights of others. If the first man to obtain petroleum by boring, for example, were to have the right to all petroleum that could come to his wells, thus exercising the right of the discoverer to its utmost, he should be protected from the boring operations of his neighbors, whose bores may and probably will tap oil that otherwise would flow to the discoverer's well. Again in coal seams, should the discoverer monopolize the whole seam? If he is not given this right, why should it be given in the case of a lode? Some limit has to be placed on the rights of the discoverer, and it is surely best to follow the same principles as obtain in all other occupancy of land and confine his operations within the boundaries of the land he has located."

Proposals for Change

Horace V. Winchell, in a discussion of mining laws before the Canadian Mining Institute at Toronto in March 1912, refers to the American apex system as "the generally condemned apex law." Reed Smoot, senator for Utah, introduced Senate bill 6194 in April 1912, and in the bill provides for the complete abolition of extralateral rights and gives to the locator of a claim "such veins, lodes, ledges, and deposits of mineral or minerals in place as lie within the block of ground bounded by vertical planes passing through such surface lines," and provides further "that no such locator, his heirs or assigns, shall have the right under such location to follow any vein, lode, ledge, or other deposit outside of the lines of such claim." That bill is now pending before Congress. Samuel C. Adams, First Assistant Secretary of the Interior, in speaking of certain mining legislation that in his judgment should be passed, says: "This legislation would also well supplement Senate bill 6194 (the bill to which I have just referred) now pending before the Senate, which in brief, as to future locations, abolishes extralateral rights." George Otis Smith, Director of the United States Geological Survey, in his annual report for the year ended June 30, 1911, in speaking of the apex law, says: "The law of the apex has proved more productive of expensive litigation than of economical mining. In many of the more recently established and more progressive mining districts this statute has been made inoperative either by common agreement or by compromise between adjoining owners. Its repeal could not affect established equities under patents already granted, but would render possible more certain property rights in large mining districts, not as yet discovered, where new and valuable claims will be located a hundred years from now."

The West and the East

It is said that a Bostonian, traveling in the West, wrote home that the farther West he came the more he was convinced that the three wise men came from the East. Without admitting that our Eastern brother's estimate of us is correct, it nevertheless remains for us who live in the West to determine whether or not the law of the apex is or is not right in principle, and we of this generation should feel the burden that is upon us to determine that question aright, for the mining laws of this country, hardly yet one-half a century old, are but emerging from their infancy, and the metalliferous mining industry in this country doubtless but seeing its sunrise. In the light of present knowledge of vein formation, the interminable litigation growing out of the extralateral system, and the recollection that in some cases violence and bloodshed have resulted from contentions over it, I am convinced that we must change from our present system to that of vertical planes. Such change can, of course, only affect lode-mining claims located subsequent to the amendatory act, but if, as we suspect, a hundred claims will hereafter be located for every one that has been located thus far, those now located which give to their owners a vested property right in veins on the dip are negligible. No one would contend that John Doe should have a property right in Lot 1 in Block 2 while the wind blows south and the aurora borealis adorns the northern heavens. Those phenomena of nature are caused by changes of temperature and resulting reflection from icefields by air pressure and moisture and resulting refraction, and yet we pretend with the law of the apex to define property rights beneath the surface, where the phenomena are much more diverse, and the causes, while in some degree the same, yet vastly more complex, than are those that drive the winds to the south and set aglow the northern lights.

Mineral Output of Japan

The final returns of the mineral production for the second half of 1912 are not available, but the following shows the output of the principal minerals which account for 90% of the total:

	1912.	1911	Change.
Gold, ounces	75,389	69,909	+ 5,480
Silver, ounces	2,547,992	2,251,955	+ 269,037
Copper, pounds	59,042,741	53,743,314	+ 5,299,427
Iron, tons	28,820	29,835	— 1,015
Coal, tons	8,448,493	7,495,205	+ 953,288
Sulphur, tons	21,918	19,438	+ 2,480
Oil, barrels	627,256	675,193	— 47,937

Kauri-gum is an amber-like resin, varying from light cream to brownish yellow in color, is the result of exudation from the tree *agathis australis*, and is recovered by shallow excavations in swamps and districts near kauri forests in New Zealand. It was 'mined' to the extent of 7587 tons, worth $1,723,000, in 1911, the total production to date being 314,087 tons, valued at $75,880,000. This resin is used extensively in varnish making.

Shasta County Smelter-Fume Problems

By J. Nelson Nevius

*The object of this trip was to obtain at first hand for the Chamber of Mines and Oil information on both sides of the controversy between the smelting companies and the agricultural interests in Shasta county, California, and the following report embodies the information given me by the respective parties. I was most courteously received, both at the smelter and by T. W. H. Shanahan, attorney for the Shasta County Farmers' Protective Association, and my questions were answered freely by both parties.

The Kennett Smelter

When operating under normal conditions, the Mammoth Copper Mining Co. operates three blast-furnaces, each having a capacity of approximately 400 tons of charge, or a total of between 1100 and 1200 tons of charge. The ore is massive iron sulphide, containing some copper sulphide, and ranging from 3 to 5% in copper, with some gold and silver. The object of the bag-house system is to eliminate all dust or solid matter from the fume, and also to eliminate entirely the sulphuric acid gas (SO_3) and to reduce the volume of sulphurous acid gas (SO_2) to less than three-quarters of one per cent, in order to comply with the conditions imposed by the court.

By way of explanation it should be said that SO_3 unites readily with atmospheric moisture and forms sulphuric acid. The SO_2, or sulphurous acid, is the pungent odor familiar to all on the burning of a sulphur match and is less active than the SO_3, though capable of damaging vegetation. The solid matter, or dust, is a whitish powder, weighing about 13 lb. to the cubic foot, and has approximately the following chemical composition:

	Per cent.		Per cent.
Copper	1.04	Arsenic	4.3
Insoluble	7.8	Zinc oxide	4.8
Iron	6.2	Zinc sulphate	47.2
Calcium oxide	1.8	Gold, oz.	0.03
Lead	7.0	Silver, oz.	4.08

The total amount of metallic zinc ranges from 20% upward. In this dust the arsenic is the chief objectionable element, but it is also claimed that, by settling on foliage, the dust mechanically retards vegetable growth.

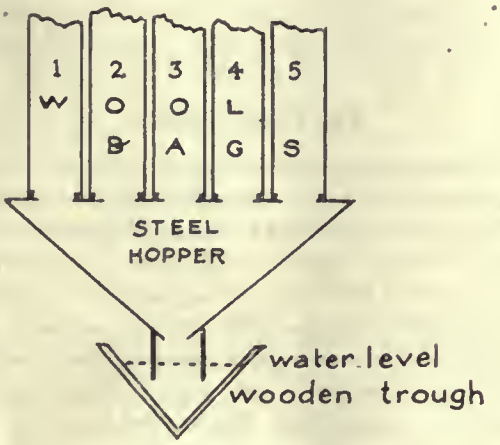
Formerly the fume containing the acids and this dust escaped into the atmosphere and caused damage to vegetation. Under the bag-house system, all the fume from both the blast-furnaces and converters is taken at the base of the former smokestack in four round pipes, 8 ft. in diameter and about 100 ft. long. These convey the fume to a square flue 15 ft. in diameter and about 120 ft. long. The fume is thence conducted to two fans, built by the American Blower Co., each being 11½ ft. in diameter and driven at 300 r.p.m., requiring 400 hp. each. The form of these pipes is merely a matter of convenience and economy, and would be subject to variations at any other plant, as the topography might require. The fans form the suction to draw the fume from the smelter and force it into the 'fan-discharge chamber,' whence it is led into a series of round cooling pipes, 4 ft. in diameter, of which there are 45, arranged in 9 series of 5 pipes each, contained on a rack 180 ft. long. The gas thus travels through 900 ft. of cooling pipes at a rate of 2700 ft. per minute. These pipes discharge the gas into a 'distributing chamber' 15 ft. square and 220 ft. long. The gas is still too hot to go to the bags, so cold air is blown into the top of the 'distributing chamber' through twelve 24-in. pipes leading from a larger supply pipe above, and supplied by a special fan. The temperature of the gas on reaching the distributing chamber is about 130°C., and sufficient cold air is blown in to reduce the temperature to 93°C. The cold air has the further effect of diluting the gas. At the fans the temperature of the gas is 280°C., consequently the loss of temperature in the cooling pipes is 150° Centigrade.

The Bag-House

From the distributing chamber the gas is led to the bag-house through 5 apertures, each of which is under independent control, and leads to one of the 5 bays, or compartments, of the bag-house. The

*From a report made to the Board of Directors of the Los Angeles Chamber of Mines and Oil.

bag-house is 220 ft. long and is divided into 5 bays; there are 4 divisions in each bay, each with a hopper for the removal of the dust. The bags are specially woven of pure wool, 18 inches in diameter and about 34½ ft. long. These are set 21 in. apart, centre to centre, and there are 5 rows of bags to each hopper, making a total of 2960 bags. The bags are suspended vertically from a series of racks, the lower end being fastened in the floor, through which the fume enters, and the closed top tied to a short arm which is a part of an apparatus designed by J. E. Egleston, engineer for the smelter, and operated by electric motors, by which a vertical shaking motion can be given the bags. At fixed



HOPPER UNDER BAGS.

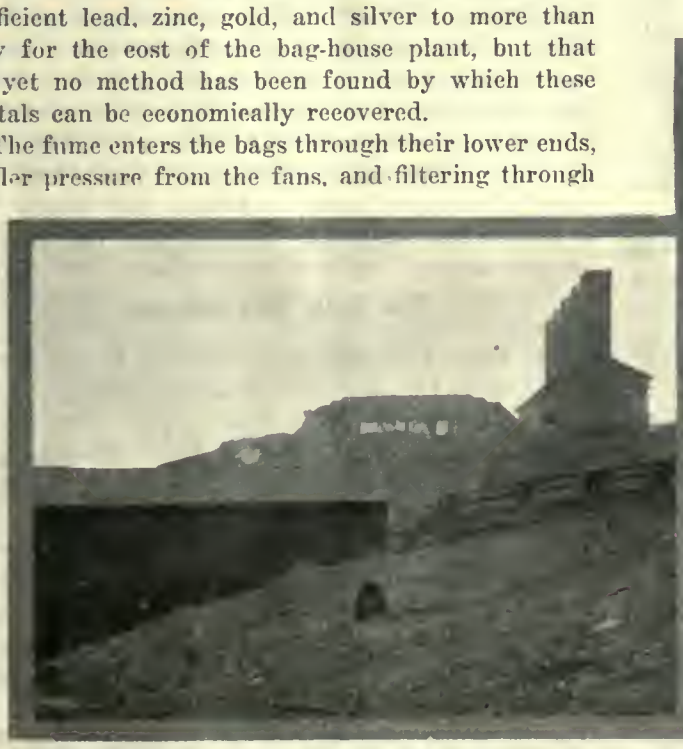
intervals the fume is cut off from the bays, the motor turned on, and the bags shaken vertically, causing the dust to fall into the hoppers below. Originally the dust was removed from the hoppers dry, but the impalpable powder was so distressing to the workmen that a wooden trough was built below the hopper, as shown in the accompanying sketch, so that the dust now falls in water and is drawn off in tanks and settles. It is interesting to note that the dust already accumulated contains sufficient lead, zinc, gold, and silver to more than pay for the cost of the bag-house plant, but that as yet no method has been found by which these metals can be economically recovered.

The fume enters the bags through their lower ends, under pressure from the fans, and filtering through their sides in the closed bag-house, escapes at the roof through 5 large square towers, which distribute the gas to the atmosphere in a much less concentrated form than if it escaped from one flue. The bag-house is open along the sides of the floor and roof to admit free air to dilute the SO_2. The action of the apparatus is as follows: The ore from this mine contains considerable zinc sulphide, which, in the blast-furnaces, is changed to zinc oxide. The zinc oxide has a strong affinity for SO_3, and united with it forms zinc sulphate. In the case of this particular smelter, there is sufficient zinc to completely neutralize the SO_3, but to be certain that none of this gas escapes, hydrated lime is introduced at the fans, at the rate of about 30 lb. per hour, which neutralizes any SO_3 escaping the action of the zinc oxide.

Sampling the Fume

At the distributing chamber a miniature bag about two feet long is operated, from which samples are taken every two hours for purposes of testing for the presence of SO_3. The SO_2 is neutralized simply by the addition of air to the fume, and reduced below the requirements of the court, which, as already stated, is 0.75%. I was informed that the escaping gas varies from 0.4 to 0.6% by volume. The solid matter, or dust, is filtered out by the bags and entirely removed. It is the custom of the company to keep very full and complete records of the results obtained by the entire apparatus, and it claims that the result is as follows: (1) That the escaping gas contains from 0.4 to 0.6% SO_2 by volume; (2) that it contains no SO_3; (3) that it contains no dust.

It is interesting to note that one day's operation showed that the volume of gas passing the fans in 24 hours operation was 333,000 cu. ft. The volume of cold air introduced was 23,000 cu. ft. This was in winter, when the outside air was cold. In summer the volume of outside air introduced may run



SIDE VIEW OF BAG-HOUSE AND SYSTEM OF COOLING PIPES.

LOWER END OF COOLING PIPES.

up as high as 125,000 cu. ft., the reduction in the volume of gas being due to cooling. The volume of gas filtered per minute per square foot of bag surface was 0.631 cu. ft. The amount of dust accumulated in 24 hours varies from 12 to 15 tons, and averages about 13 tons. The gas escaping into the atmosphere carries a little carbonic acid, and an excess of nitrogen, in addition to the sulphurous acid. Tests for the presence of sulphuric acid gas (SO_3) are made every two hours at the miniature bag attached to the distributing chamber. So long as these tests show a deficiency of acidity, it is impossible that SO_3 is escaping. Furthermore, tests have shown that the texture of the bags will show depreciation within a few minutes if any SO_3 comes in contact with them; but the above tests are made and the record kept for the company's protection in case claims may be made of anyone having sampled the outside air and detected traces of SO_3. The bags cost about $6 each, and their life is from 18 months to 2 years.

The Farmers' Side

On December 14 I interviewed T. W. H. Shanahan, attorney for the Shasta County Protection Association, who pointed out that great damage can be done by smelter fumes, without its being apparent at any particular place or time; that is, it may retard the growth of orchards without killing the trees; also, it may retard the development of the size of the fruit, thereby reducing its value; also that damage done is cumulative—a small amount of damage done day after day finally assumes serious proportions; also that the small, almost intangible damage, is very difficult to demonstrate legally. He explained that on being retained by the farmers and looking into the subject in general, he found that the United States Smelting Co., operating at Midvale, Utah, had been closed down by the courts on account of damage done by smelter fumes, and that the company, after making certain agricultural experiments, had petitioned the court to be allowed to operate, provided it eliminated all SO_3 and all dust from the fume, and reduced the SO_2 to less than 0.75% by volume, at the same time so diffusing the gas that it did not damage vegetation. This petition was granted by the court. The United States Smelting, Refining & Mining Co. is the interest controlling the Mammoth smelter, and Mr. Shanahan secured an order from the court that Shasta county smelters must either equip themselves to fulfill the following conditions, or shut down, being given a certain length of time in which to obey its mandate, which provided as follows:

1. That all free sulphuric acid shall be removed from the fume, by the application of zinc oxide or some other neutralizing agent, before reaching the bag-house.

2. That all solid matter shall be removed by the bags in the bag-house.

3. That after the neutralization of the free sulphuric acid, and the removal of all solid matter, that not to exceed 0.75% of sulphur dioxide (invisible gas) in volume, shall be permitted to escape into the atmosphere.

4. That only the amount of sulphur dioxide be permitted to escape into the atmosphere, as not to damage complainants; or complainants' crops, trees, or vegetation; or do any injury to their live-stock; and so as not to cause any discomforts or inconveniences to the complainants or any members of the families of any of the complainants.

Thus it is apparent that unless the Shasta county smelters operate in conformity with the court's decree, they are immediately in contempt of court, and it is not necessary for the farmers to prove any actual damage done, it being necessary for them to demonstrate that the court's order is not being obeyed in order to close any smelter. The Mammoth Copper Mining Co. protected itself by constructing the bag-house at a cost of about $250,000, and the company states that it is now operating within the law.

The Coram Smelter

The Balaklala Consolidated Copper Co., owning the smelter at Coram, Shasta county, installed the Cottrell process at a cost of about $126,000 for equipment, and some $25,000 additional for experimenting. After it had been in operation a while, the farmers still complained, though the company maintained that it was complying substantially with the conditions imposed by the court. Thereupon, Mr. Shanahan engaged the services of Gould & Burt, consulting chemists, to test the fume. They made 44 tests, and found that in 8 out of the 44 the percentage of SO_2 was in excess of 0.75% allowed by the court; that free SO_3 was escaping, as was shown in several of the tests, and also that dust was escaping. The tests showed that the maximum amount of SO_2 found in any one test was 0.921%, and their summary showed that the efficiency of the Cottrell process was as follows: Maximum, 96% plus; average, 74%; minimum, 20%; and they concluded that the process was worthless for the purpose intended. Mr. Shanahan stated that the company did not dispute the accuracy of these tests; consequently that the company was disobeying the injunction on three counts, and was, therefore, in contempt of court. The result was that the company compromised by paying the Farmers' Protective Association $4000, which was about the costs of chemists and legal fees, and closed the smelter. The Balaklala was smelting 700 tons of ore per day.

The Bully Hill Smelter

The Bully Hill smelter is situated 17 miles east of the other two, and is surrounded chiefly by Government land and forest reserve. The capacity of the plant is in the neighborhood of 400 tons per day. Mr. Shanahan stated that when the Government saw the success of his efforts, it enjoined the Bully Hill smelter and gave that company a short time in which to equip a fume destroyer, or close down. This was in 1910, at which time the price of copper was low, and apparently the company closed down rather than go to the expense of questionable experiments. At the present time the Bully Hill smelter is closed, and no one seems to know the plans of the company.

Present Conditions

The Balaklala smelter has been closed and partly dismantled, and the Mammoth smelter is the only one operating. Mr. Shanahan stated that a marked improvement in conditions is apparent since the Mammoth smelter installed the bag-house, and since the other smelters closed. He was not prepared to state whether, in his opinion, the bag-house was entirely successful, or whether there might not be further disputes with the farmers; but he expressed the belief that it was by far the best scheme yet devised, and that he sincerely hoped it would be effective. He stated also that, while most of the farmers appeared to be satisfied with present conditions, some of them were still complaining, but that during the past season the French prune crop in the vicinity of Anderson was the best it has been in years. At the annual meeting of the Shasta County Farmers' Protective Association, held in Anderson December 13, the new officers elected were from the dissatisfied element, and that at least some of the farmers are still dissatisfied appears to be shown in the newspaper accounts of that meeting as appended to this report. Mr. Shanahan protested at the smelters being permitted to experiment with new processes, because of the fact that damage was being done meanwhile, but he was not prepared to state how a successful process could be developed other than by actual experiment. He freely acknowledged that this was the only way the question could be determined, and his only suggestion was that such experiments be conducted on the desert.

Fundamental Conditions

There appear to be two fundamental reasons why the smelter situation in Shasta county imposes peculiar difficulties: (1) the ore is a massive sulphide, in other words the sulphur content is unusually high, which produces an unusual amount of sulphur gases; (2) the two principal smelters were within three miles of each other, and in a narrow valley in which the winds are almost invariably either north or south, consequently the fume was more concentrated than if the region were subjected to varying winds. The natural conclusion seems to be that the smelters should not be congregated near an agricultural region for the reason that while one smelter may operate within the law and without injury to the agricultural interests, it does not follow that more than one smelter, even though they operate within the law, will not have a damaging effect. As a test of present conditions at Kennett, it is interesting to note the lawns, shrubs, and flower gardens surrounding the houses, within half a mile of the smelter. I was informed that it has been possible to maintain those gardens only since the bag-house was built.

Explosives investigations by the Bureau of Mines involved 5727 tests last year, while in the electrical work of the Bureau 2062 tests and 23,611 observations were made.

Miners employed at metalliferous mines in New Zealand totaled 7400, and at coal mines 4290, in 1911.

Progress at the Panama Canal

Of the total of 2,043,730 cu. yd. of concrete to be laid for the three twin locks at Gatun, there had been finished 1,929,306 cu. yd. on January 18. At the Pedro Miguel lock 905,625 cu. yd. has been placed, this being almost completed, while at the Miraflores locks 1,410,541 cu. yd. out of 1,499,800 cu. yd. has been laid. In this concrete work the 2, 1, and ½-cu. yd. mixers have averaged, of late, about 40, 11, and 8 cu. yd. per hour in operation. The Gatun dam is 96% completed, and on January 1 there were 21,068,080 cu. yd. deposited, including 10,124,082 cu. yd. of hydraulic, and 10,943,998 cu. yd. of dry fill. Out of 225,000 cu. yd. for the Gatun dam spillway, 214,218 cu. yd. has been laid. The Ancon rock-crusher plant averaged 290 tons per hour while in operation. Up to January 1, 1913, 100,887,019 cu. yd. had been removed from the Central division, which includes the Culebra cut and Chagres section, leaving 5,239,202 cu. yd. to be excavated.

Population and Commerce

The population of Colon is 20,232, and Panama 47,172, and of the Canal Zone 62,810 persons. Actual working force at the end of December was 39,499 men, and the death rate was 10.42 per 1000, there being one death from malaria fever, and none from yellow fever, smallpox, or plague. Consumption of water at Colon is 1,368,953, and Panama 1,752,419 gal. per day.

Commerce between the Atlantic and Pacific coasts of the United States by way of the isthmuses of Panama and Tehuantepec aggregated approximately $125,000,000 in 1912. The rapid growth of the traffic between the eastern and western coasts of the United States via the isthmuses which developed chiefly within very recent years and seems likely to further increase with the opening of the Panama canal, led the Statistical Division of the Bureau of Foreign and Domestic Commerce to establish, at the beginning of the present fiscal year, a monthly record of the movements of the principal articles forming this traffic. Its record for the 5 months ending with November has just been published and shows $24,500,000 worth of merchandise passing from the Atlantic coast to the Pacific coast via the Tehuantepec railroad, and $5,000,000 worth via the Panama railroad; while the value of that passing from the Pacific coast to the Atlantic was, via the Tehuantepec line, $14,330,000, and via the Panama line $3,750,000. This suggests that the total value of the traffic for the half-year ended December was approximately $30,000,000 westbound across the Tehuantepec route and $6,000,000 via the Panama line; and of eastbound coming from the Pacific Coast ports and Hawaii $16,000,000 via Tehuantepec and $4,500,000 via Panama; and that the total value of this traffic for the full year approximates $125,000,000. The Panama railroad ditching machine, equipped with a ¾-yd. dipper, loaded 1058 cu. yd. of gravel at the Matachin gravel pit on February 4. This record is comparable with that of some steam-shovels. The engineer was E. Richard.

Wisconsin-Illinois Zinc Mines in 1912

By P. K. Kelley

When the Wisconsin-Illinois zinc district increased its ore production in 1911 by 20% over 1910, the magnitude of the growth seemed extraordinary. The final production figures for the year just ended, however, are all the more surprising, in that they show an increase of 33% over 1911. The shipments to smelters, denoted in short tons, are as follows: 100,000 in 1912, 75,000 in 1911, 63,000 in 1910. The table below shows ore shipments from individual camps in 1911 and 1912. The figures are given in short tons and do not include shipments from separating plants to smelters.

	1911.	1912.
Highland	4,457	4,148
Linden	8,174	7,469
Harker	4,173	6,012
Mineral Point	1,173	725
Montfort	1,790	1,148
Livingston	6,483	9,526
Rewey	2,851	1,300
Platteville	14,684	14,185
Cuba City	2,201	3,960
Benton	25,406	24,143
Hazel Green	20,121	17,414
Shullsburg	4,705	12,684
Galena	10,766	15,784
Dodgeville	200	776
Totals	107,194	119,274
	1911.	1912.
Total shipments of lead, lb.	9,002,025	7,896,930
Total shipments of pyrite, lb.	28,679,030	38,660,830

While these figures show a decrease of 500 tons of lead ore, there was an increase of 12,080 tons of zinc and 2990 of pyrite. An expansion as large as this should have other causes than those due to natural growth alone. The strength of the market was the paramount cause, but better railway transportation helped. That the metal content of the ores in this region is not decreasing is evidenced by the fact that the average assay of all ores for 1912 is 36.67% Zn against 34.68% Zn for 1911.

Old Mines Reopened

The year 1912 has been marked by the reopening of many old mines. Among the most important now entering or about to enter the producing list are the Schrier, Brown-Croft, Baxter, Trego, Scrabble Creek, Field, Hodge, Reich, Raisbeck, Grant County, Beloit-Merger, Federal, Black Jack, and Lucky Hit. There have also been new concentrating plants or sinking equipments erected at the East End, Hird, Gruno, Masbruch, Lawrenee, Rundell, Frontier, Winskill, Klar-Piquett, Wallace, Tripoli, and Grotkin. In addition to the foregoing mining properties, there was quite an impetus given to the building of roasting and separating plants during the year. The Joplin Separating Co., at Galena, completed the rebuilding of its plant, with an accompanying increase of capacity. The National Zinc Separating Co. erected a 60-ton plant near Cuba City. A Campbell process separator is in course of construction at the Optimo mine near Linden.

Prices were high, ore prices following closely the spelter market. At the outset, producers were receiving $44 as a base for 60% ore. There was a steady march from that point until August, when there was a slight falling off in the high price. The ore market continued strong, however, through September and October, and the highest price ever received for a car of ore was recorded during that period—$64 per ton was paid for a car of ore on a basis of $63 for 60% zinc. The last two months of the year gave the producers a steady strong market which ranged around $56 to $57 per ton.

NATIONAL SEPARATING PLANT.

In addition to the better facilities given to the mines during the year by the existing railroads, there is a movement on foot for the building of a new steam railway through the districts. It is planned to furnish closer rail connection between the mining districts, the Illinois coalfields, and the smelters. The Mineral Point Public Service Co. is extending its high-tension line to many properties in the northern part of the community. This fact, added to the continual extension of the power-lines of the Inter-State Light & Power Co. of Galena, Illinois, assures the operators of elastic and adequate power service.

Cost of Handling Ore

The annual report of the Premier Diamond Co., Transvaal, gives a chance for comparison of costs of mining and handling material, all published quantities being reduced to short tons. The figures from the copper mines are not strictly comparable because they include smelting as well as mining. Steam-shovel costs alone of the Nevada Consolidated are 68c. per ton and of the Utah Copper Co. 33.73 cents.

	Tons.	Per ton.
Mesabi iron-ore mines	[1]33,600,000	$0.70
Nevada Consolidated mine	[2]3,338,242	2.30
Panama canal	[3]5,748,510	0.40
Premier diamond mine	[4]7,765,600	0.72
Utah Copper mine	[5]4,680,801	1.77

[1]Mainly steam-shovel mining, including drilling and blasting, to loading on cars.

[2]Steam-shovel mining, 3,249,140 cu. yd. of capping removed, and 3,338,242 tons of ore treated by concentration and smelting of concentrate.

[3]Steam-shovel work, including from clearing and blasting to administration.

[4]Native labor employed, 11,000, with 170 overseers. Hand-drilling, rope haulage, crushing, jigging, and concentration on grease tables.

[5]Steam-shovel mining mostly; 5,450,604 cu. yd. of capping removed, and 4,680,801 tons of ore treated by concentration, and smelting concentrate.

Valuation of Mines by the Public

By Heath Steele

Judging from market quotations on mining stocks, the public either does not care about the real investment value of a mining security or else is wholly lacking in knowledge of the fundamentals of mine valuation. No one should expect the average buyer of mining stocks to be an expert at appraisal, but there is such a great difference displayed in the ability to appraise mining and industrial stocks that one cannot help wondering if the gambling element does not trade more in these stocks than in the other forms of securities. Some time ago I had occasion to look up the interest returns on mining and railroad stocks based on the average market quotations, and was surprised to find the public was buying both stocks on about the same basis. To anyone who understands mining, this is ridiculous, as a railroad is at least supposed to maintain its assets, if not actually increase them, while a mine is naturally worth more at the beginning of dividends and depreciates thereafter rapidly in value. So much has been published in the technical and financial press of late on the valuation of mines that it is reasonable to suppose the public is more enlightened on the subject. I am inclined to think this is true, as the recent high prices do not show the overvaluations of 1906 and 1907, but there is still a lot of educational work to be done along this line.

The table given herewith shows the high and low records of 40 copper stocks for a 12-year period, 1901 to 1912. Of these mines, 20 have paid dividends and 20 are non-dividend payers.

A Record of Prices

It will be noticed that practically all the high records were made about 1907, when the price of copper was high. The non-dividend payers serve to show how the hopes and expectations of the public rise and fall, and the enormous prices paid for prospects. For example, basing the calculation on the present outstanding stock, this group of mines was given a market valuation by the high quotations, of $125,392,000; but when optimism gave way to pessimism, as recorded by the lowest quotations, the public's opinion of these mines depreciated $114,439,000 and the appraisal was only $10,953,000 for the group. Some may say this occurred over a long period in which many things happened; that some of these properties looked promising enough at one time or another to warrant a high valuation. But can there be any sound reason for the public's hopes fluctuating 90% in 1912? The record shows the low 1912 valuation of these non-dividend payers to have been $29,423,000 and the high selling prices to have added $26,430,000 to this amount, giving a total valuation of $55,853,000 to the same mines. It is not the valuation of $125,000,000 that staggers one so much as what the public expected of these properties when it placed that valuation upon them. For if a 15-cent average price for copper, and an 11.5c. cost be allowed, which is a very fair cost for these properties, and only a 6% average annual dividend be asked, it would mean that each should produce about 10,700,000 lb. of copper per year for 41 years, or a total of almost 9,000,000,000 lb., figuring interest at 5% on the investment. This would mean practically another Lake Superior district. If these mines be appraised at the average between the high and low quotations of 1912, the valuation would mean the successful development of about five mines out of this group. If the low cost of 9.5c. per pound on 15c. copper be allowed, it would mean a total production of about 400,000,000 lb. each in 41 years, figuring on a 6% annual dividend. The production of the Quincy mine, which has paid dividends for over 41 years, has been about 500,000,000 pounds.

Dividend Paying Mines

Studies of the dividend payers yield figures that give good evidence of the public's erratic appraisals. The high quotations yield a valuation of about $1,063,000,000 placed on these mines, or 366% over the low quotations, which give a valuation of $228,306,000. In 1912 the public appraised these same mines from $465,747,000 to $659,359,000, a difference of 41.4% over the low valuations. These mines have paid approximately $217,000,000 in dividends during this period, or an average of about $18,100,000 per year. If the valuation of $1,063,000,000 placed upon this group be taken, the result figures to 1.71% income. The average annual dividend for the last six years has been $23,367,000, or 2.2% income; on the basis of 1912 dividends, $34,322,000, the return would be 3.2%. This is all that is necessary to say for this valuation. Based on the lowest valuation, $228,000,000, the average rate of income for the 12-year period has been 7.95%, and for the past 6 years 10.1%. On the basis of 7.95% income, with interest at 5%, would mean an expected life of about 21 years for these mines, and on a 10% income a 15-year life. The high valuation of 1912 with an annual dividend of $18,100,000 would give an income of 2.75%; on the 6-year average of $23,367,000 the income would be 3.5%, and at the 1912 dividend-rate, 5.2%. This means that these mines would practically have to last forever and pay at the rate of 1912 dividends, which is about 17% higher than previous years, if bought at the high valuation on a 5% interest basis. On the low 1912 valuation, $465,747,000, the rate of interest return on the 12-year average dvidend is about 3.9%, on the 6-year average dividend 5.05%, and at the 1912 rate about 7.46 per cent.

Mines Overvalued

As the majority of these stocks must have been traded at prices between the high and low average of the two 1912 valuations, $562,000,000 may be taken as indicating the real valuation placed upon these mines by the public. On this the interest return would be 4.15 and 6.12% respectively for the 6-year average and the 1912 dividends. If dividends will equal the 1912 rate for about 40 years, this valuation will be justified. It is evident from these facts that mines as a whole are consistently overvalued by the market quotations. However, one ean very often point to undervaluations in the case of single mines, particularly those operating along sound business lines—not agitating with printer's ink and concentrating (the public's attention) with printing presses.

High-Level Dredging

At Waikaia, in Otago, New Zealand, aecording to the annual report of the Department of Mines, the Mystery Flat Gold Dredging Co. is engaged upon operations which constitute a departure from ordinary gold-dredging practice. After dredging all the available river-flat, this dredge is now working its way up the gentle slopes of the surrounding foothills and terraees. To do this, water has been brought to the claim by a ditch 2½ miles long, and at an elevation of 50 ft. above the river-level. The dredge floats in a pond supplied by this ditch, and continually stacks its tailing behind, forming a dam to maintain the level of the water. As the ground is shallow, a tailing-elevator is not required, the material being passed through a sluice-box. When first attaeking the slopes it was found that the tailing embankment eould not be raised with the ascent of the ground until a low dam had been built to hold the bulk of the tailing. Once started in this manner, the tailing keeps building an efficient embankment for the pond. At present the dredge is about 30 ft. above the river level, and it is proposed to work up to the ditch. After reaching that level, pumping will be necessary to keep the pond full, for the proposed scheme is, if possible, to work over a low ridge at an elevation of about 50 ft. above the level of the ditch, and so into another gulch, down which the dredge will work its way to the river again. From the progress already made it would appear that this method of working is quite feasible, and though in this case it is intended to rise only about 100 ft., there is no reason why this method should not be applied to even greater heights, and so render available ground hitherto considered unworkable owing to the laek of high-pressure water for sluicing.

Operating Costs at the Kalgurli Mine

The last annual report of this company gives the following details of mining and costs per ton, there being 123,800 tons treated during the year by ball-milling in Krupp mills, roasting in Edwards furnaces, classification, grinding in pans, agitation by air (Kalgurli system, introduced in 1901), filter-pressing, and disposal of residue by sluieing.

Proposed Regulation of Gold-Dredging

By Charles Janin

The regulation or restriction of areas otherwise suitable for gold-dredging is the object of a bill recently introduced in the California legislature which is creating serious concern among dredging men. Briefly stated, the bill declares the cultivation of the soil to be necessary for future subsistence, livelihood, and prosperity of the people, while the use of the ground for gold-dredging is more especially for the benefit of the present only. It provides that anyone intending to mine soil for gold or other precious metal, by dredging, must make written application to the State Water Commission for a permit before commencement of work. The Commission is to examine into the merits of the case and to hand down a decision within 90 days after application. The Commission is not limited to a consideration of the value of the annual production of the soil, but may take into account the benefits to be derived from its future use for agricultural purposes. The advocates of the bill thus contend that the fundamental and most valuable use of all ground is for agricultural purposes. This bill will impose onerous conditions upon the dredge operators, who must appear before the board and justify the continuance of their present operations, and it jeopardizes the existence of companies representing an investment of approximately $10,000,000 in machinery and equipment and considerably in excess of that amount in land and other holdings.

History of Dredging

It is not necessary to narrate in detail the history of gold-dredging in this state, but the following table shows the production of gold won from dredging operations, by years, from 1898, when it was $18,878, to 1912, when it was in excess of $7,500,000. The total to date is nearly $50,000,000. This amount has been added to the wealth of the state by means of gold-dredging.

Production by Dredges of Gold in California, 1898 to 1910

Year.	Amount.	Year.	Amount.
1898	$ 18,847	1906	$5,098,354
1899	133,812	1907	5,065,437
1900	200,369	1908	6,536,089
1901	471,934	1909	7,382,950
1902	801,295	1910	7,550,254
1903	1,488,556	1911	7,666,401
1904	2,187,038	1912*	7,500,000
1905	3,276,141		

*Estimated.

These figures show that gold-dredging is one of the most important industries in California. During 1912 there were 65 dredges operating in the state. The dredging and associated companies employ approximately 2500 men; the yearly wages are in excess of $2,500,000.

The proposed bill is not the first attempt to curtail gold-dredging in California. At times in recent years there have been complaints about the tailing from the dredges obstructing the rivers and discoloring the streams. In several instances these complaints came from men who had but a short time before sold their agriculturally worthless land at a substantial price to the very dredging companies to whose operations they were then objecting. The dredge men have for years been impounding the overflow from the dredge ponds, and have spent considerable money in preventing this water from flowing into rivers. Most of the dredges now operating in California, with the exception of those in the Yuba river, are working inland and not in the river beds proper. They are not, therefore, obstructing the rivers with their tailing or causing overflow during flood-times with resultant damage to adjoining land. A committee appointed by an anti-dredge convention, a couple of years ago, reported that the dredges along the Yuba and American rivers, instead of sending down débris, were impounding considerable sand and keeping it from going into the streams.

The present bill proposes a limitation of the industry to a greater degree than any based upon damage due to pollution of streams. It is based upon another assumption entirely, and prohibits the dredging of the land in the first instance if it is land that can be used for agricultural purposes. The contentions of the dredge operators merit most careful consideration, and no hasty action should be taken in the matter. When problems like this are intelligently and honestly studied, it will be found that the amount of damage done by the dredge is not large and is more than compensated for by the good resulting from the industry: one which adds millions of dollars worth of gold annually to the state's products and distributes immense sums through the various channels of trade.

Area of Land Affected

The amount of land attacked by the bill is not great. Compared to the total area of arable lands in the state, it seems almost infinitesimal. At the present time there are approximately 12,000 acres of land thought to be suitable for dredging in the state, and only about 3500 acres of this could be classified as agricultural. According to figures of the California Development Board, there are 28,000,000 acres of arable land in the state, and assuming 3500 acres as the area of such land planned to be dredged, it will be seen that this represents but 1/80 of 1% of the total area of arable land. The distribution of this agricultural land is approximately as follows: Butte county, 632 acres; Yuba, 792; Sacramento, 1372; Placer, 530 (not entirely proved to be dredging land); Trinity, 80; Stanislaus, 150; total, 3556. Nearly one-half of the agricultural land to be dredged is owned by one company, the Natomas Consolidated of California. This concern has, according to the management, over $3,000,000 invested in dredges, shops, and plant, aside from the investment in land. It employs nearly 400 men in

the operation and maintenance of its dredges, and produces about $2,000,000 yearly. The company in its different operations employs a total of 1500 men and has a yearly payroll of about $1,200,000.

No Agitation Elsewhere

This agitation over the loss of land by mining seems to be confined in the United States to California. So far as I have heard, no objection has ever been raised to the operations of stripping soil from land in advance of mining operations for coal in Kansas, phosphate in Tennessee, iron in Minnesota, or iron in the north of England. While the land stripped in Minnesota has not been used for agricultural purposes, similar land is so used. In Tennessee a considerable acreage of first-class agricultural land was destroyed in mining phosphate deposits, and in Kansas good land has been destroyed in stripping for coal. Destruction of land for mining should rest on the same basis as its use for other purposes, such as building permanent structures, roads, and railroads. When it is proposed to conserve only 1/80 of 1% of all the state by restricting dredging, it may be pointed out that there are other places where conservation of land of far greater area can be accomplished without jeopardizing any great established industry. For instance, there are approximately 50,000 miles of highway in the state, and 27,000 miles of steam and electric railways, not counting those in cities and towns. A strip one foot wide taken off the right-of-way of these areas would conserve considerable more land than all the arable land affected by this anti-dredging bill. There can be no question but that land is wasted in rights-of-way, and much land is rendered permanently unsuitable for agriculture by other industries than dredging. It is an incident to industry, and if greater wealth is thereby created, there is a net gain.

Extent of Known Fields

The major portion of the dredging ground of California lies in three fields. At Oroville, Butte county; near Marysville, Yuba county; and near Folsom in Sacramento county. The limits of dredging ground in these three fields have been definitely determined. The Oroville field was the first to be developed, has proved to be the greatest in extent, and is rapidly being exhausted. In about three years most of the dredges now operating will be out of commission, and several of the companies will finish their ground in less time. In the Yuba field there are two companies operating, the Yuba Consolidated with 12 dredges, and the Marysville Dredging Co. with two. The ground is deep and it will take a number of years to work out the district. There is comparatively little good agricultural land in these holdings, and there is little or no possibility of increasing the acreage of ground to be dredged. The American field, with the exception of the Union Dredging Co.'s holdings and a few acres belonging to the Ashburton Mining Co., is controlled by the Natomas Consolidated. In addition to the 500 acres at Oroville, there are about 3500 acres belonging to the company at Natoma that is considered dredging land, and in addition to this there are about 1000 acres in river beds and old hydraulic pits which is not considered of much value, but some of which may ultimately be dredged to finish the life of the old machines. There are 33 companies in the state operating 65 dredges, but there are only 4 companies operating more than 2 dredges.

It may be of interest to note that wherever dredge mining is carried on the nearby ranches and towns have been greatly benefited. Today great activity and prosperity exist at Oroville, Marysville, Hammonton, Marigold, Folsom, Jenny Lind, and other places which were almost dormant or did not exist previous to the advent of the dredging companies. One of the greatest benefits derived from dredging operations in the state, and one which should appeal to even the most bitter antagonist of the dredging industry, is the work of the Natomas Consolidated in building extensive and expensive levees in reclaiming 60,000 acres in the Sacramento valley. This reclamation project is bringing into use approximately 40 times the number of acres of arable land that the company expects to dredge for gold. The work of reclamation will cost in excess of $5,000,000 and the money which is used to reclaim this land comes from gold-dredging. Operations such as this are of the greatest permanent benefit to the state. The loss of any small area that might have been useful for agricultural purposes is compensated for 50 times or even 100 times over by bringing into production 60,000 acres that, when fully reclaimed, will, if the company's expectations are realized, add to the wealth of the state from $20,000,000 to $25,000,000. It must also be considered that most of this land was idle and practically worthless before this work of reclamation was begun, and that it would probably have been idle for a number of years to come except for the work of the Natomas Consolidated, made possible from the profits resulting from gold-dredging.

Reclaiming Dredged Land

The advocates of the bill contend that after land has been dredged following the present method of operation in California, it is practically worthless for any economic purpose. The successful reclamation of trial areas at Natoma and Oroville, where ground that has been dredged has been planted to fruit trees, grape vines, olive and eucalyptus trees, would tend to prove the contrary.

Rock-crushing, which utilizes the coarser portions of the dredge tailing, has also become an important industry of much benefit to the state. It gives work to many men and supplies crushed rock at a cost estimated to average about 30% less than that previous to the operation of these plants. Some idea of the magnitude and the gross value of the output may be gathered from the following figures. The rock-crushing plants of the Natomas Consolidated, with improvements contemplated, will have a capacity sufficient for clearing the tailing from about 60 acres of dredged land per year. The lands are so situated as to draw most of their supply from land suitable for agricultural use after the coarser rocks are removed. In about 25 years, therefore, according to these figures, the plants can clear as many acres as the Natomas Consolidated has yet to dredge

of agricultural lands. The company estimates the product from one acre of dredged land is about 40,000 tons of marketable crushed rock and gravel. The value of this material at the plant is about $13,000. The freight charges average at least $12,000. which is wealth created and put into circulation through labor, freight, and sundry charges. Lest these figures be interpreted as showing a large profit on the operation of rock-crushing plants, it may be mentioned that the net income to the Natomas Consolidated from the rock-crushing operations is stated to be about 5% on the investment entailed; something over $1,000,000.

Comparisons of Value

For comparative purposes the following figures may be of interest: Assuming that there are 12,000 acres of land yet to be dredged in the state, and that the average depth of this land is 11 yd., there would then be an average of 53,240 cu. yd., which may be taken as 50,000 cu. yd. of material to the acre. The average operating cost of dredging in the state may be taken at 5c. per cubic yard, or $2500 per acre. In 12,000 acres there would be distributed $30,000,000 in labor and other operating costs. The average gross value of this material may be taken at 10c. per yard. Accordingly, $60,000,000 will be added to the production of the state, the greater part of which is spent within its borders.

Land that was formerly planted in vineyards and handled as such at a loss has been dredged at a profit to the owner and to the state. In one area of several hundred acres the gross amount realized from grapes averaged, over a period of several years under careful cultivation and attention, about $25.40 per acre per year. The greatest gross production per acre from this land when planted to vineyard was $32.50 per year. The net result from these operations was less than $10 per acre for any one year, and some years the property was operated at a loss. Such of this land as had been dredged has averaged $2930 per acre. If it is assumed that this amount was placed at interest, the yearly return from such investment would be about $150 per year. While these figures cannot be applied to all vineyards, in the case in point the gold produced from dredging may be regarded as added to the permanent wealth of the state while the crops from the vineyard can hardly be regarded in any such light.

New Zealand Practice

It is held by some who are possessed of incomplete knowledge of the operation of a gold-dredge, that, by the use of dredges of a different type than those now employed in the California field, the tailing can be more evenly distributed and the ground destroyed at the front end of the dredge may be reclaimed as the tailing is deposited at the stern. The dredge would thus have the effect of deep plowing and aerating the soil. These ideas are based upon accounts of the operation of the small dredges in Victoria and New Zealand where re-soiling operations have been employed for several years. Some dredges of the design first used in California left the ground behind the dredge in a condition more pleasing to the eye than the 'unsightly piles of gravel' that follow the modern dredge. It is also contended and believed that the tailing from the old type dredge left the ground in a better condition for reclaiming than the tailing from the modern boat. There is, however, some question about this, as there were great quantities of boulders and coarse gravel on the top of the tailing, and in this state none of the land handled by these dredges has ever been replanted.

Shallow Versus Deep Ground

It is true that Victorian and New Zealand dredges operating under the present restrictions in those countries do leave the land in better shape for reclamation than the California boats. This is due to the resoiling or sluicing arrangements that have of necessity been added to those machines. While these arrangements have given a degree of satisfaction in the countries named, it must be considered that the different character of the dredging ground in California would prevent the economic use of such arrangements except in a very few places. The modern California dredge has been developed following the studies and experiments of operators for a number of years, and it would be impracticable if not impossible to handle the deep ground being worked without the tailing stacker as now used. The operations of the dredges in Victoria or New Zealand are confined to shallow ground; those in California, in places are dredging ground 70 ft. deep. At some places there is a bank 20 or 25 ft. high in front of the boat. It is obvious, or should be, that in digging ground of this depth, with a high bank in front of the dredge, it would be practically impossible to dispose of the tailing without the high stacking arrangement in the rear of the boat. Experienced operators contend that it is not feasible to level the tailing from this deep ground while operating. To do so and deposit the fine soil on top of the leveled coarse tailing would add such a cost to the operation of the boat that few dredges handling deep ground having a low gold content would continue in operation. For instance, the records taken from the operations of three large dredges for the year ending 1912 show a net recovery over bare operating costs of 3.25c., 1.38c., and 3.7c. per cubic yard, respectively. These figures make no allowance for depreciation of plant or amortization of capital, and it is obvious that had any additional charges incidental to leveling and reclaiming the land been necessary, the operations would have resulted in loss.

The flume type of dredge, which distributes the tailing fairly evenly behind the dredge, has a long sluice or flume paved with riffles by which the gold is saved. Experience has demonstrated that while these arrangements permit saving a considerable portion of the gold content of material from ground which is free from much clay and which contains coarse gold, the percentage of recovery is small when dredging ground where the gold is light and flaky. One of the steps in the development of the modern dredge has been the gradual and constant increase of the area of the gold-saving tables and the even distribution of the material being washed. This has been made necessary by the dredging of ground of lower gold content and on account of the character

of the gold to be saved. If this material was carried with the heavy rush of water that runs through the sluices of the flume dredge, a large percentage of the gold content would be lost.

Double-Lift Dredges Unprofitable

The old Continental dredge, which was one of the first successful boats operated in California, was first designed as a double-lift machine; that is, the fine material from the buckets was passed to sump or water-tight compartment built in the hull of the dredge, the coarse material being dumped over the side of the boat. The fine material was raised by

EUCALYPTUS TREES GROWN ON DREDE TAILING.

means of a suction pump to a straight sluice supported by an auxiliary scow extending about 70 ft. behind the dredge. While these operations left the tailing more evenly distributed than the modern boats, the dredge operated at a loss until it was changed to one of the present type. Among the principal changes made was the change of the gold-saving devices from straight sluices to riffle table areas, to enable clean washing and even distribution of the material and the recovery of fine gold that it was impossible to save with the former arrangements.

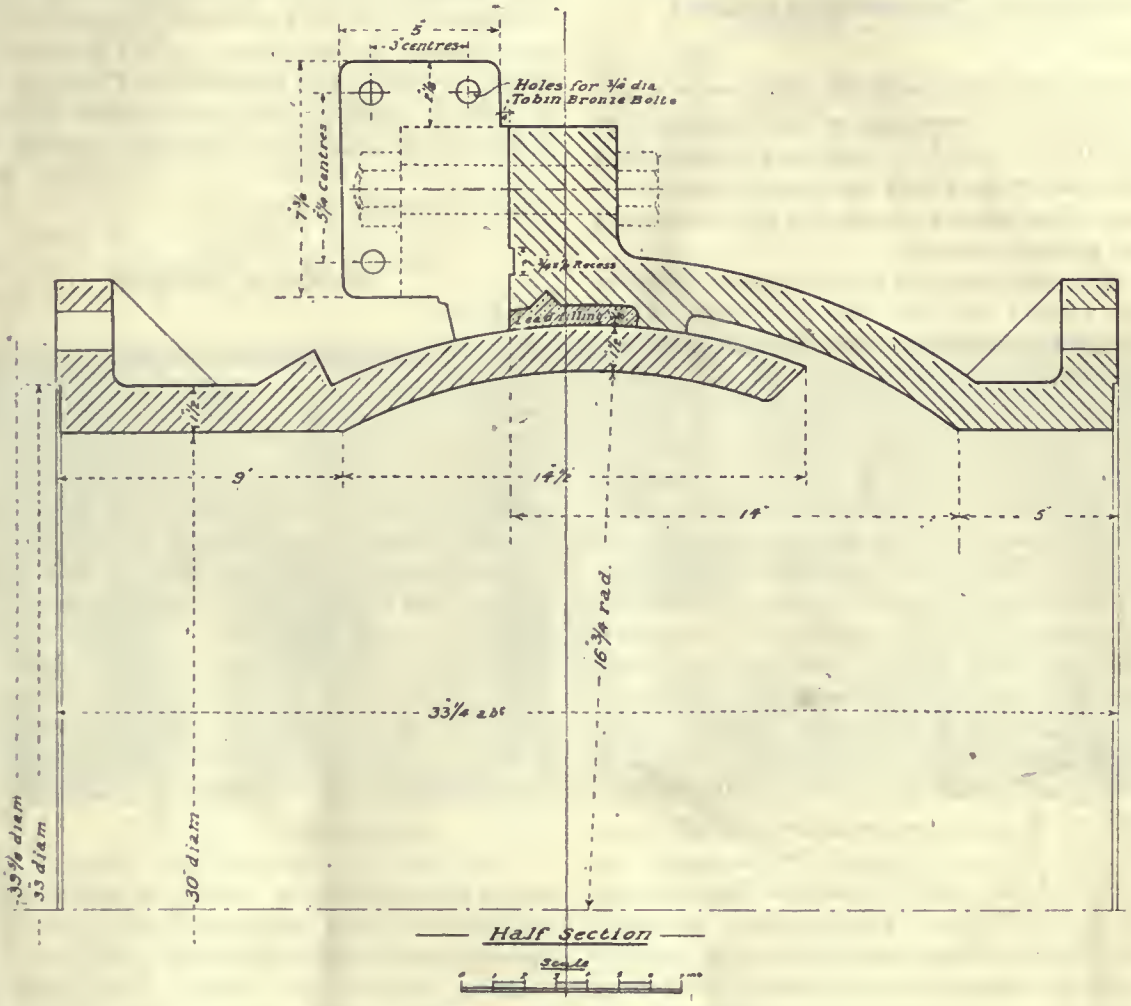
Little Valuable Ground Permanently Lost

Most of the land that has been dredged in the state was originally unsuitable for either horticultural or agricultural purposes. A considerable portion of the dredging land was previously mined by methods in use prior to the development of gold-dredges, and the condition of a considerable portion of this land was such as to make it useless for any other purpose. Open or partly caved shafts and pits, old dumps, and heaps of stones were everywhere, and practically the only vegetation was a few scrubby trees. The acreage of orchards and vineyards already dredged that had been formerly planted would probably not total much over 2000; most of this was around Oroville. The loss resulting from destroying these orchards and vineyards, some of which had already been attacked by the phylloxera and would of neeessity have been destroyed, cannot be considered great. Though there are exceptional cases, it may be said that few of these orchards and vineyards returned much of a profit to their owners prior to dredging. The removal of the tailing for use in the rock-erushing plants is a step toward the ultimate reclamation of that land. After the larger stones have been removed from the ground at Natoma, experiments have been made in planting olive and eucalyptus trees without any further treatment than the addition of a shovelful of loam around the roots of the trees as they are put in place. While only a few acres have been planted in this way, enough has been done to demonstrate the feasibility of the plan and to give ample evidence of the fertility of the ground dredged. Experiments in planting trees and grape vines in the dredge tailing have been made at Oroville by James H. Leggett, and while much of the success of these latter experiments was due to the abundance of elay present—a condition common to that locality that added greatly to the fertility of the tailing—the results show that the ground after dredging is not so worthless as was at first supposed. The result of these experiments have already been described and illustrated in the *Mining and Scientific Press* of October 26, 1912.

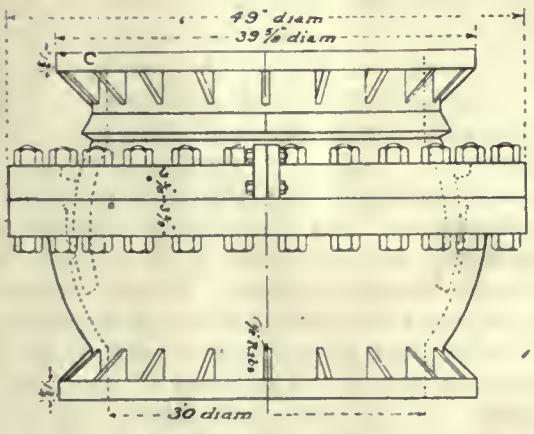
Foreclosure proceedings in the matter of the mortgage on the properties of the Peruvian Mining, Smelting & Refining Co., by A. G. Irigoyen, of Lima, acting under power of attorney for the Old Colony Trust Co., trustees for the bondholders, have recently been concluded. The Commission to revise the old Code of Civil Procedure made its report only a few months ago, and as a consequence an act was passed bringing this new code into force from July 28, 1912. Due to this new code, the proceedings in this case were carried through in less than three months, which constitutes a record in the judicial history of South American republics for an affair of such magnitude. Under the old code of procedure, such a foreclosure would have taken quite six months (more probably a year), and thus the advance which Peru has made in the matter of making it possible for a creditor to secure an expeditious collection of his debt is both praiseworthy and noteworthy. Under the old code of procedure, experts who were to value the property were appointed, one by each party, and in case of disagreement a third was named by the two already chosen. Disputes and delay under this system were common. Under the new code, the experts are appointed by the judge himself, and their report, upon being accepted by the judge, is final, and not open to appeal of any sort.

A Flexible-Joint Siphon

*In the South Island of New Zealand the Government has constructed ditches, for many years, for the supply and sale of water for hydraulic mining. On April 12, 1912, the Kumara district received an impetus by the opening of an extension of the ditch system, which consists of an inverted flexible-joint siphon of 30-in. cast-iron pipe, 10,626 ft. in length, across the valley of the Taramakau river. This conduit delivers 36 cu. ft. of water per second into a distributing ditch, which traverses the higher terraces above the gravel claims, and with its storage reservoir will be able to supply 50 cu. ft. per second for 12 hr. daily, throughout the whole year, for the development of the extensive deposits still unworked in the Westbrook Maori Point, and Hayes Terrace sections. As a power scheme, this conduit has valuable possibilities, as from it about 2600 hp. can be developed at the Government power reserve on the south bank of the river. The cost of this water scheme extension was $96,000, and the accompanying cuts give details of the pipe. The plans were accompanied in the report by three good photographs showing the pipe across the valley, across the full width of the river, and a section of the river and pipe illustrating how it was laid down. Unlike many pipes which cross rivers, this one was laid arch shaped, the top of the arch being against the flow of the river, this bringing all joints into compression and so lessening leaks; whereas, when a pipe is laid straight across the flow, all bolts in joints are in shear and leaks are made more possible. The pipe is anchored by means of piles driven at intervals on either side.



METHOD OF PACKING THE JOINT.



FLEXIBLE JOINT, ASSEMBLED.

*Abstract from annual report of New Zealand Department of Mines for 1911.

Mineral exports from Broken Hill during the first 11 months of 1912 were valued at $19,900,000; and dividends amounted to $8,920,000, to which the Broken Hill South contributed $1,410,000; Sulphide Corporation, $1,400,000; Broken Hill Proprietary, $1,300,000; North, $1,250,000; Zinc Corporation, $850,000; Amalgamated Zinc, $650,000, the two latter from treatment of tailing by flotation.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Treatment of Concentrate at Goldfield

The Editor:

Sir—I read with interest J. W. Hutchinson's article, 'Treatment of Concentrate at the Goldfield Consolidated Mill,' in which he explains at considerable length the theory on which his roasting practice is based and offers various reasons for the satisfactory roast and product secured.

From the composition of the concentrate roasted, it is quite evident that the large percentage of free silica is chiefly responsible for the good roasting. With the presence of free silica a fine subdivision of ore or concentrate particles in roasting is especially favorable to oxidation. It has been long recognized that oxygen (gas) condenses on the surface of finely divided silica (quartz) and certain other oxides and metals at a high temperature, and that these 'contact' substances act as carriers and transmitters of oxygen. Notable examples of these are platinum sponge and ferric oxide, Fe_2O_3. Plattner, in his work on 'Röstproeesse', published more than half a century ago, mentions quartz as a 'contact' mineral and explains its important action in roasting; and the contact proeess of sulphuric acid manufacture is based on this peculiar physical phenomenon. The finely divided silica in the Goldfield concentrate acts in this manner. Furthermore, the quartz prevents the sulphide particles from melting, as, when present in such large quantity, it acts as a diluent forming an infusible mixture. It also acts chemically, decomposing the sulphides. That silica decomposes metallic sulphides and sulphates is a well recognized fact in metallurgy, and its important rôle played in roasting processes is well known. Siliceous ores with a large percentage of free silica are frequently added to sulphides to bring about their decomposition, as well as to prevent their fusion. The rapid rate of decomposition of pyrite in presence of free silica is well illustrated in pyrite smelting, where the oxidation by means of the air-blast is purposely carried on so fast that the ore is smelted, which without free silica could not be accomplished successfully. If the Goldfield concentrate were a sulphide with practically no free silica present, it would be difficult to prevent fusion of the slimed sulphide particles and to secure a sweet roast.

The difficulty of controlling temperatures in roasting and preventing fusion of sulphides has led to the practice of mixing diluents with the charge, and the addition of finely crushed limestone to concentrates is now common practice in copper and lead ore roasting. The heat required for the decomposition of the calcium carbonate $CaCO_3 = CaO \leftrightarrows CO_2$ is furnished by that generated by the oxidation of the sulphides; this causes a lowering of the roasting temperature with the desired result. As the roasting proceeds the calcium carbonate, converted into the sulphate and oxide, keeps the sulphide particles apart and furthers their oxidation. In addition to this favorable action, the admixture of lime with the calcines was greatly responsible for the large increase in the smelting capacity of the copper reverberatory furnaces.

In conclusion, I would say that the silica acts in the following ways in the roasting of the Goldfield concentrate: (1) As a powerful reaction compound, decomposing the sulphides; (2) as a contact substance, or carrier and transmitter of oxygen; (3) as an efficient diluent, preventing fusion of sulphide particles and consequent incomplete roasting.

HERBERT HAAS.

San Francisco, February 1.

Regulating Dredging

The Editor:

Sir—Your timely editorial, 'Regulating Dredging,' which appeared in the issue of February 8, held great interest for me; and if the words contained therein, "any person * * * intending to mine soil for gold," mean literally what they say, this law as proposed will, I am sure, hold considerable interest for every piece of placer ground in the state.

Does this law contemplate that the only means of mining "soil for gold" is by the dredging process? Or may it merely mean that of all the processes for mining soil for gold, only the dredging process shall be placed under the Water Commission? Where no injury to others is done, has the private ownership of land in this state no stronger position than to allow a stranger to the title to name the use to which it may or may not be put?

Considering the relatively few acres of alluvial soil in this state rich enough to be mined for gold: compared with the vast acreage of tillable soil now under cultivation, containing no gold; not to mention the absolutely new areas of agricultural land now monthly being literally 'created' by reclamation, in tracts of from 10,000 to 60,000 acres, does not the "declaration that cultivation of the soil is an ordinary use, necessary for future subsistence, livelihood, and prosperity of the people, and that the use of the soil for dredging purposes is an extraordinary and uncommon use" lose much of its assumed force? Under the wording of the law, as you quote it, it would seem that every 'placer mine' in California must close down (under liability to a fine of $5000) until the status of its soil shall have been legally passed upon by the Water Commission. It may be that I am unduly excited, or too obtuse to understand a matter really of no concern to me, but as the owner in fee of 1200 acres of deep alluvial soil (much of it unquestionably tillable) containing gold, which I am mining by hydraulic process in this state, I write to ask just how far reaching it is intended this proposed law shall be. Just what is it our legislature is intending to regulate? Let's have some light on the matter.

INQUIRER.

Oakland, California, February 14.

[The proposed law is serious enough in terms and is, we believe, entirely unnecessary. The matter is discussed fully in another column.—EDITOR.]

Stimulants and Altitude

The Editor:

Sir—A recent editorial in one of the mining story books on 'Engineers as Financiers' makes incidental reference to the use and misuse of whisky and soda. As it says—it is not true that drinking whisky and soda is injurious, only drinking to excess injures one. Precisely the same thing is true of two other curious human habits. The simile brought to mind a Bolivian condition.

It is a cold and difficult place in which to live and the Government makes it more difficult by exacting very stiff revenues from the alcohol business. Much German and French corn alcohol is consumed by Aimará and Quichua Indian men, women, and children, it really being a necessity due to the cold, the altitude, and the high cost of all foodstuff.

The railways and mine operators are sure that the temperate consumption of 40° alcohol made of corn is a very dangerous occupation—but it does not kill. O. Kempf does not agree. He says a few years will see the Indians vanish.

These same Indians have a habit similar to chewing tobacco. They masticate a cud of the cocoa leaf with a tiny piece of quicklime. The latter seems to be a necessary part of the chew, else the cocaine effect is not experienced. It is a fact that the children do not use the leaf so much, but after a while they "acquire the habit, by no means injurious when followed temperately." It is much cleaner than tobacco and stimulates more than, without exciting like whisky (and soda). The pleasures of cocaine are only given up when they can be replaced by those of 40° corn alcohol. There is not the least doubt that the excessive user of cocoa is annoying to his employer. It is customary to wear a heavy boot, but even with this it is difficult to concentrate a workman's attention, short of three or four hard kicks. It is said to require a long residence to attain the degree of *savoir faire* which an experienced man exhibits in administering these kicks calmly, naturally—smilingly. This is an art difficult to acquire.

The child is supposed not to require the stimulant and rarely begins its use before having reached the age when he takes a wife and starts a family—sometime after twelve. His parents do not advise his adoption of the habit though a father well knows that, "a stimulant is required after a boy becomes a man."

It is this stimulant in Bolivia (like other stimulants elsewhere) which enables the Bolivian Indian to work at high pressure (or altitude, if you prefer) and makes him the peer of his equal anywhere.

MARK R. LAMB.

Santiago, September 13, 1912.

Taxation of Mining Claims

The Editor:

Sir—In the matter of Mr. Joseph's letter and your invitation to say things on the above subject, I submit the following.

The early legislators of Nevada being seized and possessed with a desire (in those days amounting to a passion) to encourage and stimulate mining in all parts of their wonderful state, enacted laws exempting mines from taxation. The result was the absolute reverse of what those good men expected: mining was not encouraged, but speculation and mine owning was encouraged and developed in an astonishing way. It cost nothing to hold mining claims. If they were worth anything, and the owners cared to patent them they could be held without cost. They could also be held by indifferent or pretended assessment work when not patented. To illustrate: many years ago, I met a prospector in Winnemucca who had just come in for a grubstake and wanted help to develop a rich silver lode that he had found. To prove its richness he exhibited well worn pocket specimens. On being asked who owns the claims in the district, he said, "I own one side of the mountain, and Whiskey Dick owns the other." I do not know the object of Nevada's present law to which Mr. Joseph objects, but I do know that the way to encourage mining in Nevada or in any other state is to tax the mines and exempt the improvements. This plan is so simple that I fear your editor in charge of political economy cannot be induced to relate it to the multiplication table or to chemical reactions, yet I must insist that the plan is governed by as unvarying a law as either, and in no other way can mining be really encouraged or miners and mine owners be justly treated by a state.

LONDON

GREAT COBAR, REPORT BY HERZIG.—MEXICO MINES OF EL ORO REMOVES HEADQUARTERS TO FRANCE.

A few weeks ago I gave some particulars of the Great Cobar copper mine in New South Wales, and showed that the mine had now turned the corner and commenced to make profits, though not to pay dividends. Since then, the profits have once more decreased, let us hope only temporarily. For the quarter ended December 31 last, the profit was only £23,071, or just one-third of the figure for the previous quarter. This 'profit' is by no means the real profit, for debenture interest, London expenses, and depreciation have not been charged. A London paper which voices the views of an Anglo-Australian financial firm, continues its bitter attacks on the mine, the directorate, and the management, and is jubilant over the present setback; but it is inadvisable to reproduce its analysis of the position. Let me turn, instead, to a more cheerful item of news, namely, the publication of a report on the mine by Charles S. Herzig. A few months ago, alarming reports had been circulated with regard to the loss of the lode, but subsequently this was proved to be due to an error in driving the level. Mr. Herzig was commissioned by a group of shareholders to go to the mine and make an examination. His report has been bought by the board and issued to the shareholders and the public. His view of things is highly encouraging, and he states that the property is not only of immediate merit, but of great potential value; geologic reasons indicate that its life will be a long one and that it should become a consistent dividend-payer. The subject of the future of the Great Cobar is of such great importance that I quote as follows, Mr. Herzig's account of developments at depth:

"The future outlook for these properties is one of great promise, for we have enormous orebodies which have been consistent producers for a number of years, in which developments at the lowest points show results of a highly favorable character. For instance, in the Cobar mine itself, at the twelfth level around the plat, one of the largest areas so far opened in the mine has been exposed, having an assay value considerably above the average of the mine. The thirteenth or lowest level is opening equally well. The northern orebody has unquestionably taken a more easterly dip than heretofore, so that the additional development which is now being carried out should, if indications prove anything, show a greatly increased tonnage in these levels. Apparently it is increasing in size from the tenth level down. The shaft has proved ore for 60 ft. below the thirteenth level, so that the bottom of the mine is still good. Developments in other directions are giving equally favorable results. The Cobar Chesney mine has a consistent run of valuable ore for about 700 ft., and at the lowest level so far opened up, the seventh, ore of better grade has been found than anywhere else in the mine. In one section high-grade gold ore has been found, and at the other end of the level better copper ore than the mine's average. The cross-cut on the eighth level is now being extended to the orebody. A shoot of ore hitherto untouched below the No. 2 level has been cut on the seventh level, and shows profitable ore for a width of 11 ft. This development is a highly important one. The Cobar gold mine is a deposit of a different class, and the future cannot be forecast with the same degree of certainty as with the other two properties. The only other gold mine in the district has proved value to a greater depth than the Cobar Gold, and to that extent the outlook may be considered hopeful."

The Mexico Mines of El Oro, Ltd., is in future to domicile its management in France, though the registered office will continue to be in London, and the company will continue to be an English one. The object of this new move is to avoid income tax. Seeing that the large majority of shares are held in France and other Continental countries, it is only natural that the directors should desire to prevent these shareholders from paying English income tax on a Mexican venture. The majority of the members of the board are Frenchmen, and the meetings of the directors have been held in Paris for some time. This decision has been based on the interpretation of the law in the celebrated De Beers case. Shareholders in that company are to be found chiefly on the continent of Europe, and though the company is registered under the laws of the Cape of Good Hope, there is also an office in England, where it was alleged the actual direction of affairs was centred. The argument was that wherever the mine and wherever the registered home of the company, the location of the actual management decided the domicile of the company. With income tax at 1s. 2d. in the pound, foreign investors are not keen on an English domicile for their companies. The transferrence of the centre of management of the Mexico Mines of El Oro from London to Paris is a decidedly interesting move.

CLIFTON, ARIZONA

NEW PLANT FOR ARIZONA COPPER.—MINIMUM WAGE LAW.

Construction work upon the new smelting and concentrating plant of the Arizona Copper Co. is making good progress. The concentration plant at Morenci, which now handles the ore from the Humboldt, Clay, Longfellow, and Yavapai mines, is being doubled in size in order to handle an increased tonnage from those mines and also 1000 to 1500 tons per day from the Coronado mine at Metcalf, which will be connected with the concentrator by an electric haulage system. At the Coronado the ore will be delivered through chutes to ore pockets above the adit or 1100-ft. level, whence it will be drawn into 10-ton cars; trains of 20 cars each will be hauled by electric locomotives through the ridge to the 250-ft. level of the No. 6 shaft, where the ore will be dumped into skip pockets and hoisted to the mill-bins.

The concentrator, which was originally designed by C. D. Clark and L. H. D. Forbes, has since been enlarged to a capacity of 1700 tons per day and is now being rebuilt under the direction of David Cole, to a capacity of 3000 to 4000 tons per day. The bin capacity has been increased and a primary crushing plant has been built, consisting of McCully breaker, round trommels, and 54 by 24-in. rolls. The Hancock jigs which have been in use are being replaced by Woodbury jigs, made of concrete, as these are able to handle the unsized product, which now goes to the Hancock jigs, and make a cleaner concentrate for direct smelting. The Huntington mills are being replaced by 8-ft. Hardinge mills, of which 9 have been ordered. These will be longer than the ordinary design, being 36 in. long at the cylindrical part instead of 22 in., as this has been found to give increased grinding capacity without an equal increase of power and weight of pebbles. These mills are being manufactured by the Allis-Chalmers Co., which, together with the Power & Mining Machinery Co., has furnished most of the equipment. The present Wilfley tables and vanners will be retained, but more refined methods of the classification of the fine material are expected to yield a better extraction.

At the new smelting plant, which is being constructed on the San Francisco river, about two miles below Clifton, and a mile from the Shannon smelter, the roasting plant consisting of eight 21-ft. Herreshoff furnaces, is practically completed, together with its accompanying dust chambers. The main chimney is also finished and work on the reverberatory plant is well advanced; 10 waste-heat boilers are already in place, and the brickwork on three reverberatory furnaces is well advanced. The power-house is rapidly being put in shape, and it is hoped to have it in operation by July; the smelting plant as a whole will probably be blown in before the end of the year. A full crew is at work under the supervision of E. Hanton Jones; Norman Carmichael is general manager. L. D. Ricketts is consulting engineer for the company. David Cole has designed the new concentrator, and Repath & McGregor the smelting plant.

Mining men throughout Arizona are vitally concerned in the proposed minimum-wage law which has been introduced in the first legislature, now in session. This provides that in all hazardous occupations, among which mining and smelting are classed, the minimum wage for eight hours of work shall be $4. It is not at all probable that the bill will secure passage, as its provisions are so unreasonable, the class of miners now available in the Clifton district receiving $2.25 per shift; but if it should be enacted, the results will scarcely be what its proponents expect. If the mining companies are compelled by law to increase wages to such an extent, they will naturally bring in more skilled men from other mining districts, who are able to do $4 worth of work per shift, and the condition of the present mining population, instead of being bettered, will be rendered worse. Possibly this is what the sponsors of the law desire, as it will be remembered that the Kinney bill, which failed of passage a year ago, provided that men should not be allowed to engage in hazardous occupations unless they were able to read and write the English language. It is quite probable that the legislators have something else in mind than the welfare of the Mexicans who perform a large part of the labor in mining and smelting throughout Arizona.

HOUGHTON, MICHIGAN

MINE-RESCUE WORK.—COMPENSATION LAW.

In the Lake Superior mining regions, to quote a mine superintendent, "a Red Cross craze is on." A United States mine-rescue car has been obtained through the Bureau of Mines and will be stationed at Ironwood, Michigan, to serve the iron ranges of Michigan and Minnesota and the copper country of Michigan. The larger mining companies are training first-aid crews at all their mines, in order that the employees shall know how to care for a man with broken bones, overcome by gas, or injured by electrical accidents. Both surface and underground crews are trained. The underground crew is selected from men familiar with the mine, such as timbermen and trackmen. Also, crews are trained in the use of the oxygen helmet and pulmotor, and such apparatus is maintained in some central locality. The Cleveland-Cliffs Iron Co. has held exhibitions and competitive contests at Ishpeming, at which crews from its different mines took part, and has awarded prizes to the teams judged best. This company intends to train a new first-aid crew at each mine every year, so that in time nearly all the employees will be competent. The direct cause of the interest in mine-rescue work was the mine fire in the Hartford mine of the Republic Iron & Steel Co. in Negaunee, in the spring of 1911, when seven men were killed.

Another reform which the mining companies have succeeded in bringing about is the Michigan State Compensation Law, which went into effect September 1, 1912. This law is optional with employers and employees, but the terms are such that it is to the interest of both to agree to come under its terms. Under the old laws, when a man was injured in a mine and though he deserved damage payments, he went to a lawyer and started suit against the mining company. Usually he lost the suit, at considerable expense to himself and the company. In case he won, the lawyer took from 50 to 100% of the money awarded. In some cases where the injured man and his lawyer succeeded in working up a strong feeling against the mining company, the sum awarded the plaintiff was out of all proportion to his injury. Under the new Compensation Act, an injured man or his heirs can collect a stipulated sum or series of payments from the company without going to law, and without any long delay intervening. A certain amount is named for each accident that might arise, so much for death, so much for injury incapacitating a man for work, so much for broken finger, loss of eye, etc. The payments stipulated are in all cases fair, and in some surprisingly large.

Thus, in place of the lawyers securing the bulk of the money spent for accident compensation, the injured man and his family receive it.

BOSTON

GRANBY FINANCES.—GIROUX CONTEST POSSIBLE.

Stockholders have confirmed the action of the directors of the Granby Consolidated, authorizing an issue of $5,000,000 6% convertible bonds. An increase in capital stock from $15,000,000 to $20,000,000 is authorized. The Granby bonds have been underwritten by Speyer & Co., of New Work, at 96, 1% being commission and 3% bonus. The Granby president says the Hidden Creek ore assays in copper about double that of the original Phoenix mine. An interesting feature of the meeting was the announcement that Granby has other acquisitions under consideration.

Rumors keep reaching Boston of dissatisfaction over the management of the Giroux Consolidated at Ely under Thomas F. Cole. It is said that the development policy does not have the sanction of a large group of stockholders and that they contemplate soliciting proxies with the view of bringing about a change of management. Some of these stockholders believe that the control of the property does not lie with Mr. Cole and his associates, and that a fight for control might be successful. It is said that the output of Giroux for February exceeded all previous records, running above 1200 tons per day, and that the ores are showing some increase in value, assaying about 2.3% copper. The caving system is to be started in the underground workings of the Morris mine, experts from Michigan having gone there recently to take charge of this work. The Coppermines company, controlled by the Gunn-Thompson interests, has been under steady development ever since the strike was settled, but is not yet shipping. It is believed in Boston that eventually there will be a merger of the two. Interests here connected with the Smokey Development Co. deny the probability of that company becoming a party to the merger, pointing out that it is yet a prospect, but has been fully financed for some time to come and is without any incentive to sell at present.

JOHANNESBURG, TRANSVAAL

RANDFONTEIN MEETING.—INCREASED ORE RESERVE.—IMPROVED CONDITIONS WARRANT EXPECTATION OF STEADY WORK.

The feature of the week has been the meeting of the Randfontein Central Mines, which, until last month, for several months past figured as the largest gold producer on the Rand. The magnitude of the operations carried on may be gathered from the fact that in 1912 a total of 733,780 oz. of fine gold was produced, of a value of £3,074,476, a total closely approaching a month's output for the whole of the Rand. Even then this property has been far from working at full pressure during the year. The huge mill of 600 stamps and four others of 100 stamps each represents a milling equipment of 1000 stamps. If allowance be made for the tube-mills as auxiliaries, the milling capacity perhaps will come close to being equivalent to 1500 stamps. This huge equipment has caused some trouble during the year to keep it employed to three-fourths of its capacity owing to want of rock and labor, but labor is now getting more plentiful, the smaller mills have been thoroughly overhauled, and the year has started with far better prospects than was the case twelve months ago. It is officially stated now that all the stamps are expected to be dropped in three months' time, a feat which accomplished, ought to enable the property to again take up the position as the largest gold producer of the world. It has been apparent during the year that it was impossible to keep the huge Central mill fed with rock by the mines in the immediate neighborhood, and ore had to be brought from the southern end even to keep a limited number of stamps at work, but the prospects of the huge mill getting into full swing are more encouraging, and less is now heard about the mill proving itself a 'white elephant.' The best feature of the report for last year was the announcement that the ore reserves had increased nearly a million tons during the year, bringing the total to 7,600,000 tons, of which 6,350,781 tons assayed on the average 6.8 dwt. per ton. It is estimated that when the whole of the ore-

reduction plant is at work some 3,100,000 tons yer year will be crushed, so that practically there are two years of ore in front of the mill. As things go on the Rand, this may not be considered an excessive reserve, but the position has materially improved since the huge mill was started about two years ago. To have gained an additional million tons of development ore during the year appears a notable achievement and would have appeared more so had it been developed in some of the old mines, but it must not be forgotten that several additional outcropping reefs have been discovered during the year which have readily lent themselves to development. It is claimed for the Randfontein property, with its extensive area and numerous payable reefs, that its resources are unequaled by any other mining property on the Rand. There is, no doubt a great deal of truth in this statement, but the geological conditions surrounding the Randfontein property are not such that two or even three years' supply of payable ore in sight should justify the erection of such a huge mill as that at Randfontein. A fall in the grade in the mines in the northern section of the property gave considerable trouble during the year, and it is to be noted that while the profitable ore reserves averaged 7.29 dwt. in 1911, the average had fallen in 1912 to 6.8 pennyweights.

JOPLIN, MISSOURI

DECLINE IN PRICES CAUSES SHUT-DOWN OF MINES.—MINING SHORT CREEK GRAVELS.—CALAMINE AT DUENWEG.

The average production of 5500 to 6500 tons of zincblende per week has been cut to about 3500 tons in the Missouri-Kansas-Oklahoma district, due to the closing of many large mines following the decline in the prices of both zinc metal and zinc ore, the former having dropped to $6.10 at the beginning of March, while the price of zincblende now ranges from $40 to $48 per ton, assay basis of 60% metallic zinc, with choicer grades bringing as high as $51. The greatest number of mines to close are in the sheet-ground district of Webb City and Carterville, where the cost of operation is high and the recovery small. Many of these mines cannot produce concentrate at a profit at the prices now prevailing. Several meetings of the largest operators have been held within the past two weeks, and these meetings resulted in coöperation in the matter of curtailing the output.

Two companies are conducting interesting mining operations at West Galena, Kansas. They are Woods & Anthony, holding a lease on a large portion of the 320-acre tract of Bonanza Mining Co.'s land, and Ryan Brothers, operating on a lease of the Empire District Electric Co.'s property. Both are milling the gravel and sediment taken from the bed of Short creek, the course of the stream having been diverted so that the old channel is now dry. The stream heads at the old Pumpkin Head mine, one mile west of Joplin, and flows through the heavy producing zinc and lead districts of Ellisville, Cave Springs, and Galena. In these, and especially in Galena, mining operations have been conducted for many years, and the mine waters pouring into Short creek have carried zinc and lead sediment until the entire creek bed, to its mouth four miles west of Galena where it empties into Spring river, has become mineralized. The Galena mines have been working steadily for more than 25 years, and not only has a heavy volume of fine material been carried down-stream in the mine-waters, but in times of floods entire heaps of concentrate have been swept away and have helped enrich the lower portion of the creek bed. Woods & Anthony have a lease on the creek about two miles from the point where it empties into Spring river, while Ryan Brothers have a lease at the mouth of the creek. Both companies have erected sludge mills and use scrapers and mules to drag the mineral-bearing sediment to their plants. The creek bed is from 10 to 50 ft. wide and is richly mineralized to a depth of 3 to 5 ft. The mill recovery is from 15 to 20%, the greatest percentage of recovery being zincblende, although some lead is also won.

One of the greatest handicaps in shaft sinking in this district—the necessity of draining the ground continuously as the sinking progresses—was overcome in a novel but decidedly satisfactory manner at the Minor Heir-Sunrise mine, on a lease of the J. W. Allen land at Spring City, Missouri. First a 6-in. drill-hole was sunk to the level of the old workings at a depth of 185 ft., and a small drift was extended to connect the old drifts with the hole. The new shaft was sunk on the drill-hole, care being taken to keep the hole clear of débris, and thus it acted as a drain through which the water seeped to the lower ground, from which point it was pumped out. Ordinarily the task of seating and removing the pump in shaft sinking, which is a tedious and expensive operation, greatly delays the work. The Minor Heir-Sunrise new shaft is 7 by 8 ft. in the clear and was sunk in seven weeks, three shifts per day doing the work. The shaft is 700 ft. from the mill and is connected by a long tramway, 82 ft. in height at the highest point.

Calamine mining in the Duenweg, Missouri, camp is more active than it has been in years. On the Henry Weymann land east of the camp, on the McGee Mining Co.'s properties to the east and northeast of the camp, and at the old Central States mines, south of the camp, prospecting has been in progress, and some exceptionally good finds have been made recently. The ore occurs at shallow levels, seldom being found in this district at a greater depth than 100 ft. It will average about 43% metallic zinc, sometimes running as high as 50%. It is sold on a 40% basis and a premium of $1 per ton is paid for each percentage above that. The prevailing price at present for 40% ore is from $26 to $28 per ton, while choicer grades bring as high as $38. The cost of mining the ore and getting it ready for the smelter is small, and hand jigs are frequently used.

NEW YORK

COPPER DULL.—GUGGENHEIM MEETING.—HOMESTAKE AFFAIRS. HAGGIN AND MILLS.—GENERAL DEVELOPMENT COMPANY.

The copper situation remains weak, with the larger sellers maintaining a price of 15c. The depressing factors are the commercial standstill in Europe and the apparent possibility that Mexico will finally manage to embroil herself in tronble with the United States. The general atmosphere in New York remains very largely pessimistic. Some profess to believe that when the incoming administration shall

COPPER-CASTING MACHINE AT NEVADA CONSOLIDATED WITH OIL-FIRED RECEIVER MADE FROM OLD CONVERTER.

have been settled in office there will be a quick revulsion of sentiment. In the meantime, however, stocks, especially the coppers, are off and weak.

The quarterly meeting of the various Guggenheim companies left results mixed. The spectacular achievements of Chino during the past year had rather led to the anticipation of an initial dividend at this time. Ray Consolidated had also been expected to join the list of dividend payers, and it was something of a shock that the stockholders received an explanation instead of a dividend. The board's action is stated to be wholly due to the unsatisfactory copper market; that the management does not consider the necessity for dividends so pressing as to justify borrowing the money against unsold copper. The regular quarterly dividends were declared by the Utah Copper Co. and the Nevada Consolidated, the former paying 75c. per

share, the latter 37½c. It seems impossible to discover the real status of affairs as between legal authorities at Washington and the A. S. & R. Co. It is repeatedly heard that a rigid investigation is being made and that vigorous action will follow, but confirmation cannot be obtained from any authoritative government official.

Carrying out the plan recently announced to increase the capital stock of the Homestake Mining Co., the directors have declared a cash dividend of 65c. per share and a stock dividend of 15%, both payable March 25. Arrangement has been made to mail to shareholders fractional scrip to avoid issuing fractional shares, and the Columbia-Knickerbocker Trust Co., of New York City, will buy all fractional scrip offered on a basis of $100 per share, or will sell such fractional scrip as needed by any holder to make up a full share, at the same price. James B. Haggin has been very active during recent weeks with the affairs of the Homestake, and his big silver-gray limousine may be seen standing in front of the Mills building both early and late. Mr. Haggin keeps business hours that might put to shame many younger men who toil in his vicinity. The Mills building, of New York City, despite the fact that it was not many years ago pointed out as one of the sights of the financial district, is rapidly coming to be classed as a bit of old New York, and it holds or has held not a few tenants about whose names there clings a vast deal of reminiscence. D. O. Mills, lately deceased, was long a notable figure in San Francisco as well as in New York, and in mining circles was probably best known for his operations in the Coeur d'Alene, particularly in the Bunker Hill & Sullivan. Some of Mr. Haggin's old-time associates made their business homes in the Mills building for many years; the Hearst estate still has its offices there, as also has the firm of Lounsbery & Co., both of the latter having been interested with Mr. Haggin in the Homestake and in the old American Mining Co., which was taken over by the El Oro Mining & Railway Co., Ltd., of El Oro, Mexico. Another notable who until his recent death had for many years maintained an office in the Mills building, was H. McKay Twombly, who was known as the 'sulphur king.'

The General Development Co. has just increased its capital stock from $2,600,000 to $3,000,000 to provide means to absorb the Silver Mines Exploration Co. The latter was organized some five years ago by Adolph Lewisohn and his associates to take up the work of handling mining properties in Canada. It was through this organization that the development of Kerr Lake and of the Wettlaufer-Lorraine was carried on. The latter named company has just passed its regular quarterly dividend and the market in the issue has been consequently one of the soft spots.

BRITISH COLUMBIA

DIVIDENDS AND DEVELOPMENT MARK PROGRESS.

The year opened with two dividends paid in January by metalliferous mining companies operating in the province, and one declared payable on March 1. Those paid were by the Standard Silver-Lead Mining Co., with mine and concentrating mill near Silverton, Slocan lake, of $50,000, being this company's regular monthly dividend at the rate of 2½% on its issued capital of $2,000,000; and by the British Columbia Copper Co., with copper mines and smelting works in Boundary district, of $88,756, being a quarterly distribution of 15c. per share. The dividend payable on March 1 is that of the Granby Consolidated M. S. & P. Co., at the rate of 1½%, approximately $225,000.

East Kootenay.—The Consolidated Mining & Smelting Co. during January shipped about 3600 tons of lead ore from the Sullivan Group mine to its smelting works at Trail. Much exploratory work having been done in new ground last year, an enlarged production of ore is looked for in 1913. Operations at the company's St. Eugene mine are now on a much smaller scale than in past years, but there is still a small ore-production being maintained.

At the several collieries in southeast Kootenay coal-mining is generally active, though occasionally the output is unfavorably affected by a shortage of railway cars. One colliery, that of the Corbin Coal & Coke Co., of Spokane, Washington, with coal mines situated some 14 miles south of McGillivray, a station on the C. P. R. Co.'s Crowsnest railway, is preparing to mine coal open-cast, having cleared off the surface débris from a considerable area so as to allow of the big deposit of coal, occurring almost at the surface and proved to be fully 300 ft. wide, being worked as an open quarry. It is proposed to use a steam-shovel to take the coal direct from the face and load into railway cars.

West Kootenay.—Deep snow has interfered somewhat with mining operations in Ainsworth and Slocan divisions, though mines situated near one or other of the lakes have not had similar transportation difficulties to those in the midst of the mountains. The Bluebell, near Kootenay lake, and the Standard and Van-Roi, near Slocan lake, have kept up their respective outputs with little or no diminution. The Rambler-Cariboo and Ruth have also made shipments, though on a smaller scale. It is expected that the former of these two will this year produce much more ore than in earlier years, for it now has much improved transportation facilities, an aerial tramway having been constructed from the mine down to the concentrating mill recently completed alongside a newly finished branch railway line. Near Sandon, deep level development is being continued on the Slocan Star and Payne mines, but snowslides and accompanying winter difficulties have made it necessary to practically suspend work for the time at several mines in the vicinity of Cody. The Lucky Jim mine, situated on the divide between Slocan and Ainsworth divisions, and the Retallack & Co. and Utica mines, on the Ainsworth side of that divide, are among the operative mines of this part of West Kootenay district.

In Nelson division, the British Columbia Copper Co. is continuing development of the Eureka copper mine, under option of purchase, and is shipping copper ore from the Queen Victoria mine, purchased last November, to its smelting works at Greenwood. The Kootenay Gold Mines, Ltd., is endeavoring to obtain additional capital for the purpose of doing needed development, so as to keep its 20-stamp mill regularly running. The Consolidated company's Molly Gibson silver-lead mine is one of the shippers of this division. In Ymir camp development is being continued at the Wilcox and Dundee mines. Near Salmo, the Emerald and H. B. are shipping lead ore, gold ore is being crushed at the respective stamp-mills of the Motherlode and Queen in Sheep Creek camp, and the Second Relief in Erie camp, while the Arlington, also at Erie, is being worked under lease.

Boundary and Similkameen.—The big copper mines of Boundary district are maintaining their normal output of ore. The largest producers were the mines at Phoenix of the Granby company, the British Columbia Copper Co.'s Motherlode coming next, and the New Dominion Copper Co.'s Rawhide mine being third; several small mines added to the total production for January. The B. C. Copper Co.'s new general manager, Oscar Lachmund, has been in local charge several weeks. No information is yet available concerning the company's future operations in Similkameen district, but it is known that the Hedley Gold Mining Co., operating in Hedley camp, continues to crush 5000 to 6000 tons of gold ore per month and to make good profits.

Coast District.—The Britannia, near Vancouver city, and the Granby company's Hidden Creek mines in the vicinity of Observatory inlet, are doing the chief development in connection with metalliferous mining on the British Columbia coast. The Marble Bay mine, on Texada island, in which bornite ore has been mined down to a depth of 1000 ft., is now opening a level at about 1100 ft. vertical depth. Important developments are taking place on several coal-mining properties on Vancouver island. The Western Fuel Co., of San Francisco, has already spent $500,000 in connection with the opening, equipment, and transportation facilities of a new mine within five miles of Nanaimo. The Pacific Coast Coal Mines, Ltd., has just reached coal in a new shaft, at 610 ft. from the surface. The Canadian Collieries (Dunsmuir), Ltd., is also opening a new mine, this being in Comox district, Vancouver island.

General Mining News

ALASKA

FAIRBANKS

The Wild Rose claim, on Dome creek, produced $930 from 26 tons of ore crushed at the Spalding mill. It is proposed by the Minook Gold Dredging Co. to erect a dredge on Big Minook creek, in the Rampart district. The ground is from 10 to 30 ft. deep, and there are no boulders to hinder work. The dredge will be of the Bucyrus make, and may be in operation about the end of next summer.

ARIZONA

COCHISE COUNTY

The Calumet & Arizona company has acquired the Saginaw mine on the basis of one C. & A. share for 6¼ Saginaw shares, while the company will distribute 800 shares of C. & A. *pro rata* from stock held in the Saginaw treasury.

GILA COUNTY

(Special Correspondence.)—At the Inspiration Consolidated Copper Co.'s property all work at the millsite, on the railroad grading, and underground work at the Inspiration division of the property has been discontinued for several days on account of the severe weather that has rendered outdoor work impossible and has made it impossible to deliver fuel and other supplies at the operating centres. The Live Oak division of the property, however, has been more fortunate, having had a sufficient supply of oil and other necessaries on hand to continue work at a normal rate. The cessation of the storm on the last day of February indicates that the work will be resumed throughout the property's area within a few days. At the Old Dominion, underground work is proceeding in a manner that insures a normal output of ore for the month of February, but the unprecedented storms that prevailed during that month necessitated suspension of nearly all construction work at the mine. The Great Falls type of converters installed at the plant early in January are proving satisfactory in every respect. Because of the severe weather prevailing during the greater part of the past month, the Gibson Copper Co. has been unable to deliver fuel at its plant, and the working force at the mine has been reduced nearly one-half. The management expresses its intention to install oil burners as soon as possible. The rich ore that was traversed throughout the raise from the 800-ft. level to the 600-ft. level of the Superior & Boston, southeast of the McGaw shaft, continues on and above the 600-ft. level. As the ore dips under Quo Vadis hill, it seems certain that an extensive body of mineral will be disclosed to the southeast, and below the present ore disclosure. Beyond the installation of a reinforced concrete arch on the line of the switchback, beneath the tramway that carries supplies from the valley to the Miami mill and shafts, there has been little surface improvement at the property during February, because of the severe storms that have been prevalent during the greater part of the month. B. Britton Gottsberger, general manager, is expected to recover from two operations performed to relieve him of appendicitis. At the South Live Oak Development Co.'s property it has been impossible to begin drilling at hole No. 7 because of the severity of the weather. The results at hole No. 6 are reported by the management as wholly satisfactory.

Miami, February 28.

GREENLEE COUNTY

It is stated that the Apache Box group of 11 claims near Duncan have been taken on option by the Copper Queen Consolidated Mining Co., of Bisbee. The terms are 90 days and payment of $250,000 cash.

CALIFORNIA

BUTTE COUNTY

The boiler, hoist, and house of the Crystal Hill mine, near Magalia, were destroyed by fire on March 3. The loss is $3000, and the mine is rapidly filling with water.

ELDORADO COUNTY

The Nonpareil mine, in the Georgetown mining district, has been leased for 10 years to I. P. Allen, of the Canton bank, San Francisco. Shafts have been sunk to prove the width of the old river channel, which is 250 ft. wide. This is 50 ft. more than the old Gold Channel mine.

NEVADA COUNTY

(Special Correspondence.)—The North Star Mines Co. disbursed $300,000 in dividends during 1912, making a total of $3,786,989 paid to stockholders since organization. The par value of issued stock is $2,500,000; consequently, the company has paid in excess of $1,250,000 over the original valuation. The property is the deepest incline mine in California and the leading gold producer of the state. Besides actively developing its main holdings, the company is vigorously exploring and developing the Champion mine and other claims. Sacramento people are actively developing the Montana mine, in the Willow valley district. A cross-cut is being extended to the vein and some excellent ore has been recently extracted from the upper workings. The Norton shaft is being raised to connect with the Lecompton. Considerable prospecting and development continues in the Deadman Flat region. This district has been particularly noted for rich pockets.

Grass Valley, February 24.

A few years ago the Brunswick Mining Co., upon the advice of the manager, C. H. Mallen, decided to sink a new vertical shaft 3000 ft. south of the old incline. A modern electrical equipment was erected, and the shaft was sunk 400 ft., when a heavy flow of water was encountered. It was then decided to pump through the old workings and raise to the new shaft from the long south drift on the 1250-ft. level. A Dow electric pump of 1200-gal. capacity per minute, and costing $7000, was used to cope with the water. The problem was not too easy, as a circular surface and underground survey of over a mile was necessary to get the correct starting point for the raise. This was done by E. C. Uren, of Nevada City, and F. M. Miller of Grass Valley. Work was started on April 1, 1912, and the raise was driven 474 ft., a splendid connection being made a few days ago. The shaft will be sunk a further 200 ft., when the lode will be cut. The shaft is 8 by 18 ft., and the raise 5 by 12 ft., the latter to be enlarged to the former size for three compartments. Blasting in the raise was done by electricity, by what is known as the 'delay system.' The contractors were W. C. Gans, J. R. Thompson, G. G. Johnston, J. A. Eddy, F. Kult, and W. J. Mow. The connection has improved ventilation considerably. It is proposed to erect another 20 stamps, while a 220-hp. Ingersoll-Rand air-compressor is on its way to the mine. In all, 82 men are employed.

SHASTA COUNTY

An engine is being installed at the old Quartz Hill mine, near Redding. This mine is under lease to the Mammoth Copper Co. for three years, and has a large body of siliclous ore. At the Stowell mines, under option to the Mammoth company, all machinery is ready for operation. Eight machine-drills will be employed on development.

SIERRA COUNTY

The Tightner mine at Alleghany continues to give high returns, and the last two bullion shipments to the Selby smelter were worth about $87,000, while the new ore-shoot cut in the lower adit four months ago has yielded about $250,000. Twenty-five men are employed, and the 10-stamp mill is working steadily on ore from 600-ft. depth. The Tightner company will advance the lower adit toward the Red Star claim, which it has under bond.

COLORADO

DOLORES COUNTY

The annual report of the Rico-Wellington Mining Co. states that ore production consisted of lead ore, 463 tons, worth $11,477; copper ore, 4596 tons, worth $79,657; zinc ore, 1068 tons, worth $20,389; a total value of $111,523. Total receipts, including loan from Knight Investment Co., were $155,284. Due to this company is $78,769, and the cash overdraft is $6626. Development covered 3822 ft., and

about 11,000 tons of lead-zinc ore is ready for mining. Generally, development has been of a gratifying character. A two-bucket tramway, extending 2500 ft. from the Wellington adit to the Winkfield switch on the Rio Grande Southern railroad, has been constructed. Its capacity is 50 to 60 tons in 8 hours, at a cost of 23c. per ton. A platform 25 ft. below the adit has a storage capacity of over 4000 tons. The Pro Patria mill, belonging to the Rico Mines Co., has been leased for 5 years, $30,000 is being spent on its remodeling and power-plant, and it should be soon in operation.

Eagle County

Several mining men have returned from the Brush creek new district and state that the ore is found in a shaly limestone, above which, toward the top of Horse mountain, is a red sandstone dipping east. Still higher at the top of the mountain is a white sandstone dipping northeast. About 10 ft. above the orebody a fault can be seen in the mountain. Below the orebody is found a blue limestone. H. E. Burton has made analyses of the ore, and has classified it as a 'silver vanadate,' an entirely new mineral. Samples have been sent by him to the School of Mines at Golden for further study.

Lake County (Leadville)

Several years ago it was proposed to drive a tunnel through Mosquito range, from the head of Empire gulch, but after surveys were made the project was abandoned. The work is again being discussed. The tunnel would be 3869 ft. long, and would give a depth of 900 ft. and test various properties at depth, besides draining them. It would also benefit Leadville in many ways.

San Miguel County

The Tomboy mill worked 29 days in January, and treated 11,000 tons of ore yielding $33,500, and $57,000 from 1400

CARRYING LUMBER TO THE TOMBOY MINE.

tons of concrete shipped. Working expenses were $51,000, leaving a profit of $39,500. Expenditure on the aerial tramway was $11,600.

Teller County (Cripple Creek)

The February production of the Cripple Creek district is given as follows:

Plant.	Tonnage.	Av. val.	Total.
Portland	9,500	$21.00	$ 199,500
Golden Cycle	28,500	20.00	570,000
Stratton's Independence	10,767	2.78	29,832
Wild Horse	1,000	3.60	3,600
Portland	14,200	3.16	44,872
Isabella	1,000	1.50	1,500
Gaylord	1,800	2.20	3,960
Smelters	3,610	65.00	234,650
Jo Dandy	1,465	2.00	2,930
Colburn	1,925	3.00	5,775
Total	73,767		$1,096,619

It is probable that the Gold Dollar Consolidated Mining Co. will reduce its royalties to lessees. During 1912, development in the Isabella mines covered 11,127 ft. Ore production by the company amounted to 2181 tons, worth $30,692; by lessees, 10,098 tons, worth $202,592; and from dumps, 8730 tons, worth $76,797.

In the Vindicator mine, what is known as No. 1 vein, where found on the 1400-ft. level, was poor. On the 1500-ft. level the shoot was 100 ft. long, but of low value; while on the 1600-ft. level 10 ft. of ore, worth $30 per ton, has been cut 400 ft. south of the main shaft.

The report of the United Gold Mines Co. for the year ended December 31, 1912, gives the following:

Lessees ore production, tons	16,172
Value	$136,484
Freight and treatment	62,087
Paid to lessees	57,857
Royalty	15,763
Net income for company	14,879

The production of each of the company's mines were as below:

	Tons.	Value.	Av. val.
W. P. H. group	2,458	$ 35,531.73	$14.46
Deadwood	1,350	16,963.69	12.56
Damon	1,090	10,411.21	9.55
Wild Horse	780	34,268.02	43.93
May B.	238	4,622.29	19.42
Wild Horse mill	10,256	34,686.83	3.38
Totals	16,172	$136,483.77	$ 8.44

IDAHO

Blaine County

The Danaher M. & M. Co.'s new mill, which cost about $70,000, is in full operation. It is at present treating ore from the upper dump, which contains 80,000 tons of ore. On February 24 the jigs produced 2800 lb. and the vanners 1100 lb. of concentrate in 7 hours.

Bonner County

Officials of the International Smelting & Refining Co. of Tooele, Utah, are conferring with the president of the Idaho-Continental Mining Co. in connection with the Idaho-Continental mine near Porthill.

Idaho County

At the American Eagle mine a shaft is being sunk 200 ft. below the adit level. It is of two compartments and is to be timbered with sawn lumber the whole depth. The rock is hard, and the contract will be finished by May 1.

Shoshone County

The Federal Mining & Smelting Co. has taken a two-year option on the Flynn group of mines, in the Coeur d'Alene district, for $150,000. The Frisco adit, now in 1800 ft., will be extended 2000 ft. to cut the Flynn veins at a depth of 2000 to 2500 ft. The Snowstorm Mining Co. is paying a dividend of $15,000 on April 1.

MONTANA

Cascade County

Development in the Florence mine at Neihart is encouraging. The vein has been found again south of the fault on the 300 and 500-ft. levels, and is being driven on. Ore being shipped contains 50 oz. silver per ton, and the January output gave net earnings of $6000.

Lincoln County

(Special Correspondence.)—D. H. Tandy, who owns some placer claims on the Yakt river, at what is known as Snipetown, while in this town on February 21, stated that his claims are in shape to be operated during the coming summer. He has put in a hydraulic plant, which will be used in washing out the gravel. This plant was completed last fall, just at the time when the first cold weather started. Mr. Tandy formerly published a newspaper at Hillyard, Washington.

Duncan McDonald and George McKay, who came in last week from their mining claims on Granite creek, report that they now have an excellent showing in the Porcupine claim. They have driven on the vein for 35 ft., where they have a 3-ft. vein of silver-lead ore, the samples they brought in being particularly fine.

Libby, February 24.

NEVADA

Churchill County

During January the Nevada Hills Mining Co. treated 2738 tons of ore, valued at $17 per ton, the loss in tailing being $2.02 per ton, making the yield $41,005. The net profit for the month was $12,929. Recovery by concentration was 13.3%, and by cyanidation 74.8%, making a total of 88.1%. Costs were: mining, $4.57; milling, $3.75; marketing, interest, taxes, and general, $1.87; a total of $10.19 per ton.

Clark County

The Tramp Miner Mining Co. has a property 17 miles from St. Thomas, and is shipping ore that returns 34% copper at Salt Lake. The mine is worked by adits, and has been opened to 350 ft. Near the copper ore is a large body of iron ore carrying 51% iron and 3% copper. Heavy shipments of zinc ore are being made from the Goodsprings district, the monthly totals being about 3000 tons, averaging 40% zinc and 58% lead. The Yellow Pine is shipping 70 tons of zinc concentrate daily, carrying 36% zinc, and 30 tons of lead concentrate with 60% lead and 40 oz. of silver.

Esmeralda County

The Goldfield Consolidated Mines Co. has declared a dividend of 30c. per share, amounting to $1,067,700. The Goldfield district mines and mills, numbering nineteen, are employing 833 men at present, of whom 621 are employed by the Consolidated company, 60 by the Merger company, 22 by the Jumbo Extension, and 20 by the Western Ore Purchasing Co. The sampler of the last-mentioned company at Millers, Nye county, is to be reopened, and that at Hazen, in Churchill county, will be kept in commission. The Consolidated company is sending about 100 tons of ore to smelters from the Grizzly Bear and Clermont mines.

Lyon County

Matte produced by the Mason Valley smelter has been shipped so far, but it is now intended to erect two converters with a monthly capacity of 4,000,000 lb. of copper. A blowing-engine will also be needed, and the new plant will cost about $75,000.

Nye County

The Tramp Consolidated, Bullfrog Sunset, and Denver Bullfrog Annex properties, all in the Bullfrog district, near Rhyolite, and controlled by the Sunset Mining & Development Co., have been examined and sampled during the past two months. Sampling has disclosed lodes varying from 4 to 36 ft. wide, worth from $2 to $30 per ton. An air-compressor and machine-drills are to be installed, and it is proposed to erect a cyanide plant with a capacity of 5000 tons per month.

During the week ended March 1, the Tonopah mines produced 11,677 tons of ore valued at $245,802, making a total for the current year of 98,414 tons and $2,060,684.

Storey County

In the annual report of the State Controller the mineral production of the Nevada is given, and that of the Comstock district from October 1, 1911, to September 30, 1912, is $1,268,493, the largest producers being Mexican, $414,682; Ophir, $356,241; Chollar Leasing Co., $197,942; Comstock-Phoenix, $157,144; Crown Point, $86,067; Yellow Jacket, $36,110; Con. Virginia, $7570; Belcher, $3212; and Hale & Norcross, $2417.

From the southwest drift of the Ophir 2400-ft. level, 82 tons of ore worth $48.55 per ton was taken. On the 1600-ft. level, the northeast drift from the north lateral of the Sutro tunnel is following the vein, which contains quartz of low value. The Mexican mill treated 552 tons of ore during the week ended March 1, worth $30.84 per ton, with 95% extraction. Work on the Monte Cristo and Keyes properties is being pushed ahead. The Ophir cyanide plant treated 609 tons of tailing during the week, and shipped 6 bars of bullion worth $5500.

White Pine County

The Nevada Consolidated Copper Co. produced 4,169,708 lb. of copper in January, against 6,309,228 lb. for the same month of 1912.

NEW MEXICO

Grant County

During the last quarter of 1912 the Chino mill treated an average of 4920 tons per day, containing 1.84% copper, the ratio of concentration being 15.14 tons of ore to 1 ton of concentrate, there being 29,891 tons of concentrate produced averaging 18.03% copper. The average extraction was 64.58%. Profits were $682,918, and for the whole year, $2,352,822.

Socorro County

Six mining companies in the Mogollon district are exceedingly active now in developing the gold mines. Three of these companies are producing, the Ernestine, the Socorro, and the Deadwood. Their mills are all running at full capacity. The Ernestine company is adding new equipment to operate the mines and mill, installing a new 260-hp. De la Vergne engine and a large air-compressor, and repiping the mines with large air pipes. Many more machine drills will be put in use as soon as this equipment, which has been bought in El Paso, can be placed. This is the direct result of the change of ownership and management of the Ernestine company. The new management is doing everything possible to begin developing the mines on a large scale, and preparations are being made to begin sinking the main shaft. The company will also push all the principal headings in the lower works. It has been decided to put all development on contract work, beginning February 1. E. A. Wayne, the general manager, has always favored contract work in order to make greater progress in development. The mill will be equipped to double the present output. There is a scarcity of laborers and miners in the district.

OREGON

Grant County

The Canyon Mountain Mining Co. has purchased a 10-stamp mill which used to be working at one of the properties in the Virtue Flat district. The machinery will be shipped by way of Sumpter Valley and Canyon City to the property.

SOUTH DAKOTA

Lawrence County

(Special Correspondence.)—Mine Rescue Car No. 5 of the U. S. Bureau of Mines, in charge of O. U. Bradley, has just completed a two weeks' stay in the Black Hills, instructing the miners in the use of mine-rescue apparatus and in first-aid work. One week was spent at the Homestake and the balance of the time at the Trojan. At both places the miners evinced great interest in the work and proficient crews were organized.

Beginning with January, the monthly dividends of the Homestake have been at the rate of 65c. per share. For

MILL AT HOMESTAKE MINE.

a number of years previous they had been 50c. The increased rate is in a great measure accounted for by a lowering of operating costs through the construction of a hydro-electric plant on Spearfish river. Since the company has 218,400 shares of stock outstanding, the present dividend rate calls for a monthly disbursement of $141,960, an increase of $32,760. On February 27 the company paid taxes in Lawrence county to the amount of $107,000, the largest

amount ever paid by it. The increase is partly due to the acquisition of mining ground purchased last year.

Deadwood, February 28.

UTAH

Utah County

The Pacific Gold Mining & Milling Co., at American Fork, covered 220 ft. of development and 3950 cu. ft. of stoping by hand in 1912. A west cross-cut in the lower adit cut a 6-in. vein of zinc-lead ore, and prospects are good. Ore and concentrate shipped amounted to 209 tons, containing 214,019 lb. of lead and 3614 oz. of silver, with a little gold, copper, and zinc. The average price received was $39.04 per ton.

During 1912 the Dragon Consolidated Mining Co. covered 2998 ft. in development, producing 2188 tons of ore valued at $59,056, and 6695 tons of iron ore worth $19,151. The cash balance at December 31 was $27,942. On the 800-ft. level a drift is being driven south to cut the contact and develop the country south of the shaft. Diamond-drilling covered 700 ft. in the gulch below the main shaft to cut the contact.

CANADA

Ontario

Following are results of working the City of Cobalt Mining Co.'s property during the 15 months ended December 31, 1912:

Development, feet	5,319
To date, feet	17,287
Ore shipments, tons	259
Ore milled, tons	8,921
Total contents, ounces	442,754
Ore reserves, tons	37,343
Total contents, ounces	1,269,662
Cost per ton milled	$3.224
Cost per ounce	0.122

The main shaft is 339 ft. deep, and connections were made with the 331-ft. level, and considerable work was done on No. 12 and 14 veins below that level.

The Nipissing high-grade mill treated 115 tons of ore in January, and the refinery produced 271,643 oz. of bullion. The low-grade mill is treating about 180 tons per day, the January output being 140,000 oz. Where several branch veins join the main lode, the Meyer vein is 15 ft. wide.

The low-grade mill at the Nipissing mine is treating to full capacity. During the week ended February 22, ore shipments from Cobalt were 229 tons and bullion shipments 133,710 oz. The Trethewey mine produced 620,923 oz. of silver in 1912; and ore reserves are estimated as 31,172 tons. Gross receipts were $301,086, and net profits $127,834. During January, La Rose Consolidated Mines Co. produced 217,977 oz. of bullion worth $134,724. The net profit was $76,278; dividend paid, $375,000; and surplus is $1,602,181. The Goldfields, Ltd., of Larder Lake, will add 30 stamps to its mill, and bring the capacity to 500 tons per day. Everything at the mine is electrically driven, including a 12-drill air-compressor. The mill consists of jaw-crushers, stamps, and amalgamating tables. During 1912 the Cobalt-Lake Mining Co. produced 1,123,147 oz. of silver, of which the 20-stamp mill yielded 541,570 oz. from 23,410 tons of ore, at a cost of $1.83 per ton. Total earnings were $648,409, and profits $420,100, while the surplus is $425,948. Ore reserves are estimated at 52,036 tons containing 2,135,040 oz. of silver. The Dome mine at Porcupine is now operating its plant with power from the Northern Canada Light & Power Co., whose power-station is at Waiwaten Falls, on the Mattagami river. The Dome company uses 900 kw. per day. During the six weeks ended February 11, the Hollinger mill treated 9562 tons of ore worth $240,300. Forty stamps are now at work. In the mine, 34 machine-drills are working, and 482 men in all departments. North on the 300-ft. level, the vein is being driven on and the drift is under the richer ore showing in the upper levels. The net operating profit from July 1 to December 31 was $600,664, which was appropriated by three dividends, $270,000; written off plant, $106,223; off development, $122,639; and carried forward, $101,802. Gold in precipitate, slag, and solutions amounts to $62,498.

CHILE

During the first two weeks of February, No. 1 adit of the Braden Copper Co. was advanced 42 ft. in ore averaging 1.97% copper. The converter department was shut down, and copper production was 458,000 lb. In the old mill the extraction was 69.9% of which there was saved 75.5% by the Minerals Separation process.

MEXICO

Baja California

After being shut down for two years, the San Juan mine is again in operation. Ore is to be taken by boat to Guaymas, from the mine, north of Santa Rosalia, and then railed to El Paso smelter.

Guanajuato

During 1912 the Tajo de Dolores mine produced ₱627,380 from 63,083 tons of ore, which averages 252 gm. of silver and 2.57 gm. of gold per ton. Extraction varied from 85 to 87%, and profits were $105,500. The mill contains 40 stamps, and ore reserves are given as 57,000 tons.

Jalisco

The Amparo Mining Co., of the Etzatlan district, has paid a dividend of 3%, amounting to ₱160,000. The Santo Domingo Mining Co. of the Hostotipaquillo district has been reorganized, and a 50-ton mill will be erected. W. T. Henderson is in charge of the property.

Mexico

The El Oro mill treated 20,990 tons of ore and re-treated 16,030 tons of tailing in January, yielding $181,690. Working expenses were $100,730, and development $26,760, leaving a profit of $54,200. Railway profit was $7990. The 40-stamp mill of the Mexico Mines of El Oro treated 13,350 tons of ore, worth $138,150. Working expenses were $44,170, and development, $10,900, leaving a profit of $83,080.

Sinaloa

(Special Correspondence.)—An option for ₱200,000 was recently taken on the property of the West Coast company, at Santa Cruze de Alaya, in this state, by Luis Thamalen, Enrique Peña, and J. R. Rogers. Miners have been employed and the mill is running on good ore. Experiments with cyaniding have been satisfactory, and the plant will be changed to all-sliming, and a modern cyanide plant erected. The old dump of the West Coast company, which contains about 15 oz. silver per ton, will be re-crushed and cyanided. The above named people have also taken over the old Polo Blanco mine, and a boiler and pumps are being installed to pump out the mine. J. W. Himez is developing his property at San Lorenzo. Everything is quiet in the state of Sinaloa.

Culiacan, February 24.

Sonora

Damage to the Democrata smelter by fire has been repaired, and the new furnace is again in operation. Shipments of ore are being made from the Transvaal Mining Co.'s property, near Cumpas, to Douglas. The orebodies opened contain large quantities of ore, the Cobre Rico mine having 2,500,000 tons of 2% copper ore, and the Transvaal about 3,000,000 tons of concentrating ore. In the former, development has covered 16,400 ft., including diamond-drilling, and in the latter, 2000 ft., besides 10,000 ft. of drilling. The Ultima Chanza mine has been opened by 5000 ft. of work, and 50,000 tons of ore averaging 10% copper and 5 oz. of silver is ready for mining. The company's holding covers 2225 pertenencias. At the Cerro de Plata mine the lode has been prospected for 4300 ft. to a depth of 600 ft. There are about 75,000 tons of ore worth 4% copper on the dump. A 50-ton treatment plant is to be erected by the Penn-Sonora company near Encina, on the Southern Pacific of Mexico.

PERU

Electrical haulage has replaced mule traction in the Cerro de Pasco mines. The new hydro-electric power-station at Oroya is being constructed with all speed.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

GEORGE B. LEE is at Douglas.

T. T. READ is at Douglas, Arizona.

L. D. RICKETTS has gone to Cananea.

E. E. CARPENTER is down from Rochester.

NORMAN CARMICHAEL was at Globe recently.

CHARLES BUTTERS was in Tonopah this week.

STANLEY LANE is in Moscow on mining business.

GEORGE H. SCHIRD visited San Francisco this week.

J. W. BENNIE has returned to Clifton from Douglas.

S. H. PITKIN will be at Denver March 10 to 15 inclusive.

A. J. EVELAND has been visiting copper mines in Arizona.

LIONEL LINDSAY has left for a vacation trip through Japan.

R. E. SMITH is drilling placers near Nikolaievsk, East Siberia.

ALF WELHAVEN passed through San Francisco returning to Korea.

D. C. JACKLING will hereafter make his home in San Francisco.

WILL C. HIGGINS has been visiting San Francisco and has gone to Reno.

R. B. LAMB is now consulting engineer for the Peterson Lake Mining Company.

W. W. TAYLOR is now manager at the Kainei mine, Kinsen station, Kei Fu Tetsudo, Chosen.

C. E. BARR succeeded S. J. Kidder as mill superintendent for the Silver Peak G. M. Company.

R. B. MARTIN will sail on the *Siberia* March 29 for Manila, to assume a position with the Bureau of Science.

ROSS B. HOFFMANN is in the Odeel region on the Lower Amur, East Siberia, but is expected in London soon.

W. A. KUNKLE has resigned as superintendent at the Ajax mill and gone to Denver to engage in consulting practice.

C. T. GRISWOLD has resigned from the Carnegie Institute of Technology to join the Associated Geological Engineers.

B. BRITTON GOTTSBERGER has been in the hospital for appendicitis. Two operations were necessary, but his recovery is now assured.

J. B. HUTCHINS, who has just returned to St. Petersburg after a trip to London, is now consulting engineer to the Cabinet of the Tsar of Russia.

KARL EILERS addressed the San Francisco Engineers' Club briefly last Tuesday on the affairs of the American Institute of Mining Engineers.

J. S. WILBUR and J. F. HANCHER, who are developing a drift mine in Colombia, expect to be in San Francisco in June to purchase equipment and supplies.

FRANCIS A. THOMSON has returned to Pullman, Washington, from an inspection of the Silver Hoard mine at Ainsworth, British Columbia, for which company he is consulting engineer.

ROBERT ANDERSON has resigned from the U. S. Geological Survey to form a partnership with A. C. VEATCH, specializing in the geology of petroleum. The new firm will maintain offices in London.

HALLET R. ROBBINS, recently of Atlantic, Wyoming, has been appointed assistant professor of metallurgy at the State College of Washington, Pullman, Washington, succeeding the late R. E. SAMPSON.

CHARLES A. BANKS, general manager of the Jewel Denero and Idaho Alamo mines, leaves New York March 1 by the *Carmania* for London. He intends returning to British Columbia about the middle of April.

J. F. THORN has resigned as general superintendent for the Goldfield Consolidated Mines Co., and ALBERT BURCH has taken charge of the property. It is understood that Mr. Burch will devote but part of his time to the work.

Spelter Production in 1912

The accompanying tables summarize the spelter production of the United States in 1912 and are from figures collected by C. E. Siebenthal of the United States Geological Survey. The figures are based upon direct returns from the smelting companies. They show an increase of 8.6% in the world's production, but a growth of 18.2% in the United States production and 21.5% in United States consumption. As noted at the time, spelter was imported during part of the year. Zinc ore imports for the year amounts to 43,940 tons containing 17,567 tons of zinc. Ore exports were 23,349 tons. In the review number of the *Mining and Scientific Press*, issued January 4, Mr. Siebenthal's preliminary estimate of 338,630 tons was printed. As will be seen, this is checked with remarkable accuracy by his final figures, 338,806 tons, now printed. The total number of retorts available at the close of 1912 was 107,948, of which 25,148 was in Illinois, 29,612 in Kansas, 27,416 in Oklahoma, 5772 in Pennsylvania, 15,408 in West Virginia, 2672 in Missouri, and 1920 in Colorado. New retorts to a total of 12,216 were building, and of these 11,640 were to be in Illinois. These figures illustrate strikingly the continued movement of the zinc-smelting industry to the coalfields.

MINING CONCESSIONS in Syria are being actively developed and the British Consul at Damascus states that a small company has been formed locally to procure mining concessions, and has five or six projects in hand, including prospecting for petroleum in the Yarmuk valley about 118 miles from Damascus by rail on the Haifa line, and also in the Ghor el Arbian vale, which is nearer, and at Kafranlye, and for iron in the district of Salt and near that town. In the vicinity of the Dead Sea it is proposed to prospect for iodine, bromine, asphalt, and bitumen. As to the coal or lignite at Erni on Mount Hermon, no mining is now going on, but a concession for the term of 99 years has been applied for.

THE most extensive and important of the Brazilian iron deposits are in the Serra do Espinhaço, bounding the valley of the river San Francisco on the east. The iron ore, oddly enough, also contains gold, and many gold mines are in the vicinity. Iron ore was first found as early as the sixteenth century. The Portuguese government attached so much importance to the discovery that special efforts were made to encourage a local industry, and officials and craftsmen were sent.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

STAMPS on the Rand total 10,006, and tube-mills 286, the average proportion being 1 tube-mill to 35 stamps.

ASBESTOS produced in California in 1912 amounted to 90 tons, worth $2700, against 125 tons, valued at $500, in 1911.

RECOVERIES of metals at the Sulphide Corporation's central mill at Broken Hill are: lead, 93.1%; silver, 92.9%; and zinc, 89.9 per cent.

THE Premier Diamond Mining Co., Ltd., has treated 54,872,296 loads of 1600 lb. each to date, which yielded 14,347,721 carats, worth $60,590,400.

BAUXITE, the ore from which metallic aluminum is derived, exists in southern California, but is not being mined. The principal American output is now from Arkansas.

ANTIMONY is found in Inyo, Kern, Merced, Riverside, and San Benito counties of California, but no actual production of ore has been mined for antimony alone since 1901.

IRON ORE production of California in 1912 was 2508 tons, valued at $1 per ton, against 1950 tons in 1911. There are large bodies of iron ore, especially in the southern part of the state, but little is mined.

HEAD-FRAMES at the nine principal mines at Kalgoorlie vary in height from 60 to 110 ft., spread at the base from 31 to 54 ft., at the crown from 10 to 14 ft., and have sheaves from 7 to 10 ft. diameter.

POWER COSTS at the Associated mine, Kalgoorlie, are 80c. per ton; mine development costs, $17.36 per foot; diamond-drilling, $3.12 per foot; mining, $2.16 per ton; treatment, $2.70 per ton; and extraction, 94.29 per cent.

CYANAMIDE is being used for agricultural purposes, and Swedish works are producing 3500 tons per month. Nitrogen compounds are made from the atmosphere in Norway, and in 1912 50,000 tons of calcium nitrate was manufactured.

DIES which have been concreted in mortar-boxes have given great satisfaction in that they are held solidly in place and the wear is more even than when they are secured in the ordinary way. It is also found easier to clean out the boxes when necessary.

FLOTATION of tailing at Broken Hill in December, at the Zinc Corporation plant, returned 5675 tons of zinc concentrate from 21,270 tons treated; and at the Amalgamated Zinc (De Bavay's) plant, 16,361 tons of 49.2% zinc concentrate from 59,299 tons of mixed tailing.

CALCIUM CARBIDE production in Europe during 1912 amounted to 200,000 tons. There are 75 companies engaged in the business, but their factories did not work to full capacity. German consumption increased by 12,000 tons, and 46,000 tons was imported from Switzerland, Norway, and Sweden.

LIQUID AIR contains two parts of oxygen to one part of nitrogen, whereas ordinary air contains approximately four parts of nitrogen to one part of oxygen. Atmospheric air liquefies at a temperature of −191°C., and is reduced to about 1/700 to 1/800 of its original volume; consequently, one gallon of liquid air will evaporate into 700 to 800 gal. (110 to 130 cu. ft.) of atmospheric air.

SHAFT-SINKING costs at Kalgoorlie vary from $47.06 to $59.22 per foot for box-timbered shafts (exclusive of cutting stations at the various levels), and from $61.88 to $80.76 per foot for frame-timbered shafts, while the average cost for mine shafts from 4 by 10 ft. to 5.5 by 13.5 ft., inside measurement, was $60.32 per foot. The latter item was made up as follows: Wages and salaries, $34.76; timber, $8.42; explosives, $3.86; stores, $2.26; power, $11.02.

WIRE ROPES for hoisting purposes in Western Australia vary in size from 2¾ to 4¼ in. diam. The government regulations state that the working load shall not exceed one-eighth of the certified breaking strain of the rope when new, and whenever after testing, as provided by regulations, it is found that the breaking strain of any rope is not 6 times at least greater than the working load, such rope shall be condemned by the inspector of mines.

OXYGEN for mine-rescue apparatus may be generated from sodium-potassium peroxide by passing an aqueous vapor and carbonic acid (both products of respiration) according to the following reactions:

$$NaKO_3 + H_2O = NaOH + KOH + O_2$$
$$NaKO_3 + CO_2 = NaKO_3 + O_2$$
$$CO_2 + NaOH + KOH = NaKCO_3 + H_2O$$

The products of respiration, CO_2 and H_2O, are absorbed, and the O is restored to the wearer of the apparatus.

LOCATIONS cannot lawfully be made or perfected to patent for purposes or uses foreign to those of mining or the development of mineral. Formerly many locations were made to hold ground containing springs, or good for grazing, power-sites, timber, etc. Under the present rigid field examination before approving the entry for patent, such 'bluff' locations cannot be patented, though they remain as locations until the interests of public policy or the protest of some one with a better right to the land causes their removal.

OXIDIZED zinc ores of Leadville were first shipped in 1910. They are found, according to *Economic Geology*, within an area of 10 square miles, in 'blue limestone,' from the 'parting quartzite' up to the 'white porphyry.' The ore-bodies are as irregular as other replacement bodies of the district. The valuable portion of the ore consists of smithsonite (carbonate of zinc), calamine (hydrated silicate of zinc), and hydrozincite (hydrated carbonate of zinc), the first predominating over the others in most cases, and the last is rarely identifiable. In connection with the search for oxidized zinc ores, a new mineral and new variety of previously classified species were discovered. The first is an oxide of manganese and zinc, and the second is an aragonite containing variable proportions of zinc, up to 10%. They have been named by G. M. Butler as wolframite and nicholsonite. The zinc ores have the following composition:

Specific gravity...2.7 to 4.0			Per cent.
	Per cent.	Iron	2.2 to 17.0
Zinc .....17.7 to 46.4		Sulphur	0.6
Lime ..... 0.3 to 0.9		Alumina	0.2 to 2.8
Magnesia ..... 0.7 to 2.2		Manganese	2.0 to 11.2
Silica ..... 0.9 to 33.6		Insoluble	2.2 to 34.6

LANDS withdrawn for power-sites and reservoirs were formerly invariably closed to location, especially where locations might interfere with the purposes of the withdrawal. Though the Land Department said that a location made prior to the withdrawal would be upheld, if a valid one, that is, founded on actual discovery by the locator of a valuable deposit of mineral within the limits of the claim, and maintained in accordance with the mining laws and regulations applicable, it also said that the withdrawal of land for irrigation or reclamation projects did not withdraw it from mineral location. In general, it was considered that the miner making a location on a withdrawn area was entitled to a preferred right to make a valid location upon the removal of the withdrawal, if no greater right. Locations have been made on this principle upon Indian and military reservations, but it is a poor method to pursue, for the authorities are usually antagonized by the trespassing of the locator. However, the land-withdrawal law passed by Congress June 25, 1910, now permits mineral locations upon withdrawn areas and clearly defines the present rights.

Book Reviews

Any of the books noticed in these columns are for sale by, or can be procured from, the MINING AND SCIENTIFIC PRESS.

DE RE METALLICA. By Georgius Agricola. Translated from the first Latin edition of 1556 by Herbert C. Hoover and Lou H. Hoover, and published for the translators by *The Mining Magazine*, London, 1912. For sale by the *Mining and Scientific Press*. Price $8 post and duty paid.

This handsome vellum-bound folio of 640 pages, appropriately illustrated by reproductions of the wood-cuts used in the original edition, presents in sumptuous format the first English translation of the great classic of mining. If it were a literal translation it might be dismissed as interesting but unimportant; a fit addition to the libraries of those who value books in direct proportion to their rarity. The work, however, that Mr. and Mrs. Hoover have literally given the mining profession, is much more than a translation. It includes in sequence, a Translators' Preface; an Introduction, which is a biography of Agricola; a reproduction of the original Latin title page, and the laudatory lines of Georgius Fabricius, Agricola's learned friend; a translation of the original preface; translations of the twelve books of the original work; Appendix A, a bibliography and review of Agricola's other works; Appendix B, a resumè of the notes on mining, metallurgy, and mineralogy found in earlier works and available to Agricola at the time he wrote; Appendix C, tables of Greek, Roman, and old German weights and measures such as were currently used when Agricola wrote; and lastly a well planned and discriminating index. This mere relation of the contents will indicate in outline something of the care and work that have gone into the new volume.

Any comparison that may be made of this with earlier translations into German, such as have been heretofore available, and a record of the various attempts previously made to translate into English, will give an even better understanding of the nature of the difficulties that had to be overcome. Mr. and Mrs. Hoover are by no means the first who have proposed to translate the volume into the tongue used by those who are preëminently the mine owners and mine workers of the present day. As early as 1636, Sir John Pettus made the attempt, but apparently nothing came of it. As late as 1903 a group of men at Butte, a centre of research as well as of profitable mining, started in ambitiously, but later gave up the task. It chances that the Latin of the first chapter of Agricola's work is relatively easy; indeed that is probably the easiest chapter in the whole volume to translate. It has in it less that is technical, and deals, broadly, with the utility of mining. It was necessary in the sixteenth century to use labored argument to prove that mining was a right and proper vocation; that the "earth does not conceal metals in her depths because she does not wish that men should dig them out, but because provident and sagacious Nature has appointed for each thing its place." In the discussion of such problems there is a broad human interest; but there are relatively few puzzling problems, such as how to translate into modern English technical terms made up in the middle ages by compounding Greek and Latin words, when the Greeks and Romans did not themselves have the concepts for which the words were needed. It is an open secret that Mr. and Mrs. Hoover began the translation as light heartedly as any of their predecessors. Fortunately they did not drop the matter when subsequent chapters showed the real difficulties of the task. It is in just this difficulty of right rendering of technical words that the new volume is unique. Agricola, writing in Latin of an art that had grown up after the Latin language had been cast and the mold broken, had to make words. There having been no concept, there was naturally, in the language used, no word to express it.

The same difficulty, as to words, was faced by Quannah Parker, the great Commanche chief who introduced hogs on the plains previously sacred to cattle. His tribesmen came miles to see the new and strange creatures, and asked the chief by what name they were known. The word hog would have meant nothing to them, but through traders the Indians had come to have clear concepts of hams and bacon, so Quannah Parker told them that the new animals were hams and bacon. At this, one of the old men turned away in disgust, remarking: "Injun no like 'em. Too heap much salty." Agricola had to find terms for new ideas, and in former translations there has been little left but the salt.

Mr. Hoover, with his first-hand knowledge of mining and his thorough scholarship, has been able to make Agricola's terms intelligible without unduly reading into them ideas that have originated since. To do this required wide reading in earlier and contemporary writings. It was necessary to get the point of view before the work could be successfully attempted. It is not surprising therefore to know that preparation of this book has taken all the spare time of the two translators, with much assistance from others, through five years.

As a concrete definite picture of mining as it was known and practised in the sixteenth century, this book is important to all engineers; as an intellectual cross-section of the Middle Ages, however, it has much wider interest. Reading it, in the light of the copious and scholarly footnotes found in this translation, gives us real knowledge of how our predecessors thought and felt about one of the great basal industries and one of the great domains of human knowledge. Just as a sojourn in the interior of even modernized Japan enables us to orient our knowledge of feudalism, this book affords a convenient and fascinating approach to the Middle Ages. Modern men are more interested in business and social life than in wars and royal successions, the two things that medaeval writers thought most worthy of presentation on the pages of history. Agricola painted his own times well, and Mr. and Mrs. Hoover have restored the masterpiece with rare skill.

All mining engineers know something of George Bauer, to use the real name of the author of 'De Re Metallica,' but we venture to say that few have appreciated the greatness of this our professional ancestor. A writer, student, and court physician he was, but also a Burgomaster, a diplomat, a trusted public servant, and an associate of the great men of his times. It is especially interesting to find that Bauer, a loyal and devoted Catholic, retained the confidence and esteem of his Prince and Protestant associates in Meissen through the long and bitter wars that grew out of the religious difficulties of the times. Holding sturdily to his old faith, he was the recognized intellectual peer of the greatest among his contemporaries, and when bitterness too commonly had supplanted friendships, Melanchthon, Camerarius, Fabricius, Erasmus, and others, were his close associates.

Our author was a man of affairs who contributed his part to the making of his times. He was also a lifelong student, and he wrote a number of books besides the one on which his fame chiefly rests. One of them in particular, 'Ortu et Causis,' Mr. Hoover considers valuable and significant. In it he gave in detail his views of the genesis of ore deposits summarized in Book III of the 'De Re Metallica.' We printed, October 5, elaborate comment on this chapter, prepared by Mr. and Mrs. Hoover and presenting the seventeenth century theory of ore deposition. As so often happens in careful analysis of old works, there were the germs of surprisingly modern doctrine in what Agricola wrote, not only about ore deposits, but about metallurgy and mining. This, and the bearing of much of what he said is made clear by the comment of the translators, and it is in this comment which will prove of most interest and value to Mr. Hoover's professional contemporaries. It is difficult to give an adequate conception of the wealth of material that is compressed in these footnotes and of the difficulties that had to be met in preparing them. Not only libraries but museums were ransacked. Analyses and assays were made of precious fragments to determine just how much of metallurgy was practised when the vases and coins were made. Such study was only possible where modern technical knowledge and deep scholarship were both available. It was in the truest sense a labor of love, and aside from the value of the work itself,

the profession will be stimulated and benefited by the example of this work undertaken to "strengthen the traditions of one of the most important and least recognized of the world's professions." For our part, we take great pleasure in our modest connection with the enterprise through the work of our affiliated publication. H. F. B.

THE STOCK EXCHANGE FROM WITHIN. By William C. Van Antwerp. Pp. 459, ill., Index. Doubleday, Page & Co., New York, 1913.

Securities in America alone aggregate the enormous total of $43,000,000,000, and it will not be disputed that where 2,000,000 people own one-third of the nation's wealth, they are entitled, just as the farmer is, to a perfectly constructed price-making machinery which will enable them to invest their savings, or sell their holdings. In the why and wherefore of the Stock Exchange, the author makes these remarks; while he quotes from W. Lexis, of Gottingen, a well known economist, as follows: "The existence of a broad, continuous market is an economic necessity in the modern scheme of widespread investment of capital. Even though the market-place is largely filled with speculators, it is plain that the greater the number of trades in securities, the greater will be the facility for buying and selling any quantity of securities. The stock market is a powerful aid in floating new issues of public securities * * * it renders a useful service in giving a continuous guide to the success or failure of industrial undertakings * * * private investors receive in this way a continuous market opinion on the conditions of the corporations in which they are shareholders." Many persons question the necessity of the Stock Exchange, but if the matter be studied, its functions will soon become apparent. The Exchange, without doubt, leads to a lot of abuses, of which the writer is fully aware, and wild speculation will always occur, while the investor looks for a steady return on his securities, irrespective of large sums to be made from booming, which, at its best, lasts but a short time. In Stock Exchange deals we have 'bears' and 'bulls,' whose functions are well appreciated, but the practice of 'short selling,' that is, selling what one does not possess, is not so well understood, and this is fully explained. It has been often questioned as not being the square thing, but the writer thinks otherwise. At any rate, money is made in this manner. The relation between banks and the Stock Exchange is a close one, the former had holdings amounting to $4,450,822,522, deposited by 10,009,804 people at October 30, 1912; and some outlet is necessary for such sums for investment. This is afforded by the Stock Exchange. Discussing panics, and that of 1907, it is stated that every business depression in the United States has been discounted in our security markets from six months to two years before. From August 1905 to August 1907, New York City bank loans secured by Stock Exchange collateral declined from $385,652,014 to $251,867,158, a corrective force of $133,784,856. The Exchange is a barometer of future business conditions, and men turn to it for first aid at such times. The New York and London stock exchanges, and the Paris bourse are compared in an interesting way, and in the matter of settlements the first named has a good system. New York lists 1583 and London 9000 securities; while the total holdings of these exchanges are valued at $26,243,291,803, over £10,200,000,000, and over 155,000,000,000 francs. The 'Money Trust' investigation, which has recently brought out interesting details of the financial world, will be better understood on reading this interesting volume. An appendix contains a report of the Hughes Commission, and Stock Exchange laws; while an excellent index enables the reader to search for details of financial discussion. M. V. B.

ELEMENTS OF HEAT-POWER ENGINEERING. By C. F. Hirshfeld and Wm. N. Barnard. 792 pp., index. John Wiley & Sons, New York. For sale by the *Mining and Scientific Press*, San Francisco. Price $5.

The authors have done excellent work in including under one cover not only the elementary thermodynamic theory of gases and their cycles, but also the consideration of the sources of heat, its utilization in the various types of prime-movers and auxiliaries to which it is applicable, together with a discussion of the fundamental theory, the ideal and actual performance of the apparatus under working conditions. The text has been prepared primarily for advanced students in engineering who have had previous training in physics, chemistry, analytical and applied mechanics, and empirical machine design. The arrangement of the text is excellent, the various subdivisions under which the subject has been considered being treated in their logical sequence. No attempt has been made to expound new theories, emphasis being placed instead on fundamental laws and accepted theories. The derivations as well as the formulæ themselves are given in full; an essential to a thorough understanding of any subject which is frequently overlooked by writers on scientific subjects. The steam-engine and its performance is discussed at length, from the simplest forms of slide-valve reciprocating engines to the highest types of steam turbines. Boilers, economizers, and other steam-utilization auxiliaries, as well as the various kinds of fuel in use, are treated at length. Consideration given to internal-combustion engines is no less thorough. In this case, as in that of steam-engines, all types are considered, from the single-cylinder 4-cycle gasoline-engine to the oil and suction gas-producer and Diesel types. Water purification, complete power-plants, compressed air, and refrigeration are all subjects of chapters; in fact, the impression given by this book as a whole is that a big subject has been treated comprehensively and at the same time is condensed within a comparatively small compass. Engineers engaged in the practice of this branch of the profession will appreciate its value as a book of reference, while students will find their studies greatly simplified through a careful perusal of its pages. C. T. H.

THE MINING MANUAL AND MINING YEAR BOOK, 1913. By Walter R. Skinner. Pp. 1354, index. W. R. Skinner, London, E. C. For sale by the *Mining and Scientific Press*. Price $5.25.

The union of the 'Mining Manual,' established in 1887, and the 'Mining Year Book,' founded in 1901, has been effected, and the combined work is now published under the above title. This is a good plan, as the publication of two similar volumes on the mining industry was quite unnecessary, and caused a good deal of comment at such waste of divided labor. The book is now classified into two sections, namely, 'African' and 'Miscellaneous,' and many mines whose shares are not dealt in on the London Stock Exchange are included in the latter section. A work of this nature has so often been reviewed, its valuable information so well known and well received, that little further can be said about it. It is creditable that such a large volume, covering the operations of so many companies, can be published so early in the year, and containing results as far as possible up to the end of 1912. Mr. Skinner, in the preface, covers a short review of work at the different mining fields, not forgetting the sensation in the Nigerian tin section, which was given in detail in *The Mining Magazine* during the past year. A directory of mining directors covers 216 pages; of mining secretaries, 49 pages; of mining and consulting engineers and managers, 36 pages; glossary of mining terms, 8 pages; while the index refers to no less than 5350 companies.

BUILDING STONES AND CLAY PRODUCTS; A HANDBOOK FOR ARCHITECTS. By Heinrich Ries. Pp. 415, ill., index. John Wiley & Sons, New York, 1912. For sale by the *Mining and Scientific Press*. Price $3.

There is an extensive literature of building stones and clay products, but as most of it consists of government reports or chapters in such reports, it is not readily accessible. The best general summary of the subject has been Merrill's well known volume. The handbook prepared by Mr. Ries is at once more comprehensive, in that it covers clay products as well as stone, and less detailed. The material used has been well chosen and is excellently presented. Bringing into one modest-sized volume so much that the architect needs, leaves no further excuse for mistakes that have been all too common.

COSTS OF PRODUCING POWER IN IOWA WITH IOWA COALS. By H. W. Wagner. P. 35. Charts. Bulletin No. 29, Engineering Experiment Station of Iowa State College of Agriculture and Mechanical Arts. Ames, December 1912.

CONTRIBUTIONS TO ECONOMIC GEOLOGY, 1910. (Short papers and preliminary reports.) Part II, MINERAL FUELS. By Marius R. Campbell and others. Bull. 471. P. 663. Maps, charts, index. U. S. Geol. Survey, Washington, 1912.

THE TANANA MAGAZINE. 'Quartz' edition of *Fairbanks Daily Times*. P. 76. Ill. Fairbanks, Alaska, 1912. An interesting little publication dealing with the lode mines of the district, where there are now 16 stamp-mills in operation.

PHYSIOGRAPHY AND STRUCTURE OF THE WESTERN EL PASO RANGE, AND THE SOUTHERN SIERRA NEVADA. By Charles Laurence Baker. Bulletin of the Department of Geology, Vol. 7, No. 6. P. 25. Ill. University of California, Berkeley, December 1912.

COAL DEPOSITS OF MISSOURI. By Henry Hinds. Bureau Geology and Mines, XI. N. S. P. 503. Ill., index, maps. Prepared in coöperation with the U. S. Geological Survey. An excellent general summary, bringing up to date the knowledge of important Middle West fields.

UNDERGROUND WATER RESOURCES OF IOWA. By W. H. Norton, W. S. Hendrixson, H. E. Simpson, O. E. Meinzer, and others. Prepared in coöperation with the Iowa Geological Survey. Water-Supply Paper 293. P. 994. Maps, plans, index. U. S. Geol. Survey, Washington, 1912.

GEOLOGY OF KALGOORLIE, WESTERN AUSTRALIA. By C. O. G. Larcombe. P. 312. Ill., maps, plans. Vol. V, No. II, 1910. *Proceedings* of the Australian Institute of Mining Engineers. Melbourne, Victoria, 1911. This is a most important and valuable contribution to the geology of this well known field, and is the result of over three years observation by the author, who is instructor of mining and geology at the local School of Mines. Previous to the examination of the field by Mr. Larcombe, it was studied by H. P. Woodward, T. A. Rickard, A. Gibb-Maitland, E. F. Pittman, E. S. Simpson, C. S. Göczel, W. M. Frecheville, and J. M. Maclaren. Besides the geology of Kalgoorlie, that of Western Australia generally is reviewed, and the country adjacent to the former centre. The plans and micro-photographs are especially good and interesting.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

MINING CLAIMS—AWARD ON CONDEMNATION

Grantees of a portion of the surface of a mining claim from the original locator are entitled to a proportionate share of award of damages to the claim-owner, in a condemnation suit for a railroad right-of-way. The issuance of a patent to the locator subsequent to the grant aforesaid does not affect the grantees' rights because the patent relates back to the original location.

Las Vegas & T. R. Co. *v.* Summerfield (Nevada), 129 Pacific, 303. (Jan. 4, 1913.)

OIL LEASE—RIGHT TO CANCEL DENIED

Where a vendor sold some oil lands to a vendee on an instalment contract, reserving a vendor's lien to secure the unpaid part of the purchase price, and reserving also one-half the oil and gas, and thereafter the vendee executed an oil and gas lease on a royalty basis to third parties, the vendor, in the event of foreclosing his lien against the vendee and buying in the land at the foreclosure sale, must take title subject to the third party lease, where, by his conduct in not making the lessee a party to the foreclosure suit and requesting a receiver to sequester the rents he has impliedly at least ratified the lease.

Batten *v.* Hope Natural Gas Co. (West Virgina), 79 Southeastern, 889. December 17, 1912.

OIL AND GAS LEASE—FORFEITURE

An oil and gas lease required the lessee to commence operations within four months and pursue with diligence until completed, and that the lease should immediately upon the non-completion of said well be null and void. The lessee went into possession under the lease, sank one well, abandoned it, sank another well, abandoned it, and moved the drilling machinery away. No oil or gas was discovered in either well and no further prospecting was done until gas was discovered on adjacent land some time afterward, when the lessee set up a claim of right under the lease. Held that the lease was forfeited for non-completion of a well, it being the manifest intention of the parties that 'completion' of a well meant the discovery of oil or gas in commercial quantities.

Shannon *v.* Long (Alabama), 60 Southern, 273, November 19, 1912.

OIL PLACER—SUIT ON ADVERSE CLAIM

In a suit on an adverse claim filed in the course of patent proceedings, on an oil placer, it was held: (1) that where a discovery was sought to be made by drilling a well on the boundary line between two claims and it subsequently appeared that the boundary line had been erroneously established so that the well was not on the true boundary but outside of the claim in question, such a discovery cannot support a location of that claim; discovery must be within the claim limits; (2) while a discovery should properly precede the acts of location, it may follow, instead of precede such acts and will be held good as to all who have not acquired intervening rights; (3) mere indications of oil, however strong, are insufficient to constitute a discovery such as will support an original location, especially as the substance claimed to be oil by the applicant for patent was shown by the adverse claimant to be nothing more than shale grease; (4) an original and amended certificate of location must be construed together, and although neither certificate standing alone might be sufficient to support the location, both should be taken together, in the absence of intervening rights; (5) plaintiff's failure to prove the citizenship of the original locators does not entitle defendant to relief, the recorded certificate being of itself *prima facie* evidence that they were citizens, and no evidence having been introduced by defendant to the contrary.

Dean *v.* Omaha-Wyoming Oil Co. (Wyoming), 128 Pacific, 881. (Jan. 7, 1913.)

A New Lufkin Rule

Everyone having use for a rule graduated down to sixty-fourths of an inch, knows the difficulty of obtaining accurate measurements in laying out work, knows how impossible it is to get the reading instantly, knows of the eye-strain attendant upon reading such graduations repeatedly —all caused by the fineness of the lines and the closeness of the lines one to another necessary to get 64 lines in an inch. Under the eye the lines have a tendency to 'run together.' Also, because the lines are so close together, it is impossible to number each one, and therefore, after arriving at the measurement it is necessary to refer back to the last figure and count the divisions. It is evident that if the same measurement could be arrived at with the same degree of accuracy with a rule graduated down not finer than 16 lines to the inch these difficulties would be overcome. Both of these are solved in one way in the 'Alien' improved scale, an article just put on the market by the Lufkin Rule Co. The Allen scale is a patented article, and embodies a new idea in the marking of a machinist's scale.

As any even number of 64ths has an equivalent in 32nds, and possibly in 16ths, one side of this rule is graduated in 32nds and 16ths, and this takes care of all of the even 64ths. The other side of the rule embodies the new idea. It takes care of all the odd 64ths. The first graduation mark on one edge of this side is 1/64 in. from the end of the rule, and is numbered 1; the next mark on that edge is 5/64 in. from end of rule and is numbered 5; the next 9, the next 13, and so on up to the first inch mark, and thence being repeated in each inch. Here there is a jump each time of 4/64ths, and between 1/64th and 5/64ths would come one odd 64th, that is, the 3/64-in. mark; between 5 and 9, the 7/64-in. mark, etc. All of these odd 64ths appear on the other edge of this side of the rule; that is, the first graduation mark there is 3/64 in. from the end of rule, and is numbered 3; the next is 7/64 in., and is numbered 7. In this way all the odd 64ths are here given, and yet there are only 16 lines to the inch. This makes it possible to number each graduation mark, and by marking each second graduation mark slightly longer than the one before it and after it, the figures can be put on in two rows, and this allows room to make them large enough to be easily read. The rule is ¾ in. wide and furnished in the two thicknesses commonly known as the tempered and semi-flexible. It is made in various lengths. The greatest demand is expected to be for the 6-in. length. The Lufkin Rule Co. manufactures rules and measuring tapes of every description, being the largest manufacturer in its line. Its factories are at Saginaw, Michigan, and Windsor, Canada; branch offices and warehouses at New York City, and London, England.

Transformers for Outdoor Installation

For many years small lighting transformers of comparatively low potential have been installed out of doors, and they have satisfactorily withstood the service. No effort was made to develop a type of high-tension power transformers for outdoor service, owing to the demands for power being confined to centres of population where the power stations and substations were situated. Recently, however, owing to the fact that it is often desirable to tap a high-tension line where the load is not sufficiently great to justify building a sub-station, high-tension transformers of all capacities and for any commercial voltage have been designed for outdoor service.

Power transformers, 100 to 500 kva., for distributing potentials, 2300 to 6000 volts, and all transformers above 6000 volts and up to 500 kva., as built by the General Electric Co., employ a different type of construction than the distributing transformers used in city distribution. In these transformers, the straight two-legged core type construction is employed. The core consists of two vertical legs connected together at the top and bottom by yokes, thus forming a rectangle. Cylindrical coils and insulation cylinders are placed concentrically over the two vertical legs of the core, the high-voltage winding being outside the low-voltage winding, and separated therefrom by oil-ducts, and the above mentioned insulating cylinders. Power transformers for all voltages may be self-cooled or water-cooled.

In self-cooled transformers, the heat arising from the losses in the transformer is dissipated into the surrounding air, by providing a tank with sufficient external radiating surface to limit the temperature inside the transformer to a safe value. The tanks for these transformers are made from sheets of steel, corrugated under great pressure and electrically welded together. A base and rim are cast directly to the corrugations, the joint between them being an actual weld. This forms a rigid one-piece tank which, when supplied with a suitable cover and gasket, is readily adapted for outdoor operation. The main difficulty, however, in designing high-voltage transformers for outdoor use, is encountered in bringing the leads out of the tank. In transformers below 17,500 volts this is easily accomplished by bringing them out through porcelain bushings set in, or underneath, the rim around the top of the tank.

For potentials above 17,500 volts, this method is unsafe, so the leads are brought straight out through openings in the cover, and protected from the weather by a porcelain covering, built up of several petticoats. In water-cooled transformers, the heat generated by the losses in the transformer is artificially extracted from the oil by circulating cold water through a seamless coil of pipe placed in the upper part of the tank and submerged in oil. The expensive corrugated tanks for radiating the heat are, therefore, unnecessary, as a plain steel plate tank is provided. Transformers in these tanks are suitable for outdoor operation when equipped with porcelain petticoat leads brought out through metal bushing holders. Transformers having a capacity greater than 500 kva. are built of the shell type, that is, the core surrounds the windings, which is in direct contrast to the core type, where the windings surround the core.

Self-cooled shell type transformers are not built in capacities much above 3000 kva., because of the large and expensive tank construction necessary to obtain radiating surface. The extra radiating surface necessary for self-cooled transformers above 750 kva. is obtained by compounding the corrugations, that is, two plain corrugated sheets are welded together to form one large corrugation. This tank has about 65% more radiating surface than the plain corrugated tank. Another type of tank for large capacity self-cooled transformers is known as the 'tubular' or 'pipe' tank. This consists of a boiler plate tank having the ends of a double row of vertical steel tubes welded into it at the top and bottom, this providing a natural circulation for the hot oil from the top to the bottom of the tank through these external pipes, where the heat is quickly dissipated. These tanks are very efficient.

The majority of transformers above 1000 or 1500 kva. are water-cooled. The tanks for water-cooled transformers are made from heavy boiler plate, being round for single-phase transformers, and elliptical for three-phase units. They are perfectly plain and smooth, having no corrugations or pipes, which are unnecessary in this type of transformer. All these various tanks are designed for outdoor use when furnished with a suitable cover, gasket, and leads. Three large water-cooled transformers, 2750 kva. each, have recently been designed for outdoor operation on a 110,000-volt circuit. These are in successful operation at the present time. Some 1000 kva. self-cooled transformers, in tubular tanks, are also in successful operation cut down on a 110,000-volt circuit.

At the annual meeting of the Manufacturers' Bureau of Indiana, Melville W. Mix was unanimously reëlected president for the fourth time. Mr. Mix is president of the Dodge Manufacturing Co., extensive manufacturers of power-transmission machinery, Mishawaka, Indiana, and well known in the industrial world. The Manufacturers' Bureau includes several hundred Indiana manufacturers.

PUMPING coal sounds anomalous, but Mr. R. G. Hall tells on another page how he applied centrifugal pumps to moving fine coal into and out of water storage. His success goes a long way toward solving the problem of storage of fine coal; a problem that is severe in the Middle West and again on the Pacific Coast.

CONCENTRATION is but a form of sorting in which machinery and water are substituted for the trained eye and hand of the worker. It is natural that each should have its field of maximum efficiency, and just where to draw the line is often a real problem. Mr. R. S. Handy tells this week how a decision was reached at one plant, and the method is applicable elsewhere. Written for our readers, Mr. Handy's paper was one of the interesting series read before the recent meeting of the Spokane local section of the American Institute of Mining Engineers.

ONE blast-furnace of a group of three built by the Penhsihu Colliery & Mining Company, in southeastern Manchuria, was recently blown in. The company was formed several years ago with joint Japanese and Chinese capital, to work promising coal and iron mines a short distance southeast of Mukden, and the coal mines have been in successful operation for some time. Iron ore of high quality has been developed in considerable supply, and it is planned to make an annual output of 120,000 tons of pig. The work is of especial interest since it is the first of the kind to be started by private enterprise throughout the whole of China.

DYNAMITE is a good servant, but demands careful treatment. Destruction of the steamer loading at Baltimore, of Nobel's works at Glasgow, and of the storehouse of the Utah Copper Company at Bingham, all within a week, focuses attention on one danger ever present in our industries. In all these cases there is no reason to believe the destruction was malicious. In that of dredge No. 1 of the Yukon Gold Company, blown up February 24, while the motive is obscure, the explosion can hardly be accepted as accidental. Officers of the company are entirely unable to account for the motives back of the act. There had been no labor troubles or other disagreements that might offer an incentive, and the company is not unpopular locally. Canadian officials are active in the search for the perpetrators of the crime and their efficiency is so well known as to lead to every expectation that the dynamiter will be arrested and punished. We often wish

detection was as certain on our side of the boundary. We are glad to know that relatively little damage resulted from the explosion and that No. 1 will be ready for operations this spring with the rest of the fleet.

SISKIYOU county lies on the northern border of California. It is as large as a number of European states, and much of it is unsettled. Roughly, one-third lies in the National Forests, another third belongs to the railroad and is not open to prospectors, and only the remaining third is private or public land open to use without restriction. The county has been fortunate in its settlers and has an unique record in several particulars. For example, it not only has no debt, a sufficiently unusual detail to excite comment, but has a surplus in its treasury. Incidentally, the area is one of rich gold veins and important copper deposits are being developed. The county levies a tax, which yields about $7500 per year, to create a fund for purchase and display of the best specimens of gold and other minerals found in its mines, and in this way it is endeavoring to attract additional citizens by presenting concrete evidence of the wealth to be won. This work is in the hands of a citizens' committee consisting of Messrs. C. L. Proebstal, R. E. DeWitt, L. A. Lash, and Fred Wadsworth, and it is producing results. One who has enjoyed camping in the mountains and valleys of Siskiyou can wish no emigrant a kindlier fate than that he find a home among them.

Mining Bills at Sacramento

Mining men in California should study the bills relating to the industry now before the legislature at Sacramento. The Mines and Mining Committee of the Assembly will hold a public hearing Monday afternoon, March 17, to consider the Finnegan bill for a mine inspection service. This is one of three directed to the same end, that has been introduced. The Birdsall bill, Senate 254, proposes to abolish the State Mining Bureau and substitute a mine inspection service. Aside from any question as to the wisdom of this policy, it is poorly drawn, contains numerous mischievous provisions and should be defeated. The Campbell bill, Senate 930, is much better, and, in our judgment, the best of the three. We are already on record as favoring the passage of a mine inspection law. We believe that a competent inspector would prove a useful adjunct to mining in the state, and that the operators make a mistake in offering no constructive criticism to the bills that come up from year to year. In outline, the Campbell bill is excellent, and it could well be made the basis of a highly useful law. In numerous other bills there are proposals of vital interest to miners. The Stuckenbruck Assembly bill 461, proposes to extend to mining companies the right to condemn and purchase land for storage of tailing; the Caminetti Senate bill No. 1607, requires telephone systems in mines; the Campbell Senate bill No. 931 and several others, provides for an eight-hour day in mines, mills, and smelters; the Finnegan Assembly bill No. 1306, provides for a water spray with all machine drills, and otherwise regulates ventilation; the Stuckenbruck Assembly bill No. 703, proposes a poorly chosen board to regulate smelter-fume matters, and numerous other proposals for legislation have been made. A little would be useful, but most of it may fairly be classed as freak legislation.

'Blue Sky' Legislation and Investors

That a fool and his money are soon parted is a truism discovered many years ago. It is also one likely to be received as axiomatic for many generations to come. It is too much to hope that society can protect from financial loss those who are incompetent or too lazy to use ordinary precautions to protect themselves. It is distinctly worth while, however, to throw every safeguard around the savings of the average man. It is to these accumulations from the many that industry must look for capital for expansion. The very rich, of whom so much is written, are usually rich less in what they actually own than in the funds they control. The case of Edwin Hawley is to the point. The dominator of numerous important railways, hailed at one time as the probable successor of E. H. Harriman, and at the time of his death engaged in building up an independent railway system that would have extended from Newport News to Minneapolis, his estate was only about five million dollars. The great railway and industrial enterprises of the world are today supported by the savings of wage-earners and professional men, and the most serious sign of the times, industrially, is the growing disposition of the average man to spend rather than to save. If business is to expand in any country, there must be a stream of investment running counter to the outflow of money in wages and salaries. Lately the tendency has been strong both in the United States and Europe, for each to spend his surplus in luxury and pleasure rather than to return it to industry with a view to increasing his margin of safety. We believe this to be due to widespread belief that the old machinery for investment of savings did not yield a fair return to the one who did the saving. The decreased purchasing power of money at once increased the difficulty of saving, and lessened the return that could be expected from reinvestment. At the same time the growth in the very large fortunes decreased the apparent value of a modest competence. Many a man of family has reasoned that even if he should save as much as $100,000, his standing and position in the community would be little improved, the safe income he could leave his family would be but $5000, and therefore why not travel, buy an automobile, and give his family pleasure while he might? The individual instance is unimportant, but the cumulative effect of this reasoning is enormous.

In the past wage-earners and salaried employees have put their money into savings banks, insurance, building and loan companies, and land. The last is becoming too expensive for all men to buy, and, first in the cities, we are becoming a nation of tenants. Building and loan associations, being occasionally dishonestly and often poorly managed, have lost favor. One or two notorious failures contrib-

uted greatly to nearly killing what once seemed likely to be a most helpful form of coöperative saving and investment. The insurance scandals, followed by later investigations of stock exchanges and banks, have done much to discredit the older forms of investment with the wage-earner. It was made abundantly clear that the course of money from the savings bank or insurance company back to the channels of trade, while it gave unquestioned security, was one which clipped the profits of the man whose money, in the end, was invested. The mechanism of trade and industry being exposed to view, has caused the average man to feel, justly or unjustly, that others have had the major profit from the sacrifice he made in saving. As a result of all this, the tendency to cut across lots, a disposition always strong in Americans, has been greatly strengthened. Money for new enterprises is now largely found by sale of bonds, and these are 'peddled out' rather than disposed of through stock exchanges. Speaking in general terms, the latter have been abandoned to professional speculators, to their own great disgust.

No country can afford to cease reinvesting. Increasing population demands increased facilities for trade and commerce. New wants demand new factories, and growing trade demands more abundant and better means of transportation. Magnificent as has been the development of railroads in the United States, it is well recognized that any quick or large expansion of industry would find the country as unprepared as in 1905, when freight blockades and car shortage became national calamities. The very life of the nation demands the keeping clear of the channels for reinvestment. It is this, we believe, rather than any sentimental desire to upset the natural law regarding foolish ones and hoarded gold, that gives importance to the demand for 'blue sky' legislation. A largely new, and fairly satisfactory, method of reinvestment has been found in this sale of stocks and bonds direct to the people; it is of first importance that such securities represent something more than the promoter's cheerful optimism typified by the blue of the sky, and that the newfound confidence of the investor be not abused.

Kansas, which has often led in social legislation, has enacted a law requiring in effect that, prior to sale within its borders of any stocks or bonds, the selling agency must have a certificate from the State Bank Commissioner. To obtain such certificate, it was necessary to make a complete and frank statement as to the resources of the company concerned, and the Commissioner was empowered to refuse the right to sell unless he was convinced that there was a reasonable hope of success of the enterprise. Such a measure is clearly one that may be of great benefit or great harm, and, while the principle of enforced publicity is one that we fully endorse, it is certainly a serious matter when it is proposed to enact the Kansas statute practically without change and after only briefest trial, in twenty-nine other states. This is not making profitable use of experience. Incidentally, it does not seem to be generally known that the Kansas commissioner, who seems to have enforced the law with admirable judgment, has himself recommended its extensive amendment to clear the way for the legitimate work of established dealers in investment securities. Other states do well to profit by Kansas' experience, but they should be careful to get full profit.

The need for 'blue sky' legislation lies in the greed and incapacity of a common class of promoters, and in the limitations of the common legal basis for recovery of damages from purchase of 'fake' stocks. Speaking in broad terms, in order to make such recovery it is necessary to show: (1) that false statements were made; (2) that such statements were known to be false by the one making them; (3) that they were believed by the purchaser; (4) that he acted upon that belief to his detriment. When to these requirements is added the difficulties inherent in the matter of responsibility of agents, and the technicalities of court procedure, it will be clear that the average small investor has no practical redress when he is induced to buy a worthless security. To preserve his confidence and to preserve this all-important habit of reinvestment, the field for the hopelessly crooked or hopelessly visionary seller of misnamed 'securities' must be restricted. In the method of doing it, however, lies danger. An opinion not based upon investigation is valueless, and if any state officer is to pass a valuable opinion upon all securities offered for sale, he must have large funds for investigation. Also, anything savoring of state endorsement of an enterprise is a sure road to disaster. We believe that full and complete publicity, with adequate records made easily and cheaply available to any intending investor, reinforced by some suitable means of enforcing penalties for misrepresentation, afford an adequate means of meeting the situation. The large majority of new enterprises fail because they are ill advised, poorly managed, or overloaded with promoters' profits. Speaking especially of the 'cheap' mining stocks peddled about, they may in most cases be shown to be hopeless from a sound investment point of view by a plain analysis of a truthful statement of properties, rights, and promoters' shares. It does not seem improper to require such a truthful statement prior to allowing public sale of securities, and with such statement easily available and plainly set forth, it would not be hard to sift the good from the bad. Good management can only be secured by active participation in an enterprise by competent stockholders and directors. The state can not assure this. Perhaps it can not altogether prevent the use of loaded dice, but it should be possible to furnish X-ray photographs that would show the skeleton of any business organization, and it is proper to impose severe penalties on the making of false statements in connection with any such public record as here contemplated, and to refuse permission to sell, to any who can not give a simple clear statement of assets, liabilities, and participation. What constitutes simplicity and clearness in such a statement may be left to the discretion of an executive officer. He will make mistakes and there will be injustice and possibly graft, but in the end relative rather than absolute justice in this as in other things is all that we may hope to attain.

Storage of Coal Under Water

By R. G. Hall

The frequent and prolonged strikes and suspensions of operations in the central coalfields have presented to the industries dependent thereon very serious problems. Not only has the cost of factory operation been materially increased during these times of suspension, but for those industries where the cost of fuel is a considerable item, as in the zinc smelting industry, the whole margin of profit is likely to be entirely wiped out. Those who use the larger sizes of coal have partly solved the problem by storing the required amounts of fuel in piles. By this method, however, the depreciation in quality of the coal, as well as the rehandling and carrying charges, have been so serious as to make the ultimate cost of the coal, based on the heat units recovered, a very heavy charge. Besides, the storage of screenings finer than 1¼-in. in piles exposed to the weather is practically impossible, as the smaller sizes of coal in this field suffer heavy depreciation in quality, and unless carried in very low piles, or protected in some manner will almost surely fire spontaneously. It has long been known, however, that the depreciation of coal when stored under water is slight, and the problem for those burning screenings has been met in this way by a number of concerns in Illinois and elsewhere.

While acting for a zinc smelting concern operating in Illinois, burning several hundred tons of screenings daily, I was obliged to give close study to this problem, and a solution was finally worked out which has now been in practical operation for a number of years.

Providing a Pit

The construction of a pit capable of containing up to one hundred thousand tons of coal, as well as the water necessary to submerge the same fully, was a problem which at first indicated a capital expenditure out of all proportion to the advantages to be gained. In addition to this the cost of unloading the coal from cars into the pit, and its recovery therefrom, together with the necessary switching of the cars, figured up to a total altogether too high considering the small margins available in the zinc smelting business. Much studying and experimenting, however, gave a solution which for capital expenditure and operating cost would seem to be favorable, when the tonnages handled are considered.

A pit of approximately the required capacity was found at an abandoned brick yard in the outskirts of town. This pit was irregularly elliptical in shape, about 450 ft. long and 250 broad, while the depth was 45 ft. On account of the drainage conditions of the surroundings the pit is always filled with water within about five feet of the top. The banks below this level, that is below the loam, consist of comparatively hard shale. Hence the sides, which are quite steep, and the bottom, are ideal for reservoir purposes. It was at first considered that it would be desirable to cover these sides and bottom with a skin of concrete, but thorough examination after pumping out the water convinced me that the cheapest, and probably the best, bottom at that time was coal screenings, which at that season cost about 45c. per ton delivered at the pit. Accordingly no other bottom was put in, and the results have amply justified the experiment.

Pumping Coal

Owing to the tonnages to be handled, and the small margin allowable, it was absolutely necessary that the labor and power costs should be low. Experiments showed conclusively that the coal could be handled entirely by water through centrifugal pumps, but it was some time before the proper type of pump was secured. Working in conjunction with the engineer for the builder, I was at last able to design a pump which would handle the maximum quantity of coal with the minimum of water. The pump is not necessarily the most economical of power for the material and distance handled, but during the handling of 50,000 tons of coal, and although at times it has carried material as much as 50% solids, and will maintain an average of at least 30%, it only choked once. That was brought about deliberately in testing.

The plant is equipped with a railroad track along the longest side, with a total capacity of 30 cars. At the point where the railroad comes closest to the side of the pond the track is carried on a low trestle over an unloading chute. This chute is sufficiently wide to accommodate one coal car, and only so much below the trestle as to allow about one foot clearance under the track stringers. The bottom slopes toward the pond about 10%, and the outlet into the pond is constricted to about 4 ft. wide. At the side remote from the pond (the high end of the chute) is a 10-in. pipe having 6 holes of 4 in. each, cut in the side. This pipe is attached to a common 10-in. centrifugal pump delivering about 3500 gal. per minute. The suction of this pump is back in the pond, properly protected from an influx of coal. The cars used are of the standard Chicago & Alton drop-bottom type. These cars drop their loads in four sections, two on each side. Two men operate the plant, as the pumps run without attention from them. The plant is equipped with a heavy car-puller capable of moving 10 or more loaded cars.

Method of Unloading

When the loaded car is placed on the trestle the men open the drops, section by section, which takes about two minutes. This throws about 90% of the whole car load into the chute. This causes the water to back up in the chute until the accumulation is sufficient to move the whole mass of material. On account of the narrowing of the mouth of the chute, the velocity attained is at times sufficient to carry the greater portion of the material at least half way out into the pond. When the bulk of the material has moved out, the operators then close a valve

CARS OF COAL ARE DUMPED THROUGH THE TRESTLE SHOWN IN THE UPPER PICTURE AND FLUSHED INTO THE POND, BEING DISTRIBUTED TO ANY POINT BY MEANS OF THE DELIVERY PIPE SHOWN IN THE MIDDLE, AND LOADED OUT BY MEANS OF THE ELEVATOR SHOWN IN THE LOWER PICTURE.

in the pipe to the chute, and this throws the whole stream directly into the car itself. A few moments of the stream properly directed into the sides and ends is sufficient to clear the car absolutely, and the next car is placed. The whole operation, from the time one car is ready to unload until the next is ready, averages 10 minutes. The actual operation requires much less, but delays are frequent, owing to bad order drops on the cars. The actual unloading capacity of the plant is limited by the trackage and the ability to get the cars switched often enough. Owing to the limitations of space, only about 15 cars can be handled without re-switching. As it is possible to get service twice daily, there is no difficulty in unloading 30 cars, or 1500 tons, in a day. This is done at a labor cost of $4 and a power cost of $10 to $20. When the coal around the mouth of the chute accumulates so that its removal becomes necessary, it its thrown out to the remoter parts of the pond by means of the coal pump itself. These two pumps are operated by electric motors, supplied with current from the local utility company. As the power demand is intermittent, the price charged for the actual consumption is high, averaging about 5c. per kilowatt-hour.

Re-loading the Coal

Adjacent to the unloading chute is the re-loading machinery. The part on the bank consists simply of a hopper excavated and lined with plank; in the hopper is placed the boot of the re-loading elevator; the sides of the hopper slope directly into the elevator. The arrangement is such that the coal and water are pumped directly into the elevator boot, and the water is forced to travel slowly around the hopper before finding its way back into the pond. The elevator consists of long-pitch steel chain, provided with continuous buckets especially designed for this work. At the present speed it has a capacity of 5 tons per minute, but will admit of a large increase over this capacity.

The coal pump is placed on a barge 15 by 40 ft., and is belted to a 50-hp. motor. This motor has been found to be unnecessarily large. Both the suction and discharge pipes are light spiral-riveted. As this material is so much lighter to handle, the shortness of life will be more than compensated by the ease of operation. The discharge pipe is carried on pontoons made from common oil barrels, which have proved to be both cheap and convenient. One operator on the barge is sufficient, and he finds no difficulty in moving around as the ground is worked out. For the most part, when the pump is drawing from the bottom of the pond and in a good stock of coal, the material will be drawn from a long distance, so that as much as 50 cars of coal will be loaded without a new setting of the barge. As the stock gets low, more frequent moves become necessary.

Settling Is Simple

Contrary to my own expectations, it proved to be a simple matter to settle the coal from the water. I had supposed that an elaborate settling system would be necessary, but the hopper proved ample for the purpose. It is true that the finer dust is washed away, but for the purpose for which this coal is used the dust is of doubtful value.

Tests of the coal for depreciation showed no appreciable change in heating value from freshly mined coal. Laboratory tests indicate a slight appreciation, which I believe to be due to the disintegration and to a large extent the removal of the fire clay as well as the dust of the coal; but this slight increase in heat units (if such really exists) is more than made up by the shrinkage in weight.

With reference to the total costs of the operation, it appears that the money to be made by the storage of the coal for market purposes is small. This project, however, was undertaken as an insurance measure, to guard against strikes, and to provide some means of equalizing the prices of coal at different seasons in the local Illinois field. As such it has been an unqualified success. The cost of equipment of such a pit of approximately 80,000 to 100,000 tons, is about $10,000, exclusive of the pit itself. In this case the pond and sufficient ground for tracks cost $5000. Conditions permitting this low cost were peculiar, and probably could not again be duplicated.

Cost of Storage

The cost of Illinois screenings during the time at which they are most plentiful averages about 55c. per ton, and our experience is that the shrinkage of total tonnage during the two operations of switching in, unloading, reloading, and switching out again will be about 10%. The switching or stoppage charge in this case is $3 per car. Taking into account all charges against the coal, the final costs may be stated as follows:

	Per ton.
Cost of coal	$0.550
Interest and amortization on plant	0.020
Labor cost	0.015
Power cost	0.035
Supplies, maintenance, and insurance	0.015
Interest on cost of coal	0.025
Depreciation of coal	0.055
Switching or stoppage charge	0.060
Total cost of coal	$0.775

This takes no account of watchman's services, which under proper conditions would not be necessary, and also assumes that the coal remains in the pit only during one season.

It is to be noted that this method of handling is based entirely on the use of screenings. Experiments have shown, however, that with properly designed apparatus and machines, equally as good results may be obtained in the handling of material not coarser than 6-in. screen. Where it is necessary to use cars with tight bottoms, there has been worked out another method of unloading which costs no more for labor and power than above given, and has the advantage over dumping with cradle that the first cost and complications of plant are much less.

The Elmore vacuum plant at the Sulitjelma mine in Norway produced 856 tons of copper concentrate during January.

Dry v. Wet Crushing at Kalgoorlie

By M. W. von Bernewitz

According to the last annual report of the Hainault Gold Mine, Ltd., owing to change in the character of the ore being mined treatment by the stamp-mill and cyanide plant is now unsatisfactory, and a dry-crushing plant may be necessary if the mine develops satisfactorily. The time seems opportune to review the treatment problem at Kalgoorlie. It is with some diffidence that I do this, although after eight years' general observation one should be in a position to do so easily. There are so many points to study and compare that the discussion may easily be inconclusive. Having watched the treatment of the ores by the dry-crushing method most of this time, I may be accused of being biased in its favor; I have also studied the wet-crushing process, and the general remarks of those in charge have been forgotten.

In general, the ores are of a gray to greenish color, of a schistose structure, and they show an increase in hardness and silica content with depth. They contain pyrite and tellurides of gold and silver, but no minerals harmful to treatment. There is little free gold, it being mainly in the pyrite. The most important constituents have an average of SiO_2, 63%; Al_2O_3, 4%; $CaCO_3$, 12%; $MgCO_3$, 6%; FeO, 7%; and S, 3½ per cent.

First Attempts

When treatment of the Kalgoorlie sulphide ores was started, the ore was not understood, as nothing like it had been treated in Australia before. In 1899-1901 several large plants were erected, and, while results were low, yet they were the means of spurring metallurgists to further trials. Gradually the present satisfactory methods were evolved. In the dry process, the effect of roasting was not thoroughly understood, and the ore in the leaching vats had to be cut out by picks and bars. Then the analyses revealed the changes in lime and magnesia during roasting. In the wet mills, losses through the gold in tellurides not being dissolved, and trouble through the pyrite not being properly saved, also upset results.

After the early failures in treatment, two schools of treatment grew up. The Associated, Associated Northern, Boulder, Kalgurli, Perseverance, and South Kalgurli now treat by dry crushing; the Hainault, Horse-Shoe, Ivanhoe, Lake View & Star, and Oroya Links by wet crushing. Machinery is as effective as can be, labor is well paid and intelligent, supplies of fuel and water are of the first order, economy is pushed into every department, and the plants are kept at work full time.

In the dry plants, if the roasting be good, there is little fear in subsequent operations, and there is only one product, and an easy one at that. It soon was found that tellurides were not soluble in ordinary cyanide solutions, but bromo-cyanide proved to be effective. It is used in wet mills where either concentrate, sand, and slime, or concentrate and all slime is produced. This necessitates three or at least two subsequent processes, and close supervision. Bromo is still used at the Horse-Shoe, Ivanhoe, and Lake View. The Oroya Links is not using it much now. Great care is necessary in its use, yet it has helped to materially increase the extraction in the wet mills.

Comparisons of Cost

The dry process is a trifle higher in cost than the wet process, but the residue from the former is lower than the latter. The comparison may be stated as follows: (1) dry process cost $2.50 plus the residue (average extraction 93% on $8.26 ore, equals 70c.) equals a total of $3.20 per ton; (2) wet process cost $2.24 plus residue (average extraction 88% on $6.84 ore, equals 69c.) equals a total of $3.20 per ton. These figures are the best obtainable, as all cost systems are not similar, and extractions are not always published. It is admitted generally that the dry work is superior to the wet. During the month of May last, the tonnage treated dry divided into the total yield gave the above average figure. In the same month, wet tonnage and output gave the average quoted.

On the one hand there is a residue from the dry plants which will not pay for re-treatment; but from the wet mills a residue of $1 or over can be re-treated by vacuum-filtration at a cost of 50c. per ton; and if the loss in treatment be 20c., the profit would be 30c., which is worth saving. A few of the dumps contain more than $1 per ton, but I speak of results of present practice. The Oroya Links published figures giving the value of its residue lately as 42c. Against the first cost plus residue of $3.20 in the wet mills, must be placed cost plus residue plus re-treatment in the wet process, or $3.20 plus 50c. equals $3.70 per ton. This shows an advantage of 50c. in favor of the dry process.

Dust Losses

Millmen maintain that a deal of gold is lost in dry crushing and roasting. From ball-mills and dust-houses about 0.5% of the ore may be lost, and in roasting in a modern furnace not more than the same amount. Dust losses are difficult and costly to determine, but estimating all dust to average in value with the original ore, one per cent of 2400 tons dry treatment daily of $8.26 ore equals 8c. per ton lost. Experiments have proved that there is no actual volatilization of the gold in roasting telluride ores. The average loss in weight in crushing and roasting ore at Kalgoorlie is 10%: made up of dust, 1%; moisture, 1%; sulphur, 2.5%; and CO_2 from carbonates, 5.5%. In roasting concentrate, the loss is only about 0.05%, and as this product averages some $50 per ton, the loss on 7000 tons treated monthly would be 3c., or 0.25c. per ton on 2730 tons treated wet daily.

The only amalgam in a dry plant is in the pans.

while in the other process amalgam is collected from boxes, plates, pans, in battery, and the concentrate plant. There is accordingly more supervision necessary in a wet mill, and risk of stealing is greater. The average loss of mercury is low.

Concentration has been carried to a fine point at Kalgoorlie, but none the less very fine mineral and telluride floats and mixes with the pulp going to leaching vats and slime plants. This fact is, to my mind, one of the reasons for difficulties in a wet plant on such ores, in spite of the use of bromocyanide.

Classifying in a dry plant consists only in separating the pulp for the pans, and any coarse discharge from the latter is returned for further grinding. In some stamp-mills, classification for tables, re-classification for tube-mills, and further classification for more tables, is necessary, and the system rapidly becomes complicated. It necessitates extensive systems of classifiers, launders, and return pumps.

The average cost of ball-milling is 50c., against say 42c. per ton for stamping. I think the former plant easier to look after than the latter. Both produce products that are equally well adapted to further treatment.

Efficiency of Roasting

This discussion would not be complete without mention of the general efficiency attained in roasting ore or concentrate. For capacity, fuel consumption, power, labor, and results, furnace work at Kalgoorlie cannot be beaten. As examples of roasting ore, the plants at the Associated, Perseverance, and Kalgurli may be mentioned, and of roasting concentrate at the Horse-Shoe.

One of the troubles at Kalgoorlie is the presence of graphite, which is found in the Associated, Associated Northern, Boulder, and Oroya mines. It does not seem to change during roasting, and causes a premature precipitation of the gold from cyanide solutions. Fortunately, the mineral does not come to the mills very often; but as to this effect, there is no doubt, and it is a nuisance hard to deal with. The Boulder is troubled with it more now than any of the other mines.

Introduction of Vacuum-Filters

Gradually the filter-press is being discarded in favor of vacuum-filters. In the past an immense sum has been spent on press plants, about 100 presses being erected, 80 of which are treating 100,000 tons monthly. The balance are out of commission, but the benefit derived from this machine at Kalgoorlie has been admittedly large. With a press washing can be carried to a degree that cannot be beaten, but the labor cost is high, and I expect that it will have to give way. The Associated Northern, Boulder, and Oroya Links filter their current mill slime by vacuum systems of their own, while others are talking about introducing the system. The lowest cost of treatment by filter-press is 24c. per ton, while 8c. should cover vacuum-filtration. Such a saving is important with ore yielding as low as $5.50 per ton.

The cheap price made for water, 36c. per 1000 gal., for sluicing away all mill residue, has simplified this work and done away with the further building of dusty dumps. Sluicing, on the whole, is cheaper than making dumps, and Kalgoorlie has much to be thankful for in connection with the great water scheme.

On the cost of erecting the two types of plants discussed, there is not much data on account of constant additions, improvements, and alterations. The Associated Northern plant, with capacity of 120 tons of sulphide ore daily, cost originally $180,000. For the same tonnage, a battery of 25 stamps would cost $125,000.

The margin between the dry and wet processes was large enough at one time, although extractions vary from 94 to 86%, respectively, and left no doubt as to which should be chosen. Now the stamp-mill work is improving slowly but surely, and the difference is small. For my part, I would build a dry-crushing and roasting plant to treat a similar ore.

Western Australian Gold Production

December returns from the leading mines are listed below:

Name.	Tonnage.	Value.	Profit.	Dividend.
Great Boulder	16,389	$248,300	$149,200	$328,100
Ivanhoe	17,266	158,400	52,800	.....

Formosa, the island belonging to Japan, had in 1911, 9 gold, 1 gold and copper, 27 placer gold, 16 sulphur, and 270 coal mines; and 39 oil wells, the production being valued at, gold, $1,069,500; silver, $32,525; copper, $264,513; coal, $468,367; sulphur, $22,950; and oil, $3243. The industry employed 5047 workers, most of whom were engaged in coal-mining. Wages paid ranged from 51.5c. per day for male Japanese to 11c. for female Chinese laborers. The three productive gold mines are east of Keelung. The output of placer gold is decreasing fast. The coal from the Denryoku mine shows 54.28% fixed carbon by analysis.

Milling v. Hand Sorting of Lead Ore

By R. S. Handy

The following tests and data were compiled in April 1912, in order to demonstrate to the management of the Bunker Hill & Sullivan Mining & Concentrating Co. the inadvisability of hand sorting the mill feed, under the conditions obtaining at its plant at Kellogg, Idaho. It is to be understood that each condition of mining and milling requires its own consideration and treatment, so that nothing which follows is intended as a criticism of other plants. In order to make comparisons, the following arbitrary conditions have been assumed in this paper: Price of lead, 4½c. per pound; price of silver, 60c. per ounce; smelter contract, 90% of the lead at 90% of the price for lead, 95% of the silver at the price for silver, and freight and treatment $18 per dry ton. In order to present the conditions at the Bunker Hill plant, a brief description of the ore-crushing department of the West mill follows:

Crushing Department.—The ore is hauled from the mine by electric locomotives and dumped into a storage-bin of 1700 tons capacity, from which it is drawn through chutes into the 'rock-house' and handled as shown on the accompanying flow-sheet (Fig. 1). The coarsest pieces in the run of mine ore are about 12 in. diameter and the sizing of the whole is, roughly, 80% through and 20% on a 3-in. ring. From the storage bin the ore is conveyed over a grizzly with 1¼-in. intervals to two No. 5 bronze ball gyratory crushers and reduced to 2½-in. maximum diameter, and, with the undersize from the trommels is conveyed to three 30-mm. trommels. The undersize of the trommels is conveyed directly to the mill storage bins of 1400 tons capacity, as mill feed. The oversize is passed through 14 by 36-in. rolls, set to ¾ in., and returned to the trommels.

Capacity and Cost of Crushing.—About 1100 tons (24 hours feed for the West mill) are handled in 6½ hours, under ordinary conditions, at a cost of 2.87c. per ton, as follows:

	Per day of 8 hr.	
Labor:		
1 crusher-man	$3.50	
1 rollman	3.50	
1 conveyor-man	3.50	
2 laborers	6.00	
Repairs	1.50	Per ton, cents.
	$18.00	or 1.636
Supplies:		
Mullers		0.217
Concaves		0.080
Shafts		0.026
Gears, eccentrics, and rings		0.040
Oil and waste		0.050
Babbit metal and zinc		0.050
Roll shells and miscellaneous		0.230
Power		0.543
		2.872

As a basis for comparison, the accompanying flow-sheet (Fig. 2) is taken to represent a typical sorting plant in this district. In such a plant the run of mine ore is run over grizzlies of about 1½-in. intervals and the oversize crushed in jaw crushers to about 6-in. maximum diameter, and, with the undersize from the grizzlies, is screened on 1½-in. trommels. The oversize of the trommels is washed by a spray of water and fed to a wide picking belt, where the waste and first-class ore are sorted out by hand and

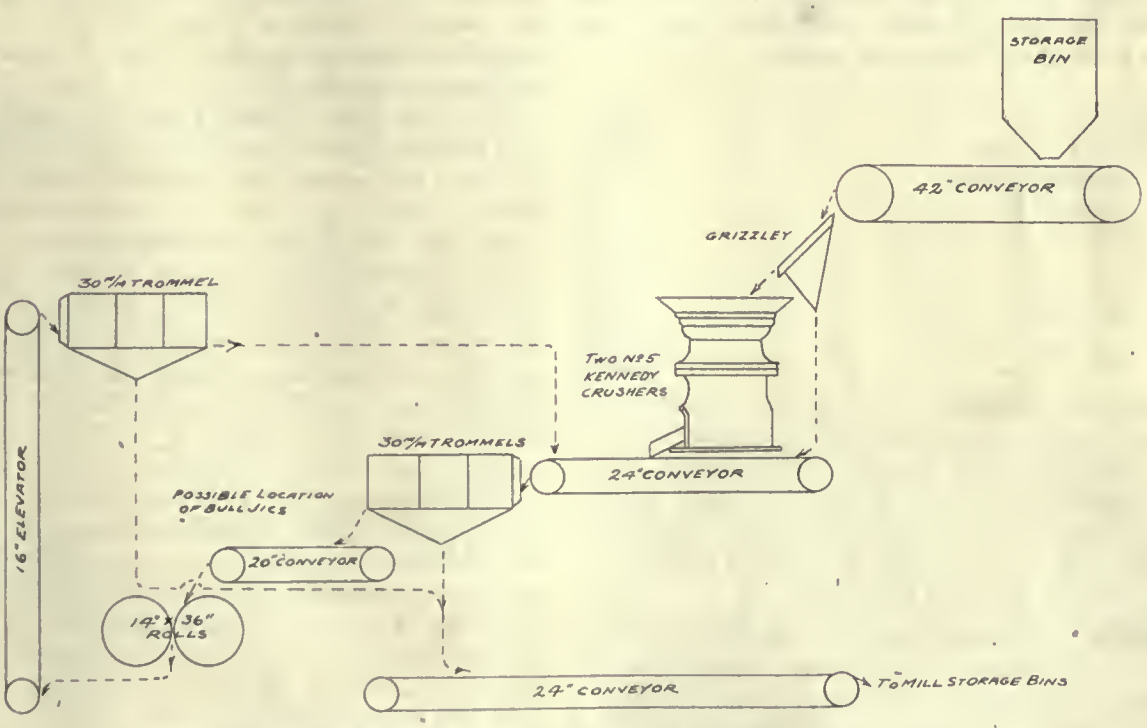

Fig. 1. Flow-sheet of 'Rock-House,' Bunker Hill & Sullivan M. & C. Company.

the residue passed to the mill; or the milling ore and first-class are sorted out and the residue passed to the waste dump. The undersize of the trommels goes directly to the mill. Approximately the proportion of products are eliminated as indicated in Fig. 2 and are taken for comparison, but these figures will vary with the character and grade of the feed.

Costs of Sorting.—My observation of plants visited in this district leads me to the conclusion that each ore-sorter will pick over about 12 tons of material per shift, and that the cost per ton of ore passing over the picking belt, including the cost of crushing, conveying, and screening the whole tonnage, would not be less than 30 cents. Detailed costs per 24 hours in the plant illustrated would be:

Labor:	
24 pickers, at $3	$72.00
3 car-men, at $3.50	10.50
3 crusher-men, at $3.50	10.50
1 fireman, at $5	5.00
3 sluice-plant men, at $3.50	10.50
	$108.50
Power and supplies	10.00
Total	$118.50

Purpose of Sorting.—Hand sorting is employed in this district for one or both of two purposes, namely, to increase the mill capacity by eliminating waste and first-class ore; or to increase the mill efficiency by sorting out for shipment ore upon which the smelters will make, or rather return, a higher economic recovery than the mill does.

Sorting to Increase Capacity.—The Bunker Hill & Sullivan milling plants have ample capacity, but assuming that it were advisable to increase this capacity, would hand sorting be the cheapest and most efficient means of accomplishing this object? To determine this point several tests were made on the run of mine ore, as shown in the accompanying tables. Table 1 shows results of a test of a one-ton sample that was hand picked to undersize and oversize of a 3-in. ring. The oversize was hand sorted into first-class mill feed and tailing, the object being to select the highest-grade ore and lowest-grade tailing possible with this size. In table 2 is shown the record of a test in which a one-ton sample was crushed by hand to 4-in. maximum diameter and washed on a 30-mm. round hole screen. The oversize was sorted by hand into three products, as above. Table 3 shows the results from tests made with the oversize of the 30-mm. trommels in the present 'rock-house' operations, treated on a two-compartment Harz jig with 25½ by 33½-in. compartments, 150 r.p.m., 2½-in. stroke. The material was fed at the rate of 100 tons per 24 hours.

A study of these tables indicates that in table 1 there is not enough material eliminated to consider In table 2, 153 tons of material was eliminated on a basis of 1100 tons of feed, and a high-grade ore and a

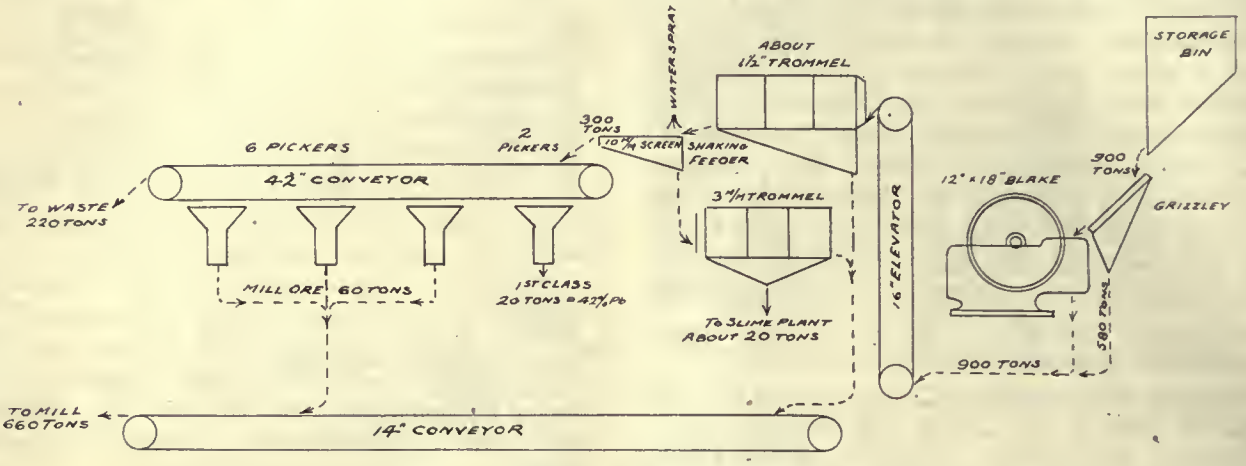

FIG. 2. FLOW-SHEET OF TYPICAL SORTING PLANT.

low-grade tailing were segregated. Considering this, at present, from a capacity standpoint, and assuming the costs of sorting as above, the cost per ton of added mill capacity would be 64½c. A jigging plant necessary to handle the 329 tons of oversize in table 3 in 6½ hours would consist of three two-compartment jigs with 36 by 48-in. compartments. These could be attended by one man and the added horse-power in a plant such as the 'rock-house' under consideration would not be over ten, so that the total cost of eliminating 44 tons of ore and 127 tons of tailing would not be over 3c. per ton of added capacity. Therefore, considering the question from a standpoint of mill capacity, it seems that the installation of bull jigs would be advisable. They could be installed below the discharge of the 30-mm. trommels without disturbing the equipment or operations.

In this connection it is interesting to note that the four jigs in the mill handling the material between 30 mm. and 15 mm. are treating 520 tons of feed per day and eliminating 320 tons of tailing assaying 0.4% Pb. They are also discharging 76 tons per day of concentrate averaging 53% Pb, and take only their proportion of the attention of the two jigmen who are attending 24 jigs.

Sorting for Economic Efficiency.—The proposal to sort for elimination from the mill feed of material that will bring higher returns by shipment to the smelters than it would from a milling operation involves several considerations, namely: (1) The losses in the mill operation on the material in question: (2) the points in the process where these losses occur: (3) the losses due to freight and treatment charges on barren material; (4) the effect that the elimination of sorted material would have on these losses.

In this connection, I have prepared three tables numbered 4, 5, and 6.

Table 4 shows the economic recovery (that is, the ratio of the full value of the feed to the net returns from the concentrates, at the prices and terms given economic recovery attained in the Bunker Hill & Sullivan West mill No. 2 on the various sizes of feed, based on 1100 tons per day of mill feed. The figures

at the beginning of the paper) from the sorting operations outlined in tables 1, 2, and 3, on a basis of 1100 tons of mill feed per day. Table 5 shows the given on the jigs are only for the machines which receive original feed, and not those rehandling reground products. On the tables and vanners, however, the mixture of the original feed and re-ground material is considered, as they could not be separated. Table 6 shows results of a sizing test of the products from the gyratory crushers and rolls in the Bunker Hill & Sullivan rock-house.

Referring to table 4, A and B, it will be seen that the percentage of money recovered from the value of the material worked over is very small. It is only fair to state, however, that in actual sorting operations a much larger tonnage of concentrate (or first-class) of a lower grade, and a larger tonnage of tailing of a higher grade is eliminated than those shown in the table. In fact, I think that the conditions in C of table 4 approximate the results from actual sorting operations. It will be seen that in C, 34.6% of the value handled was recovered.

In table 5 it may be noted that in each of the operations outlined, with the exception of the vanners, there has been a greater percentage of money re-

covered than under the most favorable conditions of hand sorting. In fact, it might be said that as long as the material remains crystalline, the finer it becomes, the greater the profit per unit value of feed is returned from concentrating it.

In consideration of the question as to whether the extra crushing necessary to reduce the oversize of the 30-mm. trommels to undersize of 30 mm. produces an appreciable amount of vanner feed, upon which a lower recovery is attained than from the sorting operation, table 6 is useful in showing that the minus 200-mesh material produced in the crushers and rolls is practically negligible.

Conclusions

1. The additional cost of crushing the oversize of 30 mm. through 30 mm. is hardly appreciable.

2. Jigging the undersize of 30 mm. is cheaper and more efficient as a means of eliminating tailing than is hand sorting or jigging the oversize.

3. Therefore, the mill capacity should be increased by adding to the regular mill equipment, if possible.

4. Where sorting of the oversize must be done, jigging is cheaper and as efficient as hand sorting.

5. Economic recovery from sorting the oversize is much lower than from crushing, sizing, and concentrating it.

Structural Materials in California

Development of structural materials of California has received but scant attention as compared with that of gold, oil, and copper, and is capable of great expansion. A great deal has been written about building material of this state, and an exhibit of such products has been permanently set up at the State Mining Bureau, San Francisco, under the supervision of W. W. Thayer, where those interested may see that it is no longer necessary to go out of the state of California for the best. In 1912, the value of structural materials produced was approximately $21,000,000, or about 20% of the total output of all minerals. Details of estimated production in 1912 of certain materials are as follows:

Asbestos	$ 3,000
Cement	10,500,000
Brick	2,750,000
Clay-pottery	275,000
Granite	400,000
Gypsum	125,000
Infusorial earth	25,000
Lime	450,000
Limestone	550,000
Magnesite	80,000
Marble	75,000
Sandstone	125,000

A Permanent Exhibit

In the Mining Bureau exhibit the floor in the hall at the entrance is laid with magnesite, in two colors, and blocked off to imitate 8 by 8-in. tile. This material was furnished and laid by the Chemolith Manufacturing Co., of Los Angeles. The main arch at entrance is constructed of architectural terra-cotta in colors, and was furnished and erected by Gladding-McBean Co., Steiger Terra Cotta & Pottery Works, N. Clark & Son, and Carnegie Brick & Pottery Co., all of San Francisco. A panel in this arch, designed by Domingo Mora, makes this particular portion of the exhibit an interesting one. The inside of this archway includes round columns and square pilasters with pediment constructed of white and red sandstone, furnished and erected by the Ione Sandstone Co., Sacramento. The second main archway at the entrance to the mineral museum consists of polished granite columns and pilasters with pediment, furnished and erected by the Raymond Granite Co., San Francisco, and the California Granite Co., Rocklin.

In the centre of the exhibit is a large fountain, which is electrically lighted, and will be in operation during the hours that the museum is open to the public. This fountain was designed and placed in this exhibit to illustrate the possibilities of California cement in this class of work. It was furnished by the Henry Cowell Lime & Cement Co., and the sculpture work was executed by O. S. Sarsi Co., both of San Francisco. The floor in the central portion of the exhibit around the fountain is laid with composition flooring to imitate tile, and was furnished and laid by the Carrelin Asbestos Flooring Co., San Francisco.

Marble Work

The marble tile floor that has been laid in the vestibule and marble panels in the floor of main exhibit room, also three marble panel sections of side walls, were furnished and erected by the Columbia Marble Co., San Francisco. Another section of marble panel work was furnished and erected by the Banning Marble Co., Los Angeles. This marble is quarried on Santa Cataline island. The marble work of panels over fireplaces, and wall panels on the west wall of the exhibit, was furnished and erected by the Warren Marble Co., San Francisco. The wainscoting on the north and south walls of the exhibit is constructed of ornamental and sand-lime brick, furnished and placed by the Golden Gate Brick Co., the Furlow Pressed Brick Co., and the Los Angeles Pressed Brick Co., Los Angeles; the Stockton Fire & Enamel Brick Co., Stockton; and the United Materials Co., San Francisco.

Two large open fireplaces have been erected in this exhibit; one constructed of 6 by 6-in. mat-glazed tile, with white tile fire-box, furnished and erected by the Pacific Tile & Terra Cotta Works, Los Angeles, and the other of 6 by 6-in. rough-glazed tile, furnished by Gladding-McBean Co., San Francisco.

The balustrade separating the main exhibit room from the hallway is constructed of sandstone, furnished and erected by the Colusa Sandstone Co., San Francisco. Two polished granite newel posts and two polished granite pilasters were furnished by the Academy Granite Co., Fresno. Polished granite pilasters were also furnished by the following firms: Placer Granite Co., Rocklin; North California Mining Co., Oroville; McGilvray Stone Co., San Francisco; Bly Bros. Stone Co., Los Angeles; Riverside Granite Co., Los Angeles; and A. O. Wickman, Rocklin.

Electric Power Installation at El Tigre

By James W. Malcolmson

*The Tigre Mining Company of Mexico, owned by the Lucky Tiger Combination Gold Mining Co., of Kansas City, decided early in 1910 to enlarge its mill, which consisted of a concentrator milling 3000 tons of ore per month. The enlarged plant was designed to crush and concentrate 6000 tons of ore per month and to cyanide 7500 tons monthly. The extra tonnage cyanided was to be obtained from tailing which was stored below the old mill. Power was supplied to the old mill from four boilers, a 150-hp. Corliss engine using producer gas made from charcoal. The total power required, including 60 hp. used for machine drills in the mine, was approximately 275. Cordwood cost $4.32 per cord, 8 by 4 by 3 ft. and charcoal $15 per ton. The fuel supply in the surrounding country was approaching exhaustion; over 150 mules and 90 men were engaged in cutting and transporting this fuel, and in the unsettled political conditions in Sonora were such that it would be practically impossible to keep an organization of this kind together. The price of fuel was steadily rising and at times it became almost impossible to get sufficient fuel to operate.

Power Estimates

It was estimated that the enlarged plant, together with the mine, would require 750 hp. as follows:

	Hp.
Old mill, which was left unchanged	180
New concentrator	90
Cyanide plant	380
Mine and other requirement	100
Total	750

In a study of the best manner to obtain power, the following alternative propositions were considered:

1. To continue using the local fuel supply and by building tramways and cheapening transportation generally, reaching a larger area of country. Power to be generated by means of wood-burning gas-producers and gas-engine plant.

2. To build a steam power plant at Yzahal, the nearest railroad point, 30 miles away, and transmit electric power to the mine, using Texas or California oil as fuel at $1.70 per barrel, on the assumption that the Mexican government would remove the import duties.

3. To build a dam on the Bavispe river, 10 miles from the mine and a hydro-electric plant and transmission line.

4. To erect a power plant at Douglas, Arizona, and transmit electric power 65 miles to the mine.

An investigation of the available timber showed that it consisted of 80% white pine and 20% scrub oak. The supply was limited, and much of the pine would be required during the next ten years for mine timbering and general construction work. It is estimated that 13,500 cords of wood, 8 by 4 by 3 ft. would be required, per annum, to produce 750 hp. in a well designed gas-engine plant as follows:

	White dry oak.	Dry pine.	Total.
Hp-hr. per year	1,600,000	4,800,000	6,400,000
Consumption per hp-hr., lb.	3.31	3.0	.....
Total lb. per year	5,280,000	14,400,000	19,680,000
Total cords per year	2,000	10,900	13,500

Estimating these 13,500 cords at $3.25 gold per cord, equals a total of $43,875 per annum. Adding coke used in the bottom of the producers, 1½% of the weight of the wood consumed, equal to 150 tons per annum at $20 per ton, equals per annum $3000, gives a total fuel cost of $46,875.

A Steam Plant

A well designed steam plant at Yzabal with electric power transmission to El Tigre, would consume 1½ lb. of Texas fuel oil per horse-power delivered to the motors. Taking 750 hp. for 356 days equals approximately:

6,400,000 hp-hr. at 1½ lb.	9,600,000 lb. oil
311 lb. oil per barrel equals	30,870 bbl. oil
$1.70 per bbl. at Yzabal gives total fuel cost per year in gold	$52,480
Excess cost over gas fuel at the mine	$5,605

This difference would be wiped out by an increase of $0.50 gold per cord in the cost of 13,500 cords per year. In fact, before the new power plant was in operation the price of cord wood had increased $1 per cord and the cost, under any circumstances, would have steadily risen. Even with wood at $3.25 per cord the estimated saving was more than offset by the greater expense for labor, repairs, and supplies with gas engines. In a plant of this size the expense of gas power would be nearly twice as much for repairs and supplies as for the corresponding items in a steam-power transmission plant. The cash expenditures per annum would be greater at El Tigre than with a steam-electric plant at Yzabal even if there were no increase in the cost of wood.

Gas-Engine Plant

Regarding first cost, it was estimated that gas-engine power would be unsatisfactory unless the plant had one spare engine to allow for periodical cleaning of each engine in turn. It was estimated that a suitable plant of gas-producers, gas-engines, and dynamos could be erected only at El Tigre, 30 miles from the railroad for $150,000 gold, taking the European cost of engines. Engines made in the United States would cost more.

The first cost of a suitable steam plant at Yzabal with electric power transmission to El Tigre was estimated at $213,400, including economizers, as below:

Power-plant at Yzabal erected complete	$133,000
Economizers (not considered essential)	17,000
Transmission line to El Tigre, 30 miles, 30,000 volts	30,000
Step-up and step-down transformers	14,000
Margin on a preliminary estimate, 10%	19,400
Total estimated cost	$213,400

The estimated cost per horse-power delivered per year using 750 hp. was $105.

*Read before the New York meeting of the A. I. M. E. and printed in *Western Engineering*.

Compared with power transmitted from a steam plant at Yzabal, gas-engine power at El Tigre would be less reliable and more troublesome, and the proposal to erect a local power plant at the mine was, therefore, definitely rejected. After an expert examination of a proposed dam on the Bavispe river, this was also abandoned. The river is usually 150 ft. wide and 2 ft. deep, but at times it is 200 ft. wide and 24 ft. deep. During very dry seasons the river is not over 6 in. deep. If a dam and power plant were built, involving enormous cost and many miles distant, a duplicate steam plant would also be necessary, and the total estimated cost proved to be out of all proportion, when compared with the other projects.

Power from Douglas

Before finally deciding to build the Yzabal, which is 45 miles south of Douglas, an investigation was made as to the possibility of securing power from that town. In Douglas, the power plant of the Copper Queen Consolidated Mining Co. develops approximately 8000 hp. for the requirements of its smelter. An arrangement was made whereby the Copper Queen company agreed to install steam turbo-generators in its plant and supply electric power to the Tigre Mining company. The installation was to be paid for by the Tigre company, and the power sold on a sliding scale varying with the amount taken and the cost of fuel oil in Douglas. In August 1912 this amounted to 0.96c. per kilowatt-hour at Douglas. The installation of an exhaust steam-turbine plant at Douglas presented several advantages, although the cost of the machinery, together with the 65-mile transmission line to the mine, was considerably in excess of the Yzabal project with a 30-mile transmission. The principal advantage, which led to a final decision to adopt the Douglas plan, was the cost of power.

Cost of Transmitted Power

Taking 750 hp., it was estimated that a plant at Yzabal would cost per year $79,000, or $105 per horse-power delivered at El Tigre per year. Power from Douglas delivered at the mine, it was estimated, would cost slightly over $70 per horse-power per year, or from $54,000 to $57,000 per year, depending on whether one or two turbines were required. In other words, the Douglas project showed a saving on cost of power of $25,000 per year, and it was decided in July 1910 to adopt the Douglas plan and build a line to the mine. In June 1911 power was delivered over the line to El Tigre, the revolution in Mexico causing some delay in prosecuting the work.

The plant at the works of the Copper Queen Consolidated Mining Co. at Douglas consists of two 750-kw. exhaust steam turbo-generators which will work with a 50% underload or overload without any very serious loss of efficiency. The Tigre Mining Co. received power at the buss bars at a tension of 2200 volts. This is stepped up to 44,000 volts by means of three General Electric transformers. At the mine the current is stepped down to 440 volts and distributed to the various circuits in the plant.

The transmission is unusual on account of the small quantity of power being transmitted such a long distance. The current is 44,000-volt, 60-cycle, 3-phase, transmitted over a single line of wooden poles carrying 3 conductors of No. 4 B. & S. gauge, medium, hard drawn copper wire with telephone wires below. The poles are 200 ft. apart; at the crossing of the Bavispe river the span is 1600 ft. The cost of the line from the low-tension side of its step-up transformer station at Douglas to the low-tension side of its step-down transformer station at El Tigre was $161,121. Not including the transformer stations at each end, their cost was very closely equal to $2000 per mile. The line, including the transformer stations, was built by Sanderson & Porter, of New York. The total cost of the exhaust steam turbo-generator plant, including the steam piping, etc., was $71,894, the machinery being placed by the Copper Queen Consolidated Mining Co. During the past year 6000 tons of ore has been concentrated monthly and 7500 tons cyanided at the Tigre mill; an average of 616 hp. is distributed at the El Tigre switchboard. The delivered cost is $86 per horse-power per year; the cost at Douglas being 0.95c. per kilowatt-hour.

Ladder Ways

Coincident with the so-called 'Red Cross craze' on the Lake Superior iron ranges, by which the miners are learning first aid to the injured and rescue work, there is a strong movement to lessen accidents by safeguarding all dangerous places. It is pointed out in Minnesota that 10% of all the industrial accidents in the state are due to falls. Under this head the ladder-road in shafts and raises is a fruitful source of falls in underground mining. The Oliver Iron Mining Co. has accomplished a great deal in the safeguarding of ladders. The following are the newer regulations.

The opening of the ladder way on surface shall be protected by a closed door to prevent stumbling into the hole. The ladders shall extend four feet above the door so that one may get on them without crawling into the hole to do so. All ladders shall be at least four inches from the side of the shaft, to allow a good hand and foot hold. The landings are normally twelve feet apart, though under exceptional conditions they may run from 10 to 25 feet. The man-hole from a landing to the ladder below is always directly beneath the ladder which is placed at an angle across the hole, so that it forms an absolute protection against falling more than the length of one ladder. The significance of this system may only be appreciated by one who has stood by a ladder road and heard some agile young miner shoot down, his feet glancing from rung to rung with a sound on the steel like a steady rat-a-tat on a hollow tree.

The Briseis Tin & General Mining Co. is best known for its connection with tin mining in Tasmania, but it also owns the Wallace gold placers in Victoria. From the latter $13,500 was won by working 115,600 cu. yd. last November. The same month the company produced 45 tons of black tin from its Tasmanian properties.

New Method of Zinc Precipitation

JOHANNESBURG CORRESPONDENCE

In a paper just read by John S. MacArthur before the Chemical and Metallurgical Society of South Africa, the use of zinc wafers in preference to any other form for precipitation purposes was recommended. It was pointed out that all attempts to displace zinc by the use of charcoal or electricity had failed, and as an effective chemical agent, filiform zinc had shown itself hard to beat, although C. W. Merrill had successfully introduced the use of zinc dust.

Physical Structure Important

Probably the high chemical activity of the zinc thread had much to do with its success, for if it is examined under a lens it will be seen that while one side is polished by the cutting tool, the other side has a velvety pile exposing a large surface to the auriferous solution, which accounts for the prompt responsive action of this form of zinc. The velvety pile seems to encourage the liberation of free hydrogen accompanying the precipitation of gold. The disadvantages of filiform zinc are due to its structure and mechanical considerations involved in its use and in dealing with the bullion precipitate. Then again, zinc thread is weak and its fibrous structure is destroyed by the cutting tool, the velvety surface being only an indication of the thread having been strained beyond the breaking point of the original fibre. The solution soon penetrates the pile of velvet, and the spongy zinc thread collapses into a dirty mush before its full chemical work is accomplished. Thus it is that bullion precipitates generally contain at least 50% of disintegrated zinc needing elaborate methods of refining, which, being complicated by the dusty nature of the precipitate, call for stringent precautions against loss. There is another disadvantage attached to the use of zinc shaving, and that is the difficulty of packing it with perfect regularity, some parts being tight and others comparatively loose, resulting in the solution selecting the easiest path where the possibilities of contact and precipitation are least. This is contrary to what we wish, as it results in only a small proportion of the solution passing through the tight part where the possibilities are, of course, greatest for the consumption of zinc chemically, and the disintegration is just about the same, whether the precipitation is active or sluggish.

Zinc Cut Into Wafers

Mr. MacArthur had aimed to overcome these drawbacks by using zinc sheet cut into wafers of convenient size, one to two inches long by one-quarter to one-half inch wide. Oblong wafers pack better and are more conveniently handled than when square. The wafers are made by cutting ordinary sheet zinc of a convenient gauge, say No. 11, into 1½-in. strips in a bookbinder's guillotine and then cutting these strips crosswise so as to produce wafers approximately 1½ in. long by ¼ in. wide. When these wafers fall into the cell of the zinc box they arrange themselves irregularly, more or less overlapping in slate fashion. The corners of each wafer are somewhat distorted by the guillotine, which prevents any sticking, providing at the same time channels for the uniform passage of the auriferous cyanide solution, ensuring an equal opportunity of precipitation in all parts of the mass.

The resistance to the flow of the solution is much greater with wafers than with filiform zinc, making it necessary for the extractor boxes to have at least twice the usual fall, while the cells and the boxes may be made with only half the usual depth. This method of precipitation was introduced at the Caveira mine in Portugal, in 1907, where the ore contains about 2.5 gm. of gold and 120 gm. of silver per ton. With coarse-crushing the average extraction is about 80% of the gold and 75% of the silver. The cyanide plant was equipped with the usual clean-up plant, but as the bullion precipitate only contained 3% of zinc and 12% of other foreign matter it was found that no acid treatment was necessary. Careful observations show that in use the zinc wafers become thinner and thinner until at the end of three weeks or so they disappear altogether without the structural strength being impaired or leaving distinguishable débris. This new method of treatment has proved itself economical in the consumption of zinc, has greatly simplified the clean-up, and thus saved time and temper.

Experiments at Caveira

The use of this kind of zinc has been described by Messrs. Lloyd and Rand in connection with a rotary extractor, in 1909. The operations at the Caveira mine some two years earlier showed that a revolving extractor-box was unnecessary in using zinc wafers, and as the method has been tried both in Italy and Mexico with equally good results, its success is now proved. It may be said that at the Caveira mine in Portugal the precipitation is facilitated by the presence of a large amount of silver with the gold, but in Italy the mine produces only a low-grade gold ore without silver, and as the wafers do their work well there also, it may be assumed that they will answer anywhere. The cost of installing the guillotine, the only special appliance needed, is only £10 or so, a much less sum than that required for a zinc turning lathe of equal capacity.

Broken Hill mines in 1912 produced the following:

	Tons.	Value.
Silver-lead concentrate	279,915	$13,000,000
Zinc concentrate	433,054	6,500,000
Silver-lead ore	29,605	430,000
Silver-lead slime	4,503	32,000
Total value		$19,962,000

Excepting in silver-lead slime, the products showed an increase over 1911, while the value for that year was $14,880,000. Dividends paid in 1912 totaled $8,600,000.

Charters Towers, Queensland, produced $2,094,400 from 136,430 tons of ore in 1912. Dividends amounted to $175,200, and assessments $172,800.

Hydraulic Mining in British Columbia

The most important mining work done in Quesnel Division in 1912 was that of the Quesnelle Hydraulic Gold Mining Co., which commenced preliminary hydraulicking operations in August 1911, and after a run of nearly three months stopped work on November 7, cold weather having suddenly set in. No clean-up was made, so no gold recovery was reported for that year. The then newly completed water-supply system was found quite satisfactory. Water is brought from Swift river, a distance of 25 miles. Besides the long ditch-line, there are three inverted siphons. The flow of water has been as much as 60,000,000 gal. (about 4000 miners' inches) in 24 hours.

The wear of the diorite blocks or boulders with which the sluiceway was lined in 1911 having proved excessive, and maintenance cost proportionately high, before the 1912 hydraulicking season opened the sluice was paved with high-carbon steel rolled plates, containing from 0.80 to 1.20% carbon, and of dimensions of ½ in. thick and 58 in. square. At the end of that season it was ascertained that these high-carbon steel plates gave even greater efficiency than had been expected, both in regard to duty obtained and the absence of any appreciable amount of wear. From the rate of wear—or, rather, lack of it—the conclusion is that they will stand at least 20,000,000 cu. yd. of gravel being passed over them before they will be worn out. The season's experience with these plates was in striking contrast to that of the previous year with ordinary wooden blocks which lasted only a few days, while diorite boulders wore as much as 8 inches in three weeks. No trouble was experienced from sand packing under the plates, which so evenly distributed the gravel over the full width of the sluiceway that there was no tendency to wear in the centre of the plates, such as was experienced with steel rails. The plates may be used for gold saving by separating them for about 2 in. and allowing each succeeding plate to be lower in level, about ½ in., to avoid excessive impact of the boulders moving from one plate to another. This arrangement was found much superior to placing the plates end to end, which latter plan naturally would be used so as to provide a continuous smooth surface. As plates so nearly 5 ft. square provide for a riffle only every 5 ft., it is considered advantageous to place rails at the head of the sluice for such a length as to ensure the recovery of the gold. The rails used here were of rolled manganese steel, but it was seen that, although their wear was much superior to that of ordinary steel, their life will be only a small fraction of that of the plates, so their use cannot be recommended except for gold-saving purposes.

The cost of operating this season (including all actual mining expenses, but no interest or amortization charges) was stated to have been reduced to 2c. per cu. yd. of the material handled. This was just one-half of the previous season's cost, which great reduction was due almost entirely to the use of the steel plates, for it allowed of the working force being reduced in number from 40 to 22 men for mining 9000 cu. yd. of gravel per day. It is believed that in next season's operations a further reduction will be made to even lower than this low cost. As a result of last season's operations, the position of the main pay-channel of the ancient river system on which work is being done was ascertained. This system has been definitely traced for approximately three miles, and it is about one mile in width. The season's work, through the amount of gold recovered, determined the situation of the main part of the channel, so that it is thought there need be no question as to the proper place for the construction of the main sluiceway next season.—British Columbia Bureau of Mines *Bull.* No. 1, 1913.

Malay Tin Production, 1911

The following table, showing the quantity in tons and the value of tin and tin ore produced in the Federated Malay States during 1910 and 1911, the weight of tin being calculated at 70% of the ore, is taken from a recent consular report.

	1910.		1911.	
States.	Tons.	Value.	Tons.	Value.
Perak	25,080	$18,540,708	26,033	$23,348,107
Selangor	14,297	10,577,417	13,760	12,339,477
Negri Sembilan..	2,065	1,524,958	1,739	1,562,062
Pahang	2,421	1,795,405	2,617	2,345,825
Total	43,863	$32,438,488	44,149	$39,595,471

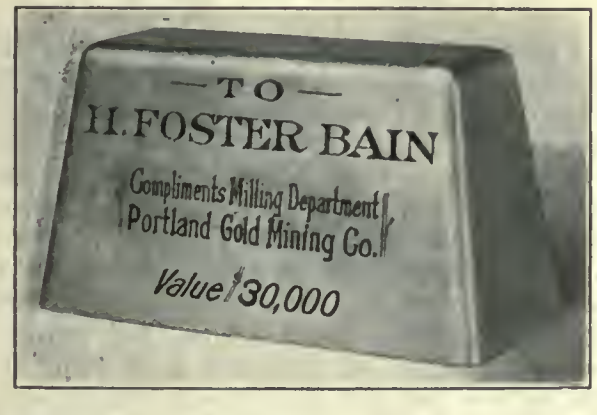
These figures show a slight increase in quantity over 1910 and a substantial increase in value. The average price per picul (133⅓ lb.) for 1910 was $44.03, as compared with $53.34 for 1911. Production in Perak and Pahang increased 3.8% and 8.1%, respectively, and in Selangor and Negri Sembilan decreased 3.75% and 15.76%, respectively. In 1897 practically the same quantity of tin was exported at an average price of $20.45 per picul, as compared with $53.34 for 1911. With the exception of a sudden drop in February and a decline in September, the market was fairly steady, with a tendency to rise. The average price was $2.44 higher than any previous record, and there was little or no evidence of local speculation. The total labor force employed in the tin mines was 196,427, an increase of 26,066 over 1910, distributed as follows: Open-cuts, 150,439; underground, 15,107; hydraulic and *lampan*, 30,881. Laborers employed on the tribute systems numbered 107,993, as follows: Chinese, 189,010; Indian, 4626; Malay, 2577; other, 214. The total horse-power of steam, hydraulic, and electrical plant employed in tin-mining was 20,623 (as against an estimated 18,515 in 1910), distributed as follows:

State.	Steam	Steam-electro	Hydraulic	Hydro-electric ...	Suction gas	Oil engines	Total .....
Perak	4593	1663	5669	1500	1363	335	15,123
Selangor	3282	....	343	....	....	...	3,625
Negri Sembilan.	233	....	331	....	200	...	764
Pahang	718	....	136	....	....	257	1,111
Total	8826	1663	6479	1500	1563	592	20,623

Gold Bricks by Parcel Post

Not long ago we published an innocent little paragraph urging wider use of the parcel post and calling attention to the opportunities it afforded for re-establishment of the fine old custom of country subscribers presenting the editor now and then with fruit and other products of the farm. It was a good custom. Many an editor, if we may believe printed records—though as to that there is admitted difference of opinion—was saved from near starvation and, by the same token, many a farmer achieved contemporary if evanescent fame. As a boy, we always wished we were in the editorial chair during watermelon season. Development of the modern newspaper, with its large circulation, has brought many changes, and none are more marked than the obscuration of the personal relations between editor and reader. Joking aside, we regret to see this, and we hope that the bonds, if somewhat intangible, are still strong as between readers of the *Mining and Scientific Press* and its editorial staff. That there is such a thread of human interest tying us together, is indicated by the following letter received from G. M. Taylor, manager for the Portland Mining Company, and incited by the paragraph aforementioned.

"We do not deal in fruit and chickens, but make the goods that buy both, and the boys are remembering you by parcel post. We are surprised that such a well known Editor, of such a popular magazine should be overlooked by his country subscribers, and also that the Editor in calling attention to the oversight should express himself as content with fruit and chicken. We consider from the dignity of the profession your journal so ably represents, that you are entitled to 'High-Grade' or gold bricks, and as we deal in the latter exclusively, the mill boys are today trying out the parcel post with a $30,000 gold brick, which they ask you to accept with their



compliments." We present herewith a picture of the brick, which, with the letter, naturally aroused visions of wealth. The brick, on arrival, proved to be of suspicious lightness, and we have been unable to cash it in, even at usual discounts for high-grade. Neither the Mint nor the so-called Smelter Trust has shown any desire to purchase, though the value, as shown above, is plainly marked on the brick. We are forced to conclude that indeed "all is not gold that glitters." However, when one is gold-bricked, it is a pleasure at least to know that the job has been done so artistically.

Copper Producers' Association Report

The Copper Producers' Association statement, March 8, shows a decrease during the preceding month in accumulation in this country of 896,134 lb. The details are as follows:

	Pounds.
Stock of marketable copper of all kinds on hand at all points in the United States, February 1, 1913	123,198,332
Production of marketable copper in the United States from all domestic and foreign sources during February	130,948,881
Deliveries for consumption, February	59,676,402
Deliveries for export, February	72,168,623
Stock of marketable copper of all kinds on hand and at all points in the United States March 1	122,302,198

The changes in surplus in the last year have been as follows, in pounds:

	Increase.	Decrease.
February, 1912	.....	3,301,944
March	.....	572,431
April	2,927,829	.....
May	.....	15,450,386
June	.....	5,280,639
July	5,945,416	.....
August	.....	3,579,046
September	16,364,213	.....
October	13,679,380	.....
November	9,419,095	.....
December	19,148,523	.....
January, 1913	17,885,770	.....
February	.....	896,134

The Cost of Copper

Interesting comparisons between the cost of producing copper in Michigan and in the West were recently made by James MacNaughton, general manager for the Calumet & Hecla Mining Co., on the occasion of a dinner given, as related by our Houghton correspondent, and were published in the *Boston News Bureau*. Mr. MacNaughton divides copper producers into four groups: The Michigan group, consisting of the copper mines in the upper peninsula of Michigan; the Montana group, consisting of the copper mines in and about Butte; the porphyry group, consisting of the porphyry mines of Utah, Nevada, and Arizona; and the southwestern sulphide group, consisting of the sulphide mines of Arizona and Mexico. Continuing, he says:

The most recent statistics available are those for the year 1911 and even they are not quite complete, but the figures I will quote cover a product of approximately 1,000,000,000 lb. of copper for the four groups mentioned, out of a total of about 1,400,000,000 lb. produced and imported into the United States for that year. Comparing the yield per ton of rock or ore treated, we find that the Michigan group gives an average of 20¼ lb. per ton; the Montana group, 61¾ lb.; the porphyry group, about 22 lb.; and the southwestern sulphides, 74½ pounds.

It would be extremely difficult to make a comparison of the amount of work expended in mining

and milling the average ton of rock or ore in each of these groups, but it would seem that on account of the great depth and the narrowness of the lodes the Michigan district would afford the most difficult mining; Montana would undoubtedly come next, with the southwestern sulphides third, and the porphyry mines last or the easiest to mine by reason of their large surface deposits permitting in most instances the use of steam-shovels, and the shallowness of deposits worked underground.

During the year 1911 the total average cost per ton treated in each of these groups was as follows: Michigan group, $1.86; Montana group, $7.84; porphyry group, $2.22; southwestern sulphide group, $8. It should be borne in mind, however, that in the Montana, porphyry, and southwestern sulphide ores quite large amounts of the precious metals are recovered, which is credited to the cost of producing a pound of copper; whereas the value of precious metals recovered from mines in the Michigan group is almost negligible. In the Montana group, for instance, the precious metals for the year 1911 amounted to 3.26c. per pound of copper produced; in the porphyry group the precious-metal value was 2.18c. per pound of copper produced, and in the southwestern sulphide group, 1.17c. Applying these credits, the following comparison of the net cost of producing a pound of copper may be made: Michigan, 9.19c.; Montana, 9.44c.; porphyry, 7.98c.; southwestern sulphide, 9.03c. From this it can be seen that if it were not for the precious-metal values in the other groups, the Michigan group would be the lowest cost producers; or, in other words, if the comparison is made on the basis of copper alone and no credit is given for the precious metals recovered, the results would be as follows: Michigan group, 9.19c.; Montana group, 12.70c.; porphyry group, 10.16c.; southwestern sulphide group, 10.25c. The average net cost of producing this pound of copper is 8.96c. Michigan, Montana, and the southwestern sulphide averages are slightly in excess of this figure, which indicates that the real competition in copper production is furnished by the porphyry mines.

It has been argued that the costs published by some of the porphyry mines are not wholly correct, inasmuch as certain charges, such as 'stripping account,' have been deferred, and that the published costs are lower than they should be. It is not to be presumed, however, that the intelligent men in charge of these properties are either fooling themselves or attempting to fool the public, and for the purposes of this discussion, at least, their figures should be given due consideration.

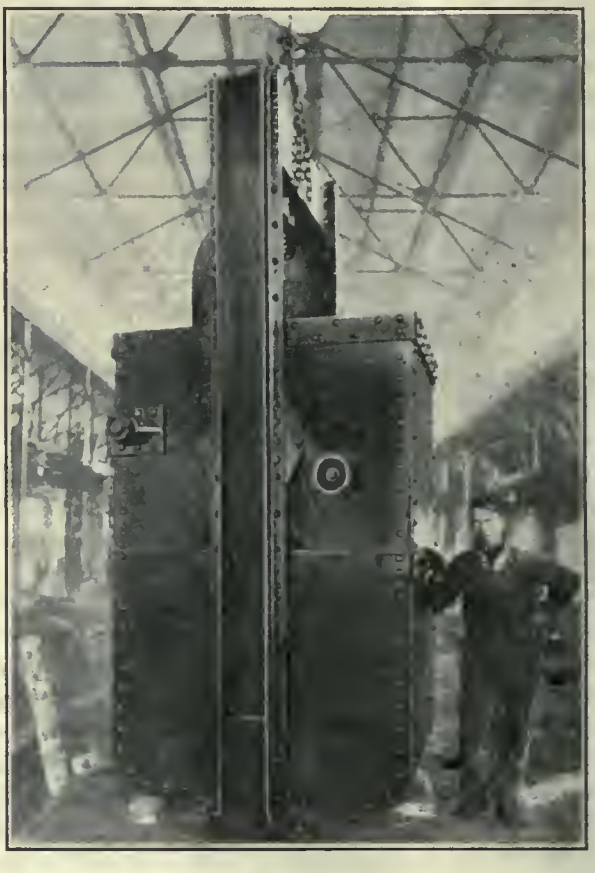
Australasian Gold Yield in 1912

According to the *Australian Mining Standard*, the gold yield of Australia and New Zealand was as follows, in fine ounces:

	1911	1912.
New South Wales	181,121	165,295
Queensland	381,845	346,390
Tasmania	31,100	40,264
Victoria	503,541	480,131
Western Australia	1,370,816	1,282,651
New Zealand	427,707	316,667

A Big Skip

The accompanying photograph shows the 140-cu. ft. skip recently made for the Hancock Consolidated Mining Co. by the Lake Shore Engine Works at Marquette, Michigan. Hancock's big vertical shaft, sunk to strike the Quincy lode at depth, has been



a matter of considerable interest in copper-mining circles. The skip's approximate size and construction are apparent from the picture.

Testing Cyanide Solutions

A good test of cyanide solutions, devised by Mr. Dowsett of the Brakpan mill, Johannesburg, to determine whether precipitation on zinc dust or shavings is good, is as follows: 1000 c.c. of cyanide solution is poured into a wide-necked bottle, to this is added three drops of saturated solution of lead acetate, and the mixture is then shaken. Add 0.75 gm. of zinc dust and shake again. Add 20 c.c. of saturated solution and shake for 30 seconds. Pour into an evaporating dish and allow dust to settle. Pour off solution, put dish on a spirit lamp, and dissolve zinc dust with about 10 c.c. of aqua regia; boil this until the bulk is reduced to a volume of about 4 c.c. Allow the chloride of lead to settle, and then pour the solution into a test tube. Cool the solution in the tube, and add two drops of a solution of tin chloride. If gold is present to the extent of 0.02 dwt. per ton of the original cyanide solution, a very slight coloration will be perceived in the liquid; 0.03 shows a slight yellow; 0.04 slight pinkish yellow; 0.06 strong pink; 0.08 the purple of Cassius. The great advantage of a test of this nature lies in the fact that the shiftsman can make it in a few minutes.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Secretarial Ethics

The Editor:

Sir—Enclosed please find a copy of a letter to me from Charles F. Rand, president of the American Institute of Mining Engineers, which is a conclusive reply to the direct and inferred criticisms, so far as they refer to me, appearing in the editorial notice in your issues of January 25 and February 8, 1913. I respectfully request, as a matter of justice, that you will publish this present communication and the letter from Mr. Rand in an early issue of your paper.

JOSEPH STRUTHERS.

New York City, March 5.

Dr. Joseph Struthers:

Sir—Your letters of February 21 and 24 have been received, together with copies of the *Metallurgical and Chemical Engineering* of September 1912, the *Mining and Scientific Press* of January 25 and February 8, 1913, and the *Engineering and Mining Journal* of February 8, 1913, in which latter the suggestion is made that you demand an investigation: with the request on your part that the criticisms appearing in these publications as far as they relate to you should be considered by the Board of Directors or the Executive Committee of the Institute. Your letters and the accompanying newspapers have been carefully considered by the Executive Committee.

We are very glad to state that no charges of any kind against you are in existence before the Board. Your accounts as assistant treasurer have been audited annually by a firm of certified public accountants and always found correct. As to the excursions which are specifically referred to by the *Mining and Scientific Press*, you are entitled to the statement which we very gladly make, that you did not originate the system by which such excursions were conducted. The system had prevailed for many years, and before you became connected with the administrative work of the Institute.

With regard to the reference in the *Mining and Scientific Press* to the New Haven and Spokane meetings, we now find that there was no Institute excursion connected with the New Haven meeting, and understand that you had no financial relation beyond the receipt of salary and expenses to the excursion connected with the Spokane meeting. Both of these meetings were held while you were assistant secretary and before you became secretary of the Institute. A committee of the Board and Council has already inquired into the conduct of the excursion to Japan which was under your charge, and exonerated you, as shown in a report which has already been published.

As to the letter of Messrs. Corning and Stone, published in *Metallurgical and Chemical Engineering* last September, we appreciate the position taken by Dr. Raymond and at the urgency of your friends, to abstain from any newspaper controversy which might be harmful to the Institute. At the same time we are pleased to say, concerning the general charge which might be construed to include you, that you have not received an excessive salary and that you have not been inefficient in the office work.

The Executive Committee consists of Charles F. Rand, Benjamin B. Thayer, A. R. Ledoux, Joseph W. Richards, and James F. Kemp.

Yours very truly,

CHARLES F. RAND,
President, Amer. Inst. Min. Engineers.

New York, March 5.

[We take pleasure in publishing the above. The reference to excursions to "New Haven and Spokane" was taken from the report of the Committee of Five, a printed document distributed by the Institute while Mr. Struthers was secretary. The report on the Japan excursion has already been printed in full with our comment. There has never been any charge that Mr. Struthers was the originator of the system of which complaint was made, merely that he was a beneficiary. We are sincerely glad to know that in case of the Spokane excursion he had no financial interest. It is always a pleasure to find circumstances capable of a pleasant interpretation rather than the reverse.—EDITOR.]

The Intermittent System of Cyanidation

The Editor:

Sir—An article under this title appearing in your issue of February 8 will stand a little analysis. In it L. P. Hillis describes a lift-pipe for Pachuca agitators which has been patented and in use for some time. It probably has all the good points that he claims for it. Possibly by using the form of lift-pipe described, thickening before agitation could be avoided, but whether sufficient saving in cost of plant and operation would result to justify the installation of increased agitator capacity which would be necessitated by settling and decanting in Pachucas, is decidedly questionable. Further, Mr. Hillis has not calculated the number of washes which would be required to reduce the value of the solution in his agitators to a point where the agitator charge could be discharged to waste. Assuming the following conditions: A recovery of $10 per ton of ore, battery solution $1 per ton, milling solution ratio 6 to 1, recovery in milling 40%, thickening in agitator from 6 to 1 to 3 to 1, agitation to recover 60% remaining in the ore, thickening to 2 to 1 in agitator, and diluting to 3 to 1 with barren solution *ten times*, there would still be $0.14 dissolved gold per ton dry in the charge. Mr. Hillis naively claims for a plant designed according to the description in his article, "simplicity, cheapness of installation, economy of power and labor, low maintenance cost, flexibility of operation." I don't question the simplicity. The article under discussion was evidently to once and for all settle the question of intermittent *v.* continuous agitation in favor of the former. Its author directs his broadside at the

Pachuca agitator while ignoring flat-bottomed agitators entirely. It will not be long before Pachucas are a thing of the past, and one of the salient features of the flat-bottomed agitator is its adaptability to continuous agitation. By regulating the height of discharge, any desired concentration of coarse and quick settling particles can be secured. In any agitator containing a known tonnage of quick settling particles and having a known feed per hour of same, the hours of agitation of quick settling particles is determined by dividing tonnage by feed. By regulating height of discharge in a flat-bottomed agitator the former can be controlled, allowing time of agitation to be nicely adjusted. There remains, of course, the fact that some quick settling particles will escape untreated from the first agitator, but assuming four or more agitators and applying the law of probability and chance, it can be readily determined that all particles with the same settling rate will be to all intents and purposes equally treated. Regulation of time of agitation upon the basis of settling qualities can be readily obtained in any flat-bottomed agitator, especially the Dorr agitator, with its central lift. The saving in labor of continuous over intermittent agitation cannot be questioned by anyone who has used both, and properly designed continuous agitation plants allow a number of nice adjustments impossible in using the charge system.

Taxation of Mining Claims

The Editor:

Sir—In answer to the article on the taxation of mining claims appearing in the *Mining and Scientific Press* of February 15, I suggest that if M. H. Joseph will visit some of the best camps in Nevada and note the many valuable properties that have been lying idle for the past twenty years or more as a result of litigation, poor management, or being held by some rich corporations or individuals who are absent, and who in all probability will never work them again, thereby keeping the state from its revenue and others from working them, he will form other opinions in regard to the new law. In the seven years that I have prospected in Nevada I have visited many of the old camps and have noted the stagnation of the mining industry due to absent owners who hold under patent the best properties and deprive the prospector of the lands which, if turned back to the Government, would, in time be re-located and worked. The Government in the first place should not issue a patent to mineral ground, but should require the locators to do a certain amount of development work, and if the property cannot be made to produce, or upon their failure to keep up the required amount of work, the land should revert to it and be open for other prospectors. These may in the course of time discover ore that had been overlooked by the first locators.

Mineral ground is only good for what wealth it can produce, and when it fails to produce or pay a revenue it should not be held under patent to the detriment of the prospectors and the state. If the old law is allowed to continue for another generation, there will be no field for the prospectors in the West; and without the prospector, what would our mineral industry be? Who discovered all of our great mines? And who are the parties that now hold patent to the ground that has slumbered peacefully for the past twenty years?

J. E. GRIFFITH.

Atlantic City, Wyoming, February 21.

Progress in Gold-Silver Ore Treatment in 1912

The Editor:

Sir—I should like to amplify a sentence in my annual review regarding the Nissen stamp to read: "but the amount of business up to the present given by the Rand to the inventor would probably not pay his traveling expenses, and if ever the Nissen stamp is adopted by the Rand at its mills yet to be designed—*other than by the group responsible for presenting these results so frankly and freely to the industry*—it will be because of the enterprise of Rhodesia in widely adopting it." Addition of the words italicized will make my meaning more clear.

The policy of the Corner House in giving the industry so frankly and fully details of the results of the Nissen stamp stands out as all the more commendable in face of the policy of secrecy of the Mines Trials Committee on which I animadverted. May I venture to prophesy that the Corner House will be no loser by its generosity and enterprise? When the time comes for it to design new mills it will in the same way receive the benefit of the experience of the many extra-Transvaal mines that have already adopted the Nissen stamp on the City Deep results.

ALFRED JAMES.

London, February 20.

Starving New Properties

The Editor:

Sir—The *Mining and Scientific Press* often brings accounts of old abandoned mines being reopened. This naturally involves the expenditure of large amounts of money for dewatering, retimbering, and other expenses. The claim-owner with promising property, one which has produced shipping ore on the surface, but which he is unable to develop because of the necessity of sinking, wonders why it is so hard to interest capital in undeveloped property. He is inclined to blame the mining engineer for this state of affairs, because of not using his influence in directing capital to new prospects.

A fraction of the money expended on some of these old mines, mere shells in some instances, would often produce a healthy youngster of a mine that could stand on its own merits for further development. The tendency now seems to be to starve the infant in order to prolong life in old age.

F. M.

Wisdom, Montana, February 10.

[In extensive workings, there is opportunity to study a vein not afforded by a shallow prospect, but it would be a pity to lose sight of the fact that prospects must be developed or there will be no mines. —EDITOR.]

Special Correspondence

NEW YORK

MARKETS STILL WAITING.—FEBRUARY PRODUCTION.—AMALGAMATED FINANCES AND IMPROVEMENTS.—BUTTE & DULUTH LEACHING SUCCESSFUL.—PITTSBURG SILVER PEAK EARNINGS.

Wall Street's waiting attitude, which has become chronic during the past three or four years, was, for the moment, interrupted by the change of administration at Washington, but almost immediately relapsed into the previous position. The 'Street' is now waiting to see what the new administration intends to do and what, if anything, may be done that will have a market effect. The copper-metal market has been for the most part featureless, the bottom in price having apparently been reached at 14¾c., and as nearly as figures can be collated from the various selling agencies, some 125,000,000 lb. of copper has been disposed of during the past fortnight. February having been a short month, and as expected the report of the Producers' Association showing a decrease (896,000 lb.) in accumulated stocks, the copper-share market has suffered more by reason of the general dullness prevailing than the statistical position of the metal; in fact, copper shares have not moved up or down in response to metal movement. In July of 1910 the copper surplus was at the highest figure ever reported, 401,249,967 lb., and after a severe decline in the market, the average price of 34 leading copper stocks was $48.11 per share. At that time copper was selling at 12¾c. per lb. as compared with the present selling price of 15c. Recent compilations show that notwithstanding the present improvement in price and reduction in surplus, the same 34 leading copper issues today figure an average of about $42.85. Reported production of various copper properties for February is as follows: Braden Copper Co., 1,600,000 lb.; Anaconda, smelter output, 21,250,000 lb.; Chino, 4,014,735; Miami, 2,817,000; total Phelps-Dodge output, 11,230,897 lb. The Shannon Copper Co. produced 1,152,000 lb., which may be compared with 1,232,000 lb. in January and 1,300,000 in February 1912. The Shannon output is aided by precious metals contained. These amounted in February to 250 oz. gold and 8700 oz. silver.

The United Copper Securities Co. and Arthur P. Heinze, who is a brother of F. Augustus Heinze, are complainants in a $30,000,000 damage suit brought against the Amalgamated Copper Co. and its subsidiaries, including the Anaconda; the executors of the estate of Leonard Lewisohn, William Rockefeller, H. H. Rogers, Jr., John D. Ryan, and James Stillman, are individual defendants. The suit is based on some old matters of the Montana Ore Purchasing Co., which latter has just been included in the receivership of the United Copper Co. The Amalgamated Copper Co. has just sold to the National City Bank $12,500,000 two-year 5% notes, the proceeds of which will be used to take up a note of like amount issued in March 1911 to pay for the stock of the United Metals Selling Co. which was purchased at that time. B. B. Thayer, president of the Anaconda Copper Co., just recently returned from Butte, says in a recent interview: "The changes which we have been making in supplanting steam with compressed air are progressing well, and while it is too soon to figure the actual saving, I can say that as a whole the work is giving entire satisfaction. In all departments we are continually striving toward greater efficiency and lower cost." A. B. Wolvin, long identified with the Butte & Superior, is said to be jubilant over the results obtained by the leaching plant erected at the Butte & Duluth property, in which he is the principal owner. J. D. Fields, the engineer under whom the plant was constructed and who is now in charge of its work, is authority for the statement that he can produce pure copper direct from the ore at a cost of 5c. per pound. The leaching plant is to be immediately enlarged from a capacity of 250 to 1000 tons per day. A similar plant is being erected at the Builwhacker.

The feature of the outside market has been the sharp advance in Cobalt shares, though it must be said at the same time that the advance in New York was scored without any inrush of public orders. The Pittsburg Silver Peak Gold Mining Co., operating at Blair, Nevada, reports gross earnings for the year of $1,180,307, an increase of nearly $500,000 over the year preceding. The net produced from the above was $239,754; dividends paid during the year last past totaled $502,871. There was carried forward to surplus the sum of $254,706.

TORONTO, CANADA

HOLLINGER OUTPUT.—COBALT LAKE.—DRUMMOND.

The last few days have been characterized by a rapid upward movement and heavy transactions in Porcupine stocks, due to favorable official statements from the Hollinger mine. According to the report of the president and the general manager, sent out with the checks for the dividend due February 15, production during the two weeks previous exceeded considerably the weekly output before the strike. For the week ending February 4 the product was valued at $65,005, and for the week following at $59,313. Prior to the trouble the output ran in the neighborhood of 1900 tons per week, valued at about $50,000. On February 13 there were 35 stamps running, and it was anticipated that 40 would be in commission within a few days. Regarding development, the manager states that two parallel drifts, 35 ft. distant, are being run south through the low-grade body found on No. 1 vein at the 300-ft. level. The metallic content has been steadily increasing, until it now runs from $16 to $23 per ton. At the Dome the mill of 40 stamps has for the past nine months been treating 10,000 tons per month. Development at the 260-ft. level of the Golden Stairway vein has resulted so favorably that it has been decided to increase the capacity of the mill by adding at least 40 and perhaps 60 stamps. The Jupiter property is being unwatered in order that development may be resumed as soon as possible. The shaft will be put down to 500 ft. A new compressor plant and electric transformer have been ordered. At the McEnaney, rich ore, stated to run $48 per ton, has been found at the fourth level, where the vein has widened from 4 to 8 ft. On the 200-ft. level the vein is being opened up for 550 ft. in ore running upward of $30 per ton. The management has therefore decided to enlarge the 5-stamp mill recently started to 20 stamps and to build an addition for cyanide treatment. The Dome Lake is putting in a 10-stamp mill, which will shortly be in working order. Smelter returns from a shipment of 10 tons sent some time since from the Tough claims in the Swastika district show gold content to the value of $10,453 in addition to silver worth $300. Another shipment of rich ore has been sent out. The richness of the deposits in the Kirkland Lake area of the district where these claims are located is attracting much attention, and several locations have recently changed hands, including the Wright-Hargraves in which Albert Wende, of Buffalo, and associates have purchased a three-eighths interest.

The Cobalt Lake had a record year in 1912. On December 31 the company had a surplus of $425,947 as compared with $80,847 the year before. An initial dividend of 2½% was paid in January. The production was 1,123,147 oz., and the ore reserves are estimated at 2,135,040 oz. With the payment of the regular and extra dividends declared by the Buffalo amounting to 23%, that company will have returned to its shareholders an aggregate amount of $2,107,000, or more than twice its capital. The annual report of the Seneca-Superior showed net profits of $121,618 and a surplus after paying a 10% dividend of $73,980. The north vein discovered in October has been developed for 213 ft., showing an average value of 3500 oz. per ton for this distance. The ore reserves are estimated at 1,150,000 oz. The annual report of the Trethewey showed net profits of $338,640, and a surplus of $178,743. The ore reserves were estimated at 590,624 oz. Negotiations are on foot for the sale of the property to English capitalists for a price stated at $750,000. The Casey Cobalt mill of 10 stamps will be enlarged this summer by addition of 10 stamps. Active

operations have been resumed at the Wright claim, which is being worked by the Pan Silver Co. The Silver Cliff has been purchased by R. C. Wigmore, of Toronto, and is being reopened with W. H. Jeffrey as manager. Drilling has been started on the Alexandra property to pick up the Balley vein. The Drummond is taking out large quantities of milling ore from an extensive orebody on the 125-ft. level, keeping 20 stamps of the Northern Customs concentrator running at full capacity. The Penn Canadian has cut a vein of high-grade ore 5 in. wide, on the 150-ft. level, and is taking milling ore from the lower levels.

BOSTON

Market Tone Better.—Calumet & Hecla and Tamarack.—Severe Weather Limits Copper Production.

Stock market interests in Boston received Mr. Wilson's inaugural message with evident satisfaction, and there seems to have been a change for the better in sentiment since March 4. An experienced Boston financial editor said the other day in private conversation that he believed the enactment of a 'blue sky' law in Massachusetts would result in mining stocks of the better class having something closely resembling a boom, as, under the construction of the law now under consideration, mining securities would be the only kind appealing to the universal gambling passion which would be at all eligible.

The Calumet & Hecla management is trying hard to bring the average recovery of the Tamarack conglomerate rock up to that of the district, 1%, or 20 lb. per ton. It is now a trifle better than 19 lb., and the management hopes in the next two months, since the ore in No. 3 shaft is showing a slight betterment at greater depth, to make up the difference. The decline of 3c. per pound in copper placed Tamarack in the doubtful column again. Last year, when copper sold up as high as 18c. per pound, Tamarack was returning to favor and, as a matter of fact, when its annual report is issued, will show net earnings for 1912 of between $5 and $6 per share. Tamarack, with its deep shafts and lean ore, is not of much value, with copper selling at its present price. Its cost has ranged over a term of years from 12 to 16c. per pound.

New England has had such a mild winter that it is difficult for people living here to understand the exceptionally severe conditions which have existed in the copper districts of the West and Southwest. At Globe, Arizona, the mines have been subjected to the severest weather ever known. During the greater part of February they have been practically closed because of lack of supplies. Spinal meningitis and smallpox broke out in Globe and a mild quarantine had to be instituted. At Bingham and Ely the heavy snows have greatly retarded copper production, and right upon the heels of a strike last fall. The effect of the curtailment is now being felt in the metal market. The directors of the Cortez Associated Mines were to have held their annual meeting a few days ago, but it was postponed for 60 days on account of failure to get news through the lines because of the Mexican hostilities. The company is reopening old shafts on an abandoned property lying in the Jacala district, Hidalgo, Mexico.

DENVER, COLORADO

Eagle and Platoro Divide Attention.

Discoveries at Eagle continue. Two additional prospects have been reported, and W. A. Gesner has found rich ore at the Sunnyside mine, about three miles east of the main district at Horse mountain. R. D. George, State Geologist, has furnished helpful data on the new district and has pointed out that there are a number of points at which conditions are favorable for finding additional veins. The ore is in sandstone of Mesozoic age and the silver is mainly in the form of chloride. Analysis shows the presence of as much as 1% of vanadium and the formations correspond to those in southwestern Colorado from which vanadium is now mined. There are basalt dikes in the district, but their relations to the ore are not yet known. These discoveries in Eagle county have detracted somewhat from an earlier interest in Platoro in Conejos county, where last October a 2-ft. streak of quartz containing gold tellurides and reported to assay $700 per ton, was found in territory previously considered barren. A number of men are now working on the vein and ore is being sacked for shipment. Altogether Colorado mining men are feeling more cheerful than for several seasons.

BUTTE, MONTANA

February Production.—Butte-Ballaklava Litigation.—Barnes-King Improves Position.—Labor Legislation.

The Anaconda Copper Co. mined 280,000 tons of ore in February, an average of 10,000 tons per day that yielded after treatment better than 62 lb. of copper per ton of ore. North Butte mined about 9000 tons, yielding 110 lb.; Tuolumne mined 4200 tons, yielding 120 lb.; Alex Scott mined 6000 tons, yielding 110 lb.; Davis-Daly mined 1700 tons, yielding 110 lb.; this makes a total of 325,000 tons of ore, yielding 22,000,000 lb. of copper. February production was light, owing to cold weather, mine fires, and a short month, but better than 12,000 tons per day of 4% ore and is not so poor at that. The Butte-Ballaklava Copper Mining Co. has received a setback in its litigation with the Anaconda Copper Mining Co. by the decision of the Silverbow County Court denying a change of venue. The Ballaklava company is expected to appeal from the decision. The annual meeting of the Barnes-King Development Co. was held at Lewiston, March 6. The old directorate was reëlected entire. The outlook for the company is better than at any stage in its history. The mine at Kendall is producing steadily, and the prospects of the Plegan-Gloster at Marysville are good. The time may yet come when the disgruntled stockholders can no longer cry 'Barnes-Skin' for Barnes-King.

The labor element made a hard fight for a compulsory compensation law in the legislature just closed. Their demands were so sweeping, however, that nothing was accomplished. A conservative compensation law would protect both employer and employee, but compulsory compensation regardless of the culpability of the injured, must certainly be regarded as class legislation. The question is likely to be brought forward again at the next legislature.

FAIRBANKS, ALASKA

Proposed Power Plant.—Active Quartz Mines.

J. L. Timmins, who is promoting a power scheme to supply power to the Fairbanks district, has just left town for the Tatlaneka, where the plant will be erected if sufficient power consumption is guaranteed. The plant, if built, will have a capacity of 10,000 kw., and, while using water-power in summer, will burn coal in winter. Abundance of water-power and coal make the Tatlaneka a suitable place for the plant. While much encouragement has been given Mr. Timmins, he will make no definite announcement of plans until his return. The increasing number of small mills and the large amount of low-grade placer ground that could be worked with cheap power and supplies would seem to justify the erection of such a plant, especially if the proposed government railroad becomes a certainty.

The first mill-run from the Teddy R. claim on Fairbanks creek, now held under lease and option by Pomeroy, Ford & Wheeler, proved encouraging to the lessees. Nineteen tons netted a bar worth $480, or an average of $25 per ton. All rock broken was sacked and milled, no attempt being made to sort the vein matter. The tailing assayed $6, bringing the average value up to $30. The ore was milled by the Chatham Mining Co. at its mill on Chatham creek. The absence of a concentrating-table at this plant explains part of the loss in the tailing. The Newsboy mill crushed a shipment in January from the Overgaard lease at the head of Willow creek. The bar weighed 55 oz., showing the ore to average about $30 per ton. This claim is owned by Louis Golden and Henry Ott. The first fairly large

mill-run from the Homestake was also run at the Newsboy mill the same month. The run netted 114 oz. of bullion, worth $16.52 per oz., showing the rock to average $75 per ton in free gold. The concentrate, of which there is a considerable amount, shows 360 oz. silver per ton and $72 in gold. The company has engaged C. M. Nicholson as engineer and will start extensive development. The ore was taken from the vein found about 350 ft. from the mouth of the tunnel and which was at first thought to be only a small stringer. The vein has widened to 10 in. and the pitch of the hill gives about 200 ft. of backs at present, while driving will increase the backs rapidly. The Homestake mine is at the extreme head of Wolf creek.

The Chena customs mill crushed from 300 to 400 tons of ore from the Rainbow mine on Skoogy gulch, early in February. The first 140 tons showed $15 in free gold with $5 in tailing and concentrate, but the last of the run was expected to bring the average close to $30 per ton. Extensive sampling of the mine and dump justifies these expectations. Roth & Maddocks, half owners of the property, will operate the mine for the present. A loading bin at Gilmore has been built to facilitate loading the ore on the cars of the Tanana Valley railroad, which delivers direct to the mill. Joseph Henderson is the new foreman and superintendent at the Rhoads-Hall mine on Bedrock creek, Allan Cunningham having resigned to take a position with the Rexall on Wolf creek. Sinking of the winze has proceeded until the water can barely be handled by the pump, and a level will be run and stopes opened before sinking is started again with the arrival of a new

RHOADES-HALL MINE.

pump. The vein seems to be as strong in width and value of the ore on the lower level as in the main adit. The mill is running steadily on good ore. The 2-stamp mill at the Rexall mine at the head of Wolf creek is now in operation, and the first clean-up was brought into town early in February. A good water-supply is assured, and the mill should crush steadily from now on. Allan Cunningham is the engineer in charge, while the property is owned and worked by George Horton & Co. It is reported that the owners of the Chatham Mining Co. are jubilant over the last clean-ups, the ore improving materially in grade. The 4-stamp mill is in constant operation. L. C. Hess has recently bought an interest in the property, which includes a large number of claims at the heads of Chatham and Fairbanks creeks. Driving on the 315-ft. level of the Newsboy seems to have resulted in discovery of the ore-shoot looked for, as assays have been made showing $20 rock in the east face. The vein here is large and the finding of the shoot materially increases the value of the property. The last clean-up for January netted 167 oz. of bullion at $17.07 per ounce. A lease and option on the Governor claim has been taken by Heys, Larson & Ellis from Cook Bros. and other owners. This claim was staked and named the day the governor, W. E. Clark, visited the creek, and considerable development work has been done since. A new shaft will be sunk and a boiler and hoist installed as soon as necessary. A lease has also been taken on the North Star, another claim in the same group, by Reichert & Ashton. Cook & Lundblad, the owners, are also working on another part of this claim. Enough high-grade rock has been found to warrant extensive development. After doing other assessment work, Cretes & Fallman are again busy driving their adit on the Helen S. claim. A broken-up and faulted portion of the vein has been passed and the solid rock again found. No mill-runs have been made, but the amount of free gold visible in the ore guarantees good returns. Big offers have been made for this claim and rejected by the owners, who figure on having a big producer by next season. So far, fully 200 ft. of adit has been run.

PHILIPPINE ISLANDS

Talk of Independence Scares Capital.—Gumaus Dredge Doing Well.—Quartz Mining Not Active.—Iron and Oil Discoveries.

The mining industry in the Philippines has received a number of set-backs in the past. At the present time, it is in a fair way to receive the worst of all. The Jones bill, providing for Philippine independence, and the indiscreet remarks made by prominent Democrats in the United States regarding a question of which they know little, has all but caused a panic in local business circles. Naturally, mining comes in for the hardest blows of all, as it is the most subject to nervousness of all forms of business. It is being demonstrated beyond all doubt that the Philippine Islands are rich in minerals. It is clear to those on the ground that the crying need in the Philippines is the development of material resources. With coal and iron occurring in all parts of the archipelago, but with little development and only three or four crude blast-furnaces operated by natives, it seems a joke for the question of independence even to be brought up. Capital, which was just beginning to turn its attention to these islands, has suddenly begun to shrink away, and several important projects which would have a lasting effect upon the welfare of the Filipinos are to be passed on to the future.

The most noteworthy happening in connection with the mining industry within the last month or so has been the record returns from the Colorado mill on the island of Masbate. This mill, in the month of December is reported to have cleaned up ₱100,000. The condition of this mine and mill is at the present time exceedingly satisfactory. The most exciting event is the reported robbery of amalgam from the tables on the Gumaus dredge. This dredge, which was christened 'The Governor Gilbert,' after the Vice-Governor in the Philippines, has been making, according to all reports, excellent progress. It is fortunate to have this modern dredge, designed and constructed by the New York Engineering Co., operating in the same district with boats of the New Zealand type. It will afford an excellent opportunity to compare the merits of the two systems. There are four dredges working in the Paracale district at this time, and by April it is expected that there will be two additional ones and orders for two more will probably be placed in the near future, so that by the end of the year there may be eight gold dredges digging in the Philippines. The Gumaus company has just announced its second monthly dividend of 10 per cent.

There is no quartz mining at present in this district, but we may look for a resumption of work on the San Mauricio property within a year. The Paracale Venture Co. has installed a 50-hp. boiler and a 4-in. Cameron pump. This company is doing some driving in placer ground. The pay dirt is said to yield an ounce of gold to every yard. The shaft is 70 ft. deep. From the Benguet country, there is little news to be given, except that assessment work is being carried on. The Headwaters mine on the Antamok river is still struggling, and it is sincerely hoped that the officers will be able to pull it out of present difficulties. There has been considerable trouble in this region over the timber supply, and it is evident to those who know the district, that a deliberate 'hold-up' of some of these companies has been attempted. It is hoped and believed that the Government will take early action.

It is gratifying to record the discovery of what may be a very large deposit of chromic iron in Antique province, island of Panay, by C. Harris; also the discovery of the natural bitumen, gilsonite, on the island of Leyte. Vigorous development is being carried on in both localities.

The gilsonite deposit is reported to be in the form of a vein about 20 ft. wide. Many years ago, the Mining Bureau called attention to the possibilities in lithographic stone in the Province of Bulacan. It is reported on good authority that a Manila company will shortly open up this deposit and put this stone on the market. It has already been tried out by local lithographers and found to be of good grade. The months of February and March will see a party from the Division of Mines from the Bureau of Science at work making a geological survey of the lower end of Tayabas peninsula, where several oil seeps have been found. In the coal industry, there is little going on at present, though development is in progress in the vicinity of Mt. Uling on the island of Cebu. The East Batan coal mine has suspended operation and has been sold at auction recently to the Philippine Government. The coal is not satisfactory for steaming purposes, but is satisfactory in gas producers. The Philippine Bureau of Science is at the present time using this coal in an Otto producer.

MELBOURNE, AUSTRALIA

BROKEN HILL OUTPUT FOR 1912.—THE YEAR'S GOLD RETURNS.—A WALHALLA MINE.—VICTORIA MINISTER FOR MINES GOES TO LONDON.

The 1912 output of Broken Hill, New South Wales, broke all records. The value of mineral exported was about 35% above that for the preceding year and more than double the value of the export for 1909. Reduced to dollars, the value of the export for the past half dozen years is as follows: 1907, $14,925,000; 1908, $9,778,000; 1909, $10,073,000; 1910, 11,800,000; 1911, $15,035,000; 1912, $20,302,000. Details for the last two years are given below:

1912.	Tons.	Value.
Silver-lead concentrate	279,915	$13,430,000
Zinc concentrate	433,054	6,407,000
Silver-lead crude	29,605	432,000
Silver-lead slime	4,503	34,000
1911.		
Silver-lead concentrate	276,963	$ 9,608,000
Zinc concentrate	420,031	5,078,000
Silver-lead crude	27,355	301,000
Silver-lead slime	11,761	48,000

It will be seen by a comparison of these figures that the improvement is almost entirely in metal value. The output shows very little difference, but the value of that output has, thanks to the greatly enhanced price of metals, swelled considerably. Had a sufficiency of labor been obtainable, there would, however, have been an even greater increase in value, because there would have been an appreciable improvement in output consequent upon both the satisfactory development in the mines and the excellent prices obtainable for their products. The twelve months' dividends distributed totaled $8,673,000. One pleasing feature of the year's production is that the value of the December output more than doubled that of the output of the opening month of the year. The value of production of each of the four quarters of the year was as follows: Quarter ended March, $3,823,000; June, $4,791,000; September, $5,447,000; December, $6,063,000. This marks a steady and tolerably even advance throughout the year.

The year's gold returns are gradually coming in. They indicate that in almost every state there has been a decrease in production. In New South Wales the decrease is 15,826 oz. fine on the previous year's figure of 165,295 oz. Victoria's decrease is 23,410 oz., bringing the total for 1912 down to 480,131 oz. fine. The Queensland total is estimated at approximately 346,390 oz., and if that figure be correct the decline will be one of 35,455 oz. As Western Australia's output of 1,282,651 oz. fine means a drop of 88,106 oz., four out of the six states of the Commonwealth are seen to have a heavy fall in their gold output. On the other hand, South Australia, whose report is as usual belated, does not amount to a row of pins, but Tasmania's return is estimated at 40,264 oz., which if correct will give an advance of 9164 oz. over last year's figure.

The Long Tunnel, one of the greatest and most famous of the Victoria mines, is closing down after an existence of nearly half a century, during which, on a paid-up capital of about $250,000, it has paid a dividend of $6,224,500. The tonnage treated has amounted to 756,169 (long tons), the yield being 813,050 oz. of gold, so that the return per ton has been a shade under 21½ dwt. The township of Walhalla grew up around the mine and has been almost entirely dependent for its existence upon it and the Long Tunnel Exteuded (which ceased work some months ago). It is probable that a new company will be formed and give the famous old mine yet another trial. Those who are in favor of this action point to the fact that according to the last report of the mine manager, there was 16 in. of ore in the stopes. The chance of getting it going again on a paying basis does not. seem promising.

The appointment of T. McBride, minister of mines and railways in Victoria, to the position of Agent General for the state in London renders vacant the portfolio of mines in a state which, though not one of the chief mineral producers of the Commonwealth, is certainly one of the greatest gold producers. The general feeling in mining circles about the appointment is perhaps best expressed in the words of the *Australian Mining Standard*, which remarks sarcastically that "both Mr. McBride himself and the mines department may be heartily congratulated." He has presided over the department for a space of four years. during which time he has naturally lessened the gold output of the state by his harrassing of the holders of dredging leases. He has distinguished himself mainly by the establishment of the State Coal Mine at Wonthaggi, a venture which has so far not warranted its existence.

HOUGHTON, MICHIGAN

ISLE ROYALE DIVIDEND.—MACNAUGHTON COMPARES COSTS.

People of the Lake Superior copper country recently gave a banquet in Houghton to the officers of the Isle Royale Copper Co., now a subsidiary of the Calumet & Hecla, in celebration of the first Isle Royale dividend. The Isle Royale company owns a large tract of copper-bearing land just south of Houghton, and had operated the mine for fifty years before paying a dividend. The principal address was given by James MacNaughton, manager for the Calumet & Hecla companies. His talk was briefly as follows: "Some authority has said that it takes from eight to ten years in this district to develop and equip a mine and put it on a producing basis. While I do not know that this figure is even approximately correct, I do believe that it takes much longer to develop a paying mine in the Lake Superior district than in any other of which I have any information. So far as we can now see, we believe that the Isle Royale mine was opened too far ahead of its time; in other words, it was opened and the management attempted to make the mine earn money before the art of mining had advanced sufficiently to permit of profit being made from such low-grade rock. This also applies to other mines in the district which have only recently been made to pay, and undoubtedly there will be mines worked at a profit in this district in the future that are now being worked at a loss, for as the art of mining improves, these mines will come within the profitable limits. I believe that mining as practised here is in advance of that of other districts. The rock of the Isle Royale mine is lower in copper content than the average of that for the district, and the cost per pound of copper is somewhat higher than the average cost per pound for the district. The average copper yield per ton of rock for 1911 in the Michigan district was 20¼ lb.; if the Calumet & Hecla conglomerate be eliminated and only the amygdaloid mines be considered, the average yield would be 18 lb., while the yield at the Isle Royale for the same period was 16.4 lb. The average cost of a pound of copper for the entire district in 1911 was 9.19c., whereas the Isle Royale cost was 10.85c." Following this, Mr. MacNaughton compared costs of copper production in the Lake Superior district with costs elsewhere and showed that local costs were low. The Hancock has found a rich lode on the 3600-ft. level. It looks like the Quincy.

General Mining News

ALASKA

Fairbanks

At the present time there are about 100 teams engaged in hauling firewood to Fairbanks, and it is estimated that the annual consumption is between 12,000 and 14,000 cords, worth $8 per cord. On Fairbanks creek, on the lower part of creek claim 4 above, owned by Meehan & Larson, three lessees have put down three holes to bedrock, a depth of 12 ft., and good 'pay' has been proved for a distance of 85 ft. Pan tests show about $2.50 per square foot of bedrock. The ground is wet, and can be worked by open-cut method.

Juneau

The January operations of the mines on Douglas Island were as follows:

Valdez

Seventy-five tons of freight belonging to the U. S. Navy Department are being taken from Knik to Chicaloon, in the Matanuska coalfield. From this field 800 tons of coal

KNIK, ALASKA.

will be mined for testing purposes, and this should be ready for shipment about the end of September. From the Bering lake district 800 tons of coal was mined last fall for a trial.

ARIZONA

Cochise County

The lode at the Hoatson shaft of the Calumet & Arizona company has been proved to be 58 ft. wide at the 1200-ft. level. The Briggs shaft is 1450 ft. in depth and will be continued to 1500 ft. Fifty miles south of Bowie a large deposit of marble is being worked by the Arizona Marble Co., which has spent $250,000 in opening the quarry. Machine drills are used in mining, and polishing and finishing machinery has been installed, some of the product being shipped in a finished and some in a rough state, and traction engines hauled the marble to Olga, from which shipments are made. The company is composed of Nevada men, and J. Kerr is general manager.

The mines controlled by the Phelps-Dodge company produced 11,230,897 lb. of copper in February, of which the Copper Queen yielded 6,098,860 lb., and Montezuma 2,730,-314 pounds.

Gila County

The February output of the Miami mine was 2,817,200 lb. of copper, against 2,579,680 lb. for the same month of 1912.

Greenlee County

The Shannon mine yielded 2,152,000 lb. of copper in February, against 1,300,000 lb. for the same month of 1912.

Maricopa County

A cyanide plant consisting of four 50-ton leaching vats and solution tanks is being erected at the Relief Gold Mining Co.'s mine to treat a dump of 8500 tons of old tailing averaging $2.50 per ton in gold, and the current mill tailing. The cost of treating tailing is estimated at 65 to 75c. per ton. The mine has 50,000 tons of ore ready for stoping, average returns so far being $9 per ton.

Mohave County

The Gunn-Thompson company has acquired the Hackberry property, nine miles from Kingman. This mine was opened in 1874, and work ceased in 1884, when fire destroyed much of the plant, and the shaft caved. The ore carried from 200 to 500 oz. of silver per ton, and some gold. The dumps contain a fair quantity of ore. An incline shaft will be sunk 650 ft. at an angle of 38°, to cut the vein. T. Tighe is superintendent and 15 men are employed.

Gold has been found by W. Myers 15 miles east of Kingman, at the north end of the Wallapai mountains. The vein is said to be 20 ft. wide, and is an extension of the old Cummings mine, known as the Jonathan and Etta.

Yavapai County

A mill of 20-ton daily capacity is being erected at the Victoria mine, in the Slate creek district. The orebody in this property is of the nature of a 'stockwork,' 20 ft. wide, and is expected to yield a fair profit from the new type of mill. The Coronado Gold Mining Co. is to erect a 20-stamp mill at its mine at Rees, near Congress. The Aladdin company has leased the Postmaster and other claims of the Oriental Mining Co., of Big Bug creek, for five years, on a 25% royalty of the gross returns.

CALIFORNIA

Butte County

The cyanide plant at the Gold Bank mine is in full operation again. George Wingfield, of the Goldfield Consolidated company, has an engineer examining property at Forbestown.

Eldorado County

At 125 ft., the adit of the Marguerite mine cut 18 in. of ore last week, of which 5 to 8 in. is rich in gold. The balance of the vein will assay from $3.50 to $8.50 per ton.

Modoc County

Several mines at High Grade are being worked right through the winter. Some rich ore has been uncovered in the Sunshine Twins property, and lessees are satisfied.

Inyo County

All the electrical machinery for the Wilshire Bishop Creek mill, 18 miles from Bishop, has arrived, and the

plant should soon be in operation. Work has been delayed by snow and storms, the mine being at an elevation of 8400 ft. Grinding-pans have been installed in the mill below the stamps, and by slow grinding an extraction of 75% has been recovered by amalgamation in preliminary tests. The tailing will be treated by cyanide later on. Construction of this plant was described in the *Mining and Scientific Press* of November 2, 1912, by Algernon Del Mar, the superintendent.

SHASTA COUNTY

The Mammoth Copper Co. has taken another 5-years lease of the Original Quartz Hill mine at Old Diggings. Work will be resumed about April 1 with 75 men. This mine has a large supply of low-grade gold quartz suitable for fluxing at the Kennett smelter.

The Mountain Copper Co.'s smelter building has been pulled down by locomotives, the plant having been idle since the company transferred its operation to Martinez six years ago.

SIERRA COUNTY

(Special Correspondence.)—There is great excitement at Alleghany over the discovery of a large mass of gold quartz in the Tightner mine, which has been yielding returns of about $100,000 per month recently. The Tightner was brought to the front about two years ago by the discovery of ore that is reputed to have yielded about $500,000 gross. All that was mined was about eleven tons, though incidentally a large block of low-grade ore was developed. The mine passed to the control of A. D. Foote and associates, who found much of the reputed ore too low in grade to be of value, but who made a mine of the property none the less. They have been so successful that all payments on the property have been met as due from proceeds of the work and many improvements made. The last find justifies their confidence in the presence of sufficient high-grade ore to make the whole valuable.

Nevada City, March 10.

SISKIYOU COUNTY

Michigan people have been examining the Blue Ledge copper mines. A new adit will be driven in the Mona mine, near Yreka. The old shaft has opened the mine to 600-ft. depth, but is too far away from the orebody recently developed. The new mill of the Black Bear, in the Salmon river district, is nearly completed.

The Yreka Development Co. is opening its coal deposits near Ager. It has 3000 acres of land, and three coal seams have been discovered, and an 8-ft. seam is now being developed. J. E. Gamble is general manager.

The Supervisors of Siskiyou county are making good progress in collecting samples of ores for the Panama-Pacific Exposition in 1915. From the Homestake and Highland mines, rich gold quartz specimens have been secured, they being about one foot thick and two feet long.

TUOLUMNE COUNTY

(Special Correspondence.)—The 10-stamp mill recently completed at the Atlas mine, near Tuttletown, has been started and is working satisfactorily. A good supply of ore, some of which will go $50 to $60 per ton, and the continuation of active development work insure a long mill-run. Work was resumed at the Columbus mine this week, after a brief suspension of operation. The property, worked many years ago with success, is being extensively developed by sinking and driving, under the direction of T. G. Winwood, and some fine orebodies are being opened. The McRae mine, near Jamestown, has been bonded to N. A. Mahaffey, of Stockton, who, with others, recently began development operations at the Josephine mine, south of Stent. Work is to begin on the McRae claim within a short time.

K. Murai, of San Francisco, representing a strong Japanese company operating extensively in Mexico, has just made an inspection of the Barendgret ranch mine, near Jamestown, operated by the Manley brothers, and it is reported that the property will likely change hands. A 16-in. vein carrying heavy gold is being developed on the Pennsylvania ground, near Tuolumne, by John Sivori and Paul Casseretto, who recently obtained a lease on a portion of the property. A shaft is being sunk, and prospects are gradually improving with the progress of work.

Sonora, March 1.

COLORADO

GILPIN COUNTY

The Carr mine has been examined by A. Most. The War Dance in Russell gulch has 12 men working on company account and 10 lessees. The shaft is down 425 ft. and is being sunk a further 300 ft. Good ore is being mined from the 80, 200, and 350-ft. levels. The shaft of the Calhoun mine is down 980 ft., and the mine is being unwatered by means of a hoist.

LAKE COUNTY (LEADVILLE)

The Philadelphia Leasing & Mining Co., at Yankee hill, has started shipping sulphide ore carrying silver, lead, and zinc from a lode 7 ft. wide. Sinking the interior shaft near the breast of the Yak tunnel is finished, and stations are being cut prior to driving to the Diamond and Vega orebodies. Lessees at the Belgian, Iron hill, have opened 14 in. of ore which yields high in silver and lead, and shipments have returned $18 per ton. The Anderson adit is in 800 ft., in quartz, and a heavy flow of water is making. Lessees at the Little Ella, Big Evans, have opened 7 ft. of ore averaging $35 per ton, and in it are several streaks of ore rich in gold.

OURAY COUNTY

At the Camp Bird mine, the drift on No. 6 level, near No. 3 shaft has cut 2 ft. of ore. Last September, work was started sinking 200 ft. from No. 5 level, from where cross-cutting was started, with the above results.

IDAHO

SHOSHONE COUNTY

The high-tension transmission line from Thompson Falls, Montana, to the Iron Mountain mine at Carter, in the east Coeur d'Alene district, has been completed. There is 500 ft. of water in the mine, and the pumps are now at work. This is a lead-silver-zinc property, employing about 100 men. The Glen Metals mine shipped two cars of ore to Tooele in February, from the 700-ft. level. The King and Queen are sending out 40 tons of ore per day, and the new 75-ton mill is well under way. The Coeur d'Alene Development Co., operating the Keystone and O. R. & N. mines, has its adit in 3300 ft., and at 800-ft. depth cut high-grade silver-lead ore.

MICHIGAN

HOUGHTON COUNTY

The following is from the annual report of the Osceola Consolidated Mining Company:

Ore crushed, tons	1,246,557
'Mineral' obtained, pounds	24,282,312
Copper production, pounds	17,175,066
Revenue from copper	$3,041,408
Expenses	1,908,536
Profit	1,163,288
Dividends	1,153,800
Surplus	1,888,458
Total cost per pound of copper, cents	10.36

MONTANA

SILVERBOW COUNTY

(Special Correspondence.)—The section of the Butte & Superior concentrator which is being rebuilt along lines arranged for by D. C. Jackling, will be ready to go into commission in about two months. The section is being reconstructed in a mauner similar to the one now in operation, and which was rebuilt under the direction of Mr. Jackling. It is running to the satisfaction of the management and is treating on an average of 600 tons per day. It can be brought up to 750 tons per day, and when the two sections are running the company expects to maintain an average treatment of 1400 tons per day. The Davis-Daly company claims to be shipping 50 tons of ore per day, which is coming principally from the 1900-ft. level. The driving of the cross-cut from Gagnon mine to reach the

Silver King ground is still proceeding, but as yet there is no word of the objective point being reached, although a distance of some 2000 ft. has been covered. The object in running the cross-cut is to get under the rich ore which lessees have opened on the 300-ft. level of the Silver King. The fire in the West Colusa is now under control, the entire area having been bulkheaded. The exact amount of damage has not yet been definitely ascertained, but there is no question that it is more extensive than at first supposed. It will probably be several weeks before the mine is again in a position to be operated.

Butte, March 1.

(Special Correspondence.)—The general chemical laboratory of the Anaconda company at Great Falls was destroyed by fire a few days ago, and all the chemicals and testing apparatus was burned. For a time it was feared that adjoining buildings would also be destroyed, but the company's fire-fighters, along with a number of volunteers, succeeded in saving the property. There is a loss of about $20,000.

Butte, March 8.

The February production of the mines at Butte was as follows:

	Tonnage.	Lb. copper per ton.	Total lb.
Boston & Montana group..	92,600	65	6,019,000
Anaconda group	120,210	61	7,332,810
Butte & Boston	10,300	62	638,600
Washoe	6,300	61	384,300
Parrot	2,400	60	144,000
Trenton	10,220	61	623,420
North Butte	24,600	68	1,672,800
Butte Coalition	29,300	70	2,051,000
East Butte	9,200	110	1,012,000
Tuolumne	4,200	120	504,000
Original	8,000	60	480,000
Alex Scott	6,000	110	660,000
Davis-Daly	1,680	110	184,800
Total	325,010		21,706,730

NEVADA

Eureka County

The third new 'camp' discovered in Nevada this year is that of Lynn, situated 20 miles northwest of Corbin and north of the Southern Pacific railway. The district has been worked as a placer 'camp' for several years. The rocks are limestone and rhyolite. In the former lead is found, with gold in the rhyolite. The Big Six is sinking a shaft in rich ore, and George Wingfield has taken an option on seven claims adjoining this property for $10,000. It is stated that there are 630 people at Lynn. The weather is good, but roads are bad.

Humboldt County

At a depth of 80 ft., and in 120 ft., the Causten adit at the Crown Hills claim at Rochester has cut 4½ ft. of ore worth $104 per ton, metal content being 10% gold and 90% silver. The Nenzel Crown Point company will drive an adit 1000 ft., from Crown Point No. 5 claim under No. 4 and 3, giving a depth of 900 ft. Ore shipments from the Big Four lease continue to be sent to Oreana. The Rochester Hills Mining Co. has ordered a 60-hp. auto truck which with a trailer will carry 20 tons of ore.

Lander County

The Maricopa Mines Co.'s property is situated 2½ miles northeast of Austin, and is controlled by Cleveland, Ohio, people. It has not been operated for over two years, but at present 20 tons per day is being treated, to be increased at an early date to 50 tons. The ore carries gold and silver and is treated by amalgamation, concentration, and cyanidation.

Lincoln County

The Prince Consolidated is shipping 10 cars of ore per day to Utah smelters. The opening of the new stope on the 400-ft. level is expected to reduce mining costs, which are now $1.10 per ton, on ore delivered at Pioche. Diamond-drilling is 340 ft. below No. 5 level, in quartzite.

Lyon County

During the week ended March 5 the Mason Valley smelter received 5289 tons of ore and shipped 10 cars of matte. The Nevada-Douglas company has a number of men mining gypsum again, a contract having been made for a 300-ton daily supply. Work is to be started at the Black Copper claims, and an adit will be driven 500 ft., and a shaft sunk 500 feet.

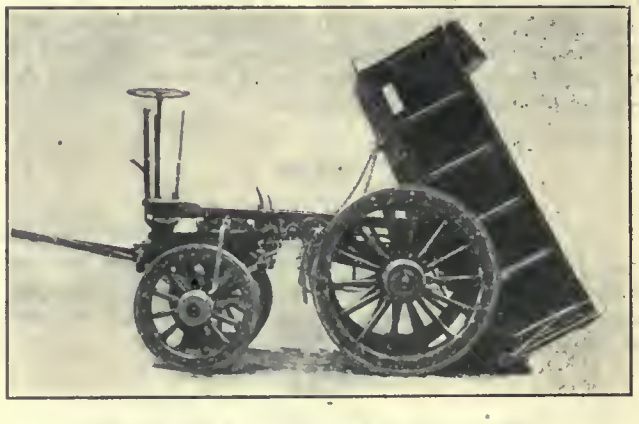
Mineral County

Lessees at various mines at Lunning are now shipping 15 cars of ore per month, containing 2.52 to 7.15% of copper.

Nye County

The new mill of the Big Four company at Manhattan started work on March 5. Construction was commenced last November, and the cost has been about $75,000. Treatment consists of a gyratory crusher, 10 stamps, 2 Akins classifiers, two 22-ft. tube-mills, and 4 amalgamating-tables, each 36 ft. in length. There is no cyanide treatment.

The mines at Tonopah produced 10,946 tons of ore, worth $232,644, during the week ended March 8, making the year's total 109,360 tons, worth $2,293,328. The Belmont company made a record shipment of bullion amounting to 90 bars of bullion, weighing 163,220 oz., this being the clean-up for the last half of February, the month's total being 10.93 tons of bullion, in addition to concentrate shipped.



TRAILER FOR AUTO TRUCK FOR HAULING ORE.

Storey County

The Mexican mill treated 531 tons of ore, averaging $30.46 per ton, with 93% extraction, during the week ended March 8. The tramway from the Monte Cristo mine is nearly completed. The 2400-ft. level of the Ophir yielded 120 tons worth $31.10 per ton, and the cyanide plant treated 629 tons of tailing. Repairs are being made in the Yellow Jacket mill. Pumps at the C. & C. shaft worked without serious interruption.

White Pine County

The Ely National company has cut a vein averaging $8.62 per ton in platinum in its claims near Hamilton.

NEW MEXICO

Grant County

The Chino mine produced 4,014,735 lb. of copper in February, against 1,168,586 lb. for the same month of 1912.

TENNESSEE

Polk County

(Special Correspondence.)—The change in the official roster of the Tennessee Copper Co. took place at the meeting held last week, as was anticipated. The new control of the company is headed by James Phillips, Jr. The Lewisohn interests, represented by Frederick and Walter Lewisohn, and J. Parke Channing, are withdrawn from the company, the other retiring directors being P. S. Henry, H. A. Keliar, Sidney Riddlestosser, E. C. Westlake, and O. B. Van Zant. The board at present consists of Richard Sutro of Sutro Bros. & Co. of the New York Stock Exchange; Joseph Walker, Jr., of Joseph Walker & Sons, also Exchange members; Horace M. Kilborn, vice-president

of the National City Bank of New York; James Phillips, Jr.; Sidney J. Jennings, vice-president of the United States S. R. & M. Co.; Felix Rosen, who is a member of Hayden, Stone & Co.; William B. Thompson, of Thompson, Towle & Co.; A. R. Peacock of Pittsburg, one of 'Carnegie's young men'; Utley Wedge, M. A. H. Westlake, Walter M. Briggs, George W. Breen, Edward T. Cusack, F. A. Sandland, George H. Johnson, Philip Yancey, and William Neeleamer.

The annual report submitted by Frederick Lewisohn, covering operations for the past year, shows a total net profit of $1,095,875; fine copper produced was 13,252,634 lb.; and in addition to this amount of copper taken from the company's mines, there was also produced 4,406,423 lb. of copper from custom ores smelted on toll account. Copper costs were estimated at 11c. per pound. The acid plant yielded 192,084 tons of sulphuric acid, which is the greatest production yet achieved, as this plant has just recently been brought to a point where it can be operated at full capacity. With regard to the policy of the company in making expenditures that have been made during the past few years, the retiring president, Frederick Lewisohn, says in his report that the seven years just passed have constituted a period of continued outlays for construction, involving the development of processes never heretofore employed, and the company has been under constant necessity of devoting large sums to the improvement and extensions of the various plants. From now on the company should be free from the delays and difficulties incident to new construction, which have been encountered in the past, and the stockholders should hereafter receive the benefit of these great expenditures.

Copper Hill, March 1.

TEXAS

El Paso County

It is stated that the American Smelting & Refining Co. will build another smelter at El Paso to handle zinc ore and concentrate from the Southwest and Mexico. The company owns some land near its present plant, and on this the new smelter, to cost $350,000, may be built.

UTAH

Juab County

The Eagle & Blue Bird company will pay a dividend of 5c. per share on April 1. On the 1350-ft. level of the mine, drifts are being driven north in ore. During 1912 the production was 22,341 tons of ore, worth $207,411, of which $91,912 was net earnings.

Salt Lake County

In January the Utah Apex Mining Co. milled 9217 tons of ore and produced 1365 tons of concentrate, all wet weight. Receipts from ore sales were $39,769, and profit from mining operations was $11,147. On the night of March 8 the Utah Copper storeroom caught fire from a hot-blast stove which had been left in the room and closed up. After a while 165 boxes of caps exploded and blew the building to pieces, and R. Hayes, son of the company's treasurer, and C. Abrams, an Italian, were killed by flying débris. The loss is estimated at $200,000.

Since last October the management at the A. S. & R. Co.'s plant at Garfield has been building tanks for the storage of oil, remodeling the reverberatory furnaces, and placing the plant in readiness for the use of oil as fuel. This is now practically completed and four of the six reverberatories have been using oil exclusively. The remaining two reverberatory furnaces are being remodeled. At present the company is using in the neighborhood of 1000 bbl. of oil per day at the plant, and with all the furnaces going it is expected that about 1200 bbl. per day will be consumed. Unlike the method used in the Steptoe Valley plant at McGill, the Garfield plant has raised the arch and widened the furnaces instead of extending them. It is probable that some of the furnaces will, in the future, be extended beyond the 20-ft. length now used at the plant. The management intends to fully try out both methods. New storage tanks have been built, two in number, each having a capacity of 20,000 bbl. of oil. In the slag dump has been sunk two smaller tanks that receive the oil direct from the cars. From this point it is pumped up to the large storage tanks which carry material enough to last 40 days at the present rate. The oil from the smaller tanks in the slag dump is used for immediate needs and the supply in the large tanks is used to provide against any emergency that might arise. The economy of the treatment of ores by oil heat is a question that the company intends to work out. The oil gives a steadier heat and a higher heat than the old method of using coal, but whether the life of the furnace will be as long as when the heat was generated by coal is a question. The work on the tanks and road over the slag bed was to have been finished about Christmas time, but on account of the blasting of slag for this work being extremely hard the work has been delayed. The furnaces are handling an average of about 750 tons of ore per day and the work has thus far given excellent satisfaction. The opening of the Utah oilfields would mean much to the smelting industry of the state. The Garfield plant is the first one to adopt oil-burning reverberatories in Utah. The Utah Copper Co. produced 7,560,521 lb. of copper in January.

Summit County

The report of the Ontario Silver Mining Co. for the year ended December 31, 1912, has been issued. The principal mining operations were carried on by the Mines Operating Co., whose lease expires in February 1921. This lease covers certain parts of the mine above the 900-ft. level. The Ontario company has been opening ore between the 1500 and 1200-ft. levels. The power-plant owned by the company has been sold to the Utah Power & Light Co. for $180,000. Revenue from ore sales and royalties was $23,606, and total receipts were $312,195. Expenditure totaled $20,841, and cash on hand amounts to $228,854.

During the year ended December 31, 1912, the Daly-Judge Mining Co. paid $225,000 in dividends and had $524,478 on hand. Development covered 9784 ft. The Snake Creek drainage tunnel is in 5700 ft. and makes 6300 gal. of water per minute. Most of the work done during the year was on the 500, 600, 700, 900, 1100, 1200, and 1400-ft. levels. At the mill one Wilfley table, one multi-deck Wilfley slimer, two Callow tanks, one Richards-Janney classifier, and one new jig were added to the equipment, resulting in a better separation of lead from zinc. The mill treated 58,951 tons of ore, and 3655 tons was shipped. Concentrate produced was 13,419 tons of lead and 4300 tons of zinc, the ratio of concentration being 3.4 tons to 1. Total ore sales amounted to $728,381. Costs were: marketing, $1.08 per ton; concentrating, 72c.; and operation, $4.70 per ton; and the total was $6.58 per ton.

WASHINGTON

Spokane County

(Special Correspondence.)—A deposit of silica, containing about 5,000,000 tons, has been found 15 miles north of Spokane by G. Latshaw and J. B. Carson. The owners have arranged with a Portland (Oregon) firm to supply 100 tons. Samples have been sent to a glass manufacturer at Pittsburg, and fine glassware was made, the product being considered of high grade. Samples have also been sent to the U. S. Geological Survey for report.

Spokane, February 26.

CANADA

British Columbia.

(Special Correspondence.)—At a special meeting of the Granby Consolidated, the president of the company, W. H. Nichols, stated that the limits of the Hidden Creek ore reserve had not yet been reached. The main adit is 2000 ft. in length on the 530-ft. level, and there are also other adits 100 ft. apart and connected by cross-cuts. The character of the ore is much the same as that at Phoenix, except that it contains about twice as much copper. With reference to the equipment of the property, he stated that the proposed smelter would cost about $1,500,000, and the entire plant $2,500,000. Up to the present time there has been expended about $1,500,000. While stipulating that he did not speak for the entire board of directors, Mr. Nichols said that he thought the shareholders might expect to

receive dividends regularly, while the Hidden Creek property was brought to the point of production.

New York, March 6.

Ontario

(Special Correspondence.)—The new owners of the Dominion Nickel Co.'s holdings in the Sudbury range have started operations. It is now stated that the Guggenheims have obtained an interest and will be associated with the Rothschilds in development of the properties. J. E. McAllister, formerly of the British Columbia Copper Co., will have charge of operations, and it is understood that $5,000,000 has been appropriated to cover the costs of construction and equipment of the mines and smelter. Engineers are laying out the ground, and construction work will be started as soon as possible. The metallurgical process has not yet been definitely decided upon, and no action will be taken until the process in use at the smelters in Norway has been investigated. It is also understood that the company will refine nickel in Canada, and in this case they must look for their market abroad, as there is a duty of 40% on refined nickel entering the United States.

Sudbury, March 3.

The new McIntyre mill at Porcupine is in full operation. It has been decided to increase the Dome mill from 40 to 80 stamps, the present plant having 450 tons capacity. The Beaver Consolidated mill at Cobalt is now treating 100 tons of ore per day, the increase having been obtained by the addition of a ball-mill, two pebble-mills, and six tables. At the 700-ft. level in the mine a cross-cut is being driven toward the vein. During the first quarter of its fiscal year the Coniagas mine produced 900,000 oz. of silver. Ore shipments from 23 Cobalt mines for the first two months of this year totaled 2301 tons, and bullion shipments from 10 mines were 1,154,340 oz., worth $614,448.

Yukon

During the year ended December 31, 1912, the output of the Yukon Gold Co. was worth $4,863,448, working costs were $2,142,029, and operating profits $2,721,419. From these profits were deducted royalties, $692,995; amortization and deferred charges, $577,146; and interest, general expenses, and examinations, $378,686.

Dredge No. 1 of the Yukon Gold Co., on Lower Bonanza creek, was blown up by dynamite February 24, at night. The charge was placed on the deck about midships. The explosion tore a hole about 8 by 20 ft. in the deck, destroyed twelve frames, housing, tables, and save-all, but did comparatively little damage to machinery. The hull filled and sank. On pumping out the pond, only a small hole was found in the bottom of the hull, and few main timbers were injured. Abundant materials are on hand for repairs, which have since been started. It is expected that the dredge will be ready to start operation with the rest of the fleet. No motive for the act is known and the perpetrator has not yet been discovered.

CHILE

During January the Braden mine produced 742 tons of copper, from the treatment of 10,720 tons of ore averaging 2.34% copper, with 66.07% extraction, and the Minerals Separation plant treated 5451 tons of 2.28% ore with 70.20 recovery. This was in the old mill. The new mill treated 39,164 tons of 2.38% ore with 62.87% extraction, and the flotation plant 13,810 tons of 2.22% ore, with 71.5% recovery.

MEXICO

Chihuahua

Electric power from the power-station at the Conchos river is to be transmitted to all the mines in the Parral district as soon as the cables are erected. The Mines Company of America has made a claim against the Mexican government for $36,000 for damages done by rebels to its property.

The troops of this state, who rebelled against the Huerta government, and left Parral last week after mobilizing and recruiting at Santa Barbara, returned on March 5 to retake the city. About 1000 federals from Chihuahua City had reinforced the 200 regulars at Parral. On the afternoon of March 5 a battle started and continued until the evening of March 7. The rebels took the fortified hills surrounding the city, but were dislodged soon after. There were several hundred people killed and wounded, and the city, which is the centre of American mining and industrial

PART OF STATE OF CHIHUAHUA.

interests, was almost destroyed by bombardment and street fighting.

Mexico

During January the Esperanza mill treated 5542 tons of ore and 9044 tons of tailing, and shipped 287 tons of concentrate to the smelter for a total yield of $107,960. Expenses, including $5000 for depreciation of plant, were $81,263, leaving $26,697 profit. Development covered 847 ft. On the San Carlos vein the north drifts have been advanced 210 ft., the average width being 5 ft., assaying $20 per metric ton; also, 125 ft. has been advanced in the raises, ore being 5 ft., worth $40 per ton. Sinking done was 35 ft. in andesite.

San Luis Potosi

On February 11 a band of rebels attacked the property of the Tiro General, which belongs to the American Smelting & Refining Co. They were driven off, but the management abandoned the mine later on, and the rebels returned and looted the place. The damage is estimated at $100,000 and will be heavier if pumps are not kept working. S. F. Shaw is in charge and military protection is being provided.

Sonora

El Tigre mining district was attacked on March 9 by 100 rebels, and the garrison of 160 Federal soldiers surrendered. One hundred Federals escaped with arms and ammunition, but the rebels overtook and disarmed them. The victors of Nacozari and El Tigre are marching upon Agua Prieta and Nogales.

VENEZUELA

The first cargo of iron ore sent to Philadelphia from Imataca, by the Canadian Venezuelan Ore Co., Ltd., of Montreal, averaged 68.20% metallic iron, 0.016% phosphorus, 0.042% sulphur, 1.40% silica, and 0.231% titanic acid. This property is situated about 75 miles from the mouth of the Orinoco river, and over 10,000,000 tons has been opened. Two geologists engaged in exploration of petroleum fields near Lake Maricaibo for the Barber Asphalt Co. have been captured by Indians.

Market Reports

LOCAL METAL PRICES

San Francisco, March 13.

Antimony	12—12½c	Quicksliver (flask)	40
Electrolytic Copper	18—18½c	Tin	52—53½c
Pig Lead	4 60—5.55c	Spelter	8—8½c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES
(By wire from New York.)

NEW YORK, March 13.—Copper is firmer on account of better domestic demands. Lead is easier with larger offerings by producers. Spelter is firmer with more buying. Average daily prices for the past week, in cents per pound, based on wholesale transactions, standard brands, are given below

Date.	Electrolytic Copper.	Lead.	Spelter. St. Louis	Silver, per oz.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

J. A. MURRAY is in San Francisco.

C. M. EYE has returned from Mexico.

SMITH MCKAY is here from Hamburg.

W. H. STORMS has gone to Shasta county.

STEPHEN BIRCH is visiting Peru and Chile.

C. F. SPAULDING is back from Reno, Nevada.

T. M. LEE, of Reno, is at the St. Francis hotel.

R. P. MCLAUGHLIN was in Bakersfield last week.

CLIFFORD DENNIS has returned from eastern Nevada.

R. T. MASON, of Salt Lake City, is in San Francisco.

W. E. PERDEAUX, of Bakersfield, is in San Francisco.

J. V. N. DORR has returned to Denver from New York.

E. F. PELTON is at Columbia University, New York City.

C. S. HALEY is at Panama, but will return to California March 20.

CHARLES JANIN will sail for London from New York March 29.

THOMAS F. PHELAN, of Santa Monica, is visiting San Francisco.

S. J. LEWIS has removed from Guadalajara to Calle Gante 14, Mexico City.

EDGAR RICKARD left San Francisco Friday, returning to London by way of New York.

ALEXANDER ANDERSON has been visiting Western mining districts and was in San Francisco.

EDGAR NEWHOUSE is in Peru and will go from there to Europe by way of Chile and Buenos Ayres.

JOSEPH HENDERSON is foreman and superintendent of the Rhoads-Hall mine on Bedrock creek, Alaska.

J. S. C. WELLS has gone from New York to Santa Domingo. He will return about the first of July.

F. G. FORESHAW left London for Papua, his address being in care of Bank of New South Wales, Port Moresby, Papua.

LLOYD N. KNIFFEN, of White Oaks, New Mexico, is now with the United States Metals Refining Co., Grasselli, Indiana.

ALLAN CUNNINGHAM has resigned as superintendent of the Rhoads-Hall mine to take a position with the Rexall on Wolf creek.

C. R. CORNING and BRADLEY STOUGHTON were among those attending the meeting of the Canadian Mining Institute at Ottawa last week.

A. B. W. HODGES is returning to the United States from Peru. He will probably make headquarters hereafter in one of the Pacific coast states.

GEORGE MATTHEY, who died recently in England at the age of 88, was chairman of Johnson, Matthey & Co., and was best known for his researches on platinum and associated metals.

L. D. RICKETTS, J. PARKE CHANNING, NORMAN CARMICHAEL, J. C. GREENWAY, WILL L. CLARK, A. T. THOMPSON, E. A. COLLINS, and P. G. BECKETT were at Tucson recently to take part in the formation of a Mine Operators' Association, of Arizona.

THE next regular meeting of the 'Old Freibergers in America' will be held on Tuesday, March 25, 1913, at the Hofbrau-Haus, Broadway and 30th street, New York City. This is the 147th anniversary of the founding of the Freiberg *Bergakademie*. At this meeting it is expected that definite plans will be made to hold a meeting in San Francisco and that arrangements will be made to get a large number of the members to plan to go over to Freiberg in 1916 and help celebrate the 150th anniversary of the founding of the old mining school.

Company Reports

WASP NO. 2 MINING COMPANY

The annual report of the Wasp No. 2 Mining Co., covering the year ended December 31, 1912, has just been issued to the stockholders. It shows that the mine was operated steadily except from January 4 to February 13, when extreme winter weather forced a suspension. There was mined 158,840 tons of ore, which yielded $308,175, or an average of $1.94 per ton. Mining cost $90,077, or $0.567 per ton; milling, $99,513, or $0.627 per ton; general expenses were $6377, or $0.04 per ton; a total of $1.234 per ton. Rents and incidental profits bring the gross profits of the year up to $115,519, of which $85,000 was paid in dividends. There were no extraordinary changes or improvements made during the year, the dry-crushing cyanide plant operating satisfactorily, and the open-cut system of mining, utilizing a steam-shovel for stripping, giving about the best possible economical results.

HEDLEY GOLD MINING COMPANY

During the year ended December 31, 1912, development at the Nickel Plate, Silver Plate, and Sunnyside No. 4 mines covered 1340 ft., and 6380 ft. of prospecting by diamond-drill, and ore reserves in the Nickel Plate and Iron Duke claims are estimated at 413,000 tons averaging $11.35 per ton. Mining below No. 4 tunnel-level has been satisfactory, and an incline shaft, known as 'Dickson's incline' has been started, and will be sunk 3000 ft., to be under all the known orebodies, including those in the five claims acquired for $145,913. This should then give payable ore for a length of 1100 ft. The reserve tonnage of broken ore has been maintained at 10,000 tons. The report also gives the following information:

Ore treated, tons	70,445
Gold production	$748,133
Extraction, per cent	95
Total costs, per ton	$5.14
Profit	$385,880
Dividends, No. 10 to 13	360,000
Surplus	226,841

Wages have been increased, and all improvements to plant charged to operating expenses.

GOLDFIELD CONSOLIDATED

During the month of January 1913 the total production of Goldfield Consolidated Mines Co. was 27,169 tons, containing $535,736, or an average of $19.72 per ton, according to the report of J. F. Thorn, general superintendent. Of this, 25,549 tons was milled with an average extraction of 93.76%, and 1620 tons was shipped of an average value of $21.57 per ton, the net recovery from all ore being $18.57 per ton. The net realization was $327,956, or $12.07 per ton. During the month 3296 ft. of development work was performed. The total cost of mining, development, transportation, milling, office, and general expense was $6.64 per ton, distributed as follows:

Mining (including stoping and development)	$3.09
Transportation	0.08
Milling	2.27
Marketing	0.07
General expense	0.30
Bullion tax	0.14
Construction	0.06
Marketing ore	0.70
Total cost of operation	$6.71
Miscellaneous earnings	0.07
Net cost per ton	$6.64

In the Combination, the sill of the 136-BX stope on the second level, about 350 ft. north of the shaft was considerably extended, and produced 1375 tons of ore that averaged $30.56 per ton. The 163-M stope is being cut about 50 ft. north of the 136-BX, and a drift between the two stopes indicates that they are of the same orebody, making a total length of nearly 200 ft., with an average width of 40 ft. Two raises in this orebody have reached a height of 45 ft. Drifts, cross-cuts, and raises are being driven under this on the third level, but up to the present time not enough work has been done to demonstrate its downward extent. In the Mohawk, the 466 cross-cut in the foot-wall of the 490-R stope, between the 450 and 600-ft. levels, and about 250 ft. south of the 354 stope, has been driven 20 ft. through ore that averaged $20 per ton. Two raises and a cross-cut under the big 354 sill are being driven in ore that is averaging about $50 per ton. In the Laguna, rather an important discovery was made in this mine in the 348 intermediate below the 329 stope, between the 450 and 600-ft. levels, 700 ft. south of the shaft. The 303-J raise driven into the hanging wall of the 348, exposed 16 ft. of ore averaging $80 per ton. The 303-K raise driven into the hanging wall from the 329 intermediate 60 ft. higher up, exposed 12 ft. of ore averaging $10 per ton. Other raises are being driven to determine the extent of this orebody.

In the Clermont, the 604-W stope on the downward extension of the 534 orebody, just below the 900-ft. level, 750 ft. south of the shaft, produced 359 tons of ore which averaged $53 per ton. The 802-A sill on the 1300-ft. level was considerably extended, and produced 862 tons of ore that averaged $25 per ton, which was shipped to the smelter. The 420 stope under the 413 sill, about 700 ft. south of the shaft, has been producing a large tonnage of good ore, which has brought the average grade of the Clermont up to about $40 per ton for the month. The formation on the 1400-ft. level is promising, and it is expected that the 1300-ft. orebody will be found at this depth within a short time. The diamond-drill is on the ground, and will be in operation about March 1. A short hole will be drilled in the Reilly vein on the 450-ft. level of the Combination, and after this hole is completed, the machine will be used to prospect the territory below the 1400-ft. level of the Grizzly Bear.

HOMESTAKE MINING COMPANY

This company owns one of the largest gold mines in the world; its mine, 1000 stamps, huge tailing and slime plants, and hydro-electric plant are valued at $21,840,000. The report of the superintendent, T. J. Grier, is extremely short for so important a mine. He states that during the year development covered 914 ft. of raises, 550 ft. of shafts, and 15,264 ft. of drifts, and that there is broken in the stopes 2,030,217 tons of ore. The Ellison shaft is 1850 ft. deep; B. & M., 1550 ft.; Golden Prospect, 1100 ft.; Golden Star, 1400 ft.; Old Brig, 800 ft.; and Golden Gate, 800 ft. deep. The hydro-electric power-plant on Spearfish creek was completed, and power supplied to the works. At January 1, 1913, the balance in banks was $1,614,928; with superintendent, $83,051; and bullion in transit, $273,796. The mills and cyanide plants were described in detail by A. J. Clark and W. J. Sharwood in Bulletin No. 28 of the Institution of Mining and Metallurgy. From the report the following data have been worked out:

Ore treated, tons	1,528,923
Average value, per ton	$4.31
Production	$6,600,953
Receipts from other sources	189,944
Dividends	1,310,400
Costs.	Per ton.
Shafts	$0.01
Mining and 'dead work'	1.52
Milling	0.28
Cyaniding sand	0.12
Regrinding	0.02
Cyaniding slime	0.10
Expenditure in assay office	$ 22,973
Expenditure in foundry and shops	89,986
Purchase of property	151,567
Hydro-electric plant	237,368
General expenses	580,705
Hospital and recreation hall	79,062

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

SILVER-PLATING at the six stamp-mills of the Homestake company cost a total of $26,577 in 1912.

STEAM consumption at the Douglas power plant for the first five months of 1912, on an output of 4700 i.hp., was 13.65 pounds.

WASTE of resinous wood in the lumber industry of the United States amounts to 8,000,000 cords. This can be manufactured into paper products worth about $300,000,000.

MONAZITE is found disseminated through the old placer gravel beds of central Idaho, particularly in the Boise Basin, Long Valley, Rock Flat, Resort, and Warren districts.

PHOSPHATE ROCK is produced from the Waterloo mine, near Montpelier, Bear Lake county, Idaho. The deposit occurs in all respects like pitching coal veins, and are mined with similar tools, at a cost about the same. The rock is clean and requires little sorting, and the average grade shipped is about 70% calcium phosphate, being free from iron and alumina.

SILVER used in manufactures and fine arts in 1910 amounted to 24,789,807 fine ounces, of which 77,344 oz. was from United States coin, 19,691,780 oz. from domestic bullion, 3,417,704 oz. from foreign bullion and coin, and 1,602,979 oz. from old material. The consumption in 1911 was in excess of these figures. Gold used in similar work amounted in value to $41,382,832.

WATER, from mines and other sources, which contain a high percentage of carbonates or chlorides, may be evaporated by the system which uses live steam from boilers and passes through three evaporators. The cooling of steam in raising the temperature of the water produces a vacuum, and consequently less heat is required to reach boiling point. Such a plant is being installed at the Burbanks Main Lode mine, in Western Australia, and is used on steamers and at sugar mills.

THE apex rights of a blanket or flat vein depends upon how clear is the proof of the vein dipping. Apex rights are not allowed on the outcrop of the dip, only on the apex or outcrop of the strike. It is usually hard, in the case of flat veins, to say what is the strike and what is the dip, and in such cases no apex rights are allowed. Speaking generally, there must be a substantial dip before apex rights will be allowed. How much dip is required cannot be said. Deposits which require to be located as placers have no apex rights. Known lodes in placers have dip rights, but other lodes in placers have not.

POHLE AIR-LIFTS may be constructed with the following dimensions to give the capacity stated:

Air pipe, In. diam.	Water pipe, In. diam.	Well pipe, In. diam.	Gallons, per min.
½	1	3	7
¾	1½	4	20
1	2	4½	35
1	2½	5	60
1½	3	6	90
1½	3½	7	120
1½	4	8	160
2	5	9	250
2	6	10	350

GALENA is more resistant to weathering agencies than are the copper sulphides. Where, therefore, galena is found with copper oxides, carbonates, and minor amounts of copper sulphides, in a surface outcropping, there would seem to be more probability of an increase of copper in depth than of lead. So far as surface agencies have entered into the matter they would normally concentrate the lead at or near the surface and carry such copper as was dissolved, into the zone of secondary enrichment. All such deductions must be received with caution, since variation in richness of the primary ore-shoot may more than offset differences due to this secondary action; also secondary galena is known and under favorable circumstances may be abundant.

TUNNEL-SITE LOCATIONS are not strictly mining claims, but such a location gives an inchoate right which may be developed to patent blind and unknown lodes cut by the tunnel. The rights and requirements are succinctly stated in the statutes and regulations. The locator, on commencing work, acquires the right to all veins which may be cut by the tunnel within 3000 ft. of its portal; provided these veins do not exist on the surface, but are blind veins whose existence has theretofore been unknown. The right entitles him to 1500 ft. of the strike of each vein cut, all on one side of the tunnel or divided as he may desire, and from the apex to the lowest depth, just as if located on the surface. He acquires no specific rights by this location over any prior locations, no right to any blind lodes apexing in their ground which he may cut, or right of way through their ground. All locations made subsequent to the commencement of work in the tunnel are made on the peril of losing any blind veins apexing in them, which the tunnel locator may be entitled to through cutting in his tunnel, and which are subject to his right of way.

EXCLUSION OF WATER from oil wells is one of the most important problems connected with economical recovery of oil. In California it has been accomplished in a number of ways, but so far the most uniformly successful method is the cementing process, which is used with slight modifications throughout the 11 principal districts of the state. The operation is in general accomplished in two ways: (1) By pumping the cement mixture through tubing, whence, unable to flow back between the tubing and the casing, it is forced outside the casing; or (2) by lowering the cement mixture in a dump bailer, and forcing it to the outside either by means of a plunger driven down with the aid of water under pressure, or with a plug fitted to the end of the casing. The first mentioned method is commonly known as the pump method, and the devices used for the latter, according to detail, are variously designated by the names of inventors, as the Perkins cement plunger, or the Baker cement plug. The pump method may require from 700 to 50,000 lb. of cement, and the cement is allowed to remain undisturbed for 12 to 14 days, when the tools are run in, and the hole drilled out for about 10 ft. below the casing shoe, and the well let alone for another 24 hours.

COMPRESSED AIR is used for hoisting at the Copper Queen mine, Arizona, and the plant consists of the following: The power plant consists of three air-compressors, two of which are 2-stage, driven by compound steam engines, each delivering 3500 cu. ft. of free air per minute at a rated speed of 75 r.p.m., the third being 2-stage, driven by a triple-expansion four-cylinder steam engine, delivering 7000 cu. ft. at 72 r.p.m., the average pressure being 90 lb. per sq. in. The air-compressor engines are connected to individual ejector condensers. The air is used to operate five first-motion and two geared hoists, several hundred machine-drills and tools, a few air-jet blowers, and some small hoists in the mine. Air for the surface hoists is reheated to 275°F. before use. The old boilers at the various hoists are used as air-receivers to equalize the work of the compressors. In 1911 the average consumption was 6127 cu. ft. of free air per minute, but as the mines are only worked for 16 hr. per day, on six days per week, the consumption during working hours is probably 9000 cu. ft. Two of the first-motion hoists take air for a few seconds at a rate of over 5000 cu. ft. per minute when starting, and require from 1400 to 1600 cu. ft. per shaft per hour. To compress the quantity of air at the power plant takes from 50 to 55 lb. of steam, or approximately 50% of the steam the hoists consume when operated by steam.

EDITORIAL

COMPULSORY industrial accident insurance, covering all employees, is proposed in the bill fathered by the California Industrial Accident Board and now before the Legislature at Sacramento. To reduce the charge, optional state insurance is proposed at cost.

APPOINTMENT of Mr. W. G. McAdoo to be Secretary of the Treasury, while it does not place an engineer in the cabinet, at least gives the President an adviser who is perhaps best known for his share in the accomplishment of a great engineering project. We anticipate that Mr. McAdoo will be known longer as the man who tunneled under the Hudson, than as a lawyer.

MINING does not respect political boundary lines, as is forcibly impressed by reading the list of machinery used in the Scheelite mill described by Mr. V. G. Hills on another page. The fact that Montreal investors in a Nova Scotia mine drew on the experience of a Colorado engineer to plan the work, is a further illustration of the close bonds that tie mining men together.

MECHANICAL charging of blast-furnaces has many advantages and many difficulties. The plan adopted at the Tennessee plant of the Ducktown Sulphur, Copper & Iron Company has been operated so long as to be beyond experiment. Through the courtesy of Mr. W. H. Freeland, the inventor, and Mr. C. W. Renwick, the general manager for the company, we are able this week to give full details.

ATLIN and indeed the whole northwestern coast is excited over reported discovery of placer ground "yielding $6 per pan" at the head of Jennings river in Cassiar mountains east of Lake Teslin. Report of the discovery comes from Skookum Jim, the Indian who was associated with George Carmack in finding the Klondike. A stampede is on, but how important, and with what chance of success, is yet unknown.

UTAH is to be congratulated on having a state mining school that believes research to be no less a part of its work than instruction. No phase of modern university development in the United States is more striking, or, we believe, more significant, than this disposition to make the university in the fullest sense the servant of the state. Discovery of a new method, or adaptation of an old one to meet new difficulties, may well render available ore worth many times the amount of money spent in investigation.

WITHDRAWAL of potash lands from entry does destroy any valid rights previously acquired by location. To set this matter at rest, the order signed by Mr. Taft included the following phrase: "This withdrawal is made subject to all rights lawfully initiated under any valid mining locations made upon such lands so long as such rights are maintained in full compliance with the law.

DROUGHT has been staring in the face the miners of such widely separated states as California and Rhodesia. Up to this week only about half the normal amount of rain had fallen in California, and early in February Rhodesia had received but one-tenth its usual precipitation. The rain that fell Monday last on the Pacific Coast brought comfort to miners and farmers as well. Copious rains are also reported to have fallen recently at Bulawayo and to have relieved anxiety.

NATOMAS CONSOLIDATED has been much in the public eye this week, both because its work in gold dredging and land reclamation has come up for comment in connection with the proposed regulation of dredging, and because of the annual meeting. At the latter Mr. F. W. Griffin, as president, presented a cheerful report on the year's work, of which details are given in our news columns. The stockholders indicated their approval by re-electing the incumbent officers. Mr. Griffin's statement that the company is now fully equipped, emphasizes the point not generally appreciated, that the area of dredging ground is limited, and that even a company with such large holdings as the Natomas cannot go on indefinitely enlarging its plant.

AUSTRALIANS have been celebrating the founding of the new capital of the Commonwealth at Canberra. While there are rumors of discontent at the choice made, and it is, in particular, insisted that the Dalgety district would have afforded a better site, a capital is, after all, the first consideration. State feeling is strong in Australia and the states are much more autonomous than with us. Means to bind the people together, to weld them into one nation, are needed if the Commonwealth is to gain rapidly that place among governments that its area and resources together with the spirit of its people entitle it to aspire. We join in good wishes for Canberra coupled with a modest feeling of pleasure that the plan is that of an American. Our own Washington was laid out by a French engineer, and so we make return to another for what we received from an older people.

ORE DRESSING, lying in the twilight zone between mining and metallurgy as they were long defined, is coming into its own. The field is an inviting one, and the rapidly growing disposition to sieze and apply in it the latest result of abstract science, is a particularly healthy sign of advancement. The study of colloids in relation to ore dressing that we present this week, is an instance in point. Colloids have long been rated puzzling substances through which, while solutions might, as chemists aver, diffuse unimposed, ideas have struggled slowly. We had the pleasure of publishing one of the first important papers on colloids in relation to ores, that of the late H. E. Ashley. Mr. Caetani carries the discussion further and shows just how colloids, sand, and slime complicate the problem of the mill-man. A gradnate of the Univeristy of Rome, of Columbia, and the Bunker Hill mill, Mr. Caetani has an unusual combination of theoretical and practical knowledge. We are glad to announce that he has become one of our special contributors and will write especially about ore-dressing problems. He has an elaborate series of articles in preparation. A number are already completed and others will be available within the year.

MEXICAN conditions change too rapidly for comment by a weekly paper. In the City of Mexico the tone is distinctly hopeful. It is generally agreed that the government is in the hands of strong and competent men. Bankers and mining men are regaining confidence, and the hope is expressed that three months will see an end of disorder. An unexpected and pleasant feature of the situation is the disappearance, at least on the surface, of the anti-American feeling that has been a cause of much anxiety. In the south the situation is unsettled, and it is still to be decided whether Zapata and his followers will continue to fight. If left alone, General Huerta probably would be able, by vigorous measures, to restore order. The surprising feature of the situation is the widespread revolt in the northern states. How substantial the movement may prove when strong columns of regular troops move into the territory, is uncertain, but at present the rebellion shows more signs of popular support than any since the original Madero rising.

PLATINUM discoveries in British Columbia have been repeatedly reported in the last few years, especially by Mr. A. Gordon French, who claimed to have discovered a new method of assay which permitted finding minerals of the platinum group not detected by ordinary analysis. The new localities have been investigated most painstakingly by Mr. W. Fleet Robertson, the capable provincial mineralogist. Mr. Robertson took samples of the reputed platinum-bearing rock and had them assayed both by the ordinary and Mr. French's special method, with negative results that are conclusive. The only firm reporting any platinum in the rock was the S. S. White Dental Company, which is engaged in the manufacture of platinum ware, but of the competence of whose assayer, as Mr. Robertson justly observes, he knows nothing. Remembering the ease with which contamination of ware and fluxes occurs in a commercial laboratory, the evidence of these few assays can hardly lie against negative results from the laboratories of the Bureau of Mines at Ottawa, Johnson, Matthey & Company, the United States Mint, Ledoux & Company, Consolidated Mining & Smelting Company, and the British Columbia government laboratory. In settling this question, though in the negative, Mr. Robertson has performed as valuable a service as though he had discovered a new lode. Government officers must

often puncture rising balloons of hope, but it is theirs to determine always the exact facts and protect the public from exploitation.

LABOR matters at Cobalt have given rise to a good deal of uneasiness among mine managers, and it is feared that there are possibilities of a strike some time in the near future. The miners held a meeting on February 9 to consider the matter, and there were a number of men who were anxious to call a strike at once. The eight-hour law is to come up before the Ontario legislature, and it is believed there is little possibility of it passing. It is thought that this might give the necessary stimulus to the miners to call a strike, and in order as far as possible to offset this action, the mine managers throughout the district met and decided to put the mines on a nine-hour basis. Previous to this, a couple of the mines were working eight hours, others were working nine, while the majority were working ten. Only those mines which were previously working ten hours will be affected by the new regulation. It is not as yet known what influence this may have on conditions, but it is believed that a large majority of the men who have their homes and families in the district are not at all anxious to strike.

Witwatersrand Geology

Johannesburg advices announce the publication of an important monograph on the geology of the Rand, written by Mr. Edward T. Mellor of the Geological Survey of Transvaal. It has long been a matter of comment that no adequate study of the world's greatest goldfield had been made by official geologists. To this it was replied that the importance of the mines had caused the Rand companies to employ the best geologic talent in private studies, and that accordingly much more was known of the Rand than the rest of the Transvaal. The government geologists, therefore, long devoted their major attention to the back districts which, because of failure to promise immediate returns, were not investigated by those privately employed. It came to be realized a couple of years ago that final conclusions could only be drawn from the broadest studies and that for a variety of practical reasons, only a geologist employed by the Government is ever likely to have all of the data before him. As we noted at the time, the Transvaal Survey then entered upon a serious study of the Rand. The volume now published is the first fruit of this investigation and deals with the lower or unproductive division of the Witwatersrand system.

It will be remembered that the gold deposits at Johannesburg occur in certain pre-Cambrian sediments separated by unconformity both from the Swaziland schist and granite below, and the Ventersdorp volcanic lavas, breccias, and conglomerates above. The system itself is divided into an upper and a lower series. The 'reefs' of gold ore that have been mainly worked, occur in the upper division and in the central part of the great area of outcrop. In this part of the field the lower division is poorly developed, but on the Western Rand the beds are well displayed and attain great thickness. The importance of this lower division will be realized when it is recalled that the Brixton section, according to Hatch and Corstorphine, measures 12,650 feet. The difference between the thickness of the beds in the central and western fields, in the absence of unconformity, has been a great puzzle, and the accepted explanation has been an abnormal development to the west. There has always been the hope that in this great thickening of the quartzites, slates, and conglomerates to the west there might be found a corresponding development of gold-bearing 'reefs,' and much money has been spent upon this theory. Patches of ore have been found, but no such continuous bodies as would be called for by the theory of abnormal development. It was to this problem that Mr. Mellor addressed himself, and he finds an explanation in the greater compression to which the beds in the central field have been subjected. He has traced the horizons of one field into the other and made a complete correlation of the beds. That the lower rocks of the Central Rand have been contorted and compressed has long been recognized, but it was not thought that the amount of compression was sufficient to account for the difference in thickness of the rocks in the two areas. Mr. Mellor's explanation will be received with much interest by students of the pre-Cambrian elsewhere, and if the complete evidence, when at hand, sustains his conclusions, as it presumably will, a new and valuable quantitative statement of the effect of one of the earth's great processes will be available. Previous measurements have been of crustal shortening during regional mountain-making. The effect locally of vertical compression has been studied only in a small way.

There is nothing in this first report touching on the geology and structure of the Main Reef series, the principal gold carrier on the Rand, but to this equally detailed attention is being given. That subject is so important and far reaching that it was deemed inadvisable to go into details at this stage of the survey. The Elsberg series is considered by Mr. Mellor to be unconformable to the lower Witwatersrand beds, but not necessarily unconformable to the upper division, the evidence so far obtained pointing to overlap. Nevertheless, there is still much to be learned before the geology of the Elsberg series can be said to be fully known, nor can it with any degree of accuracy be as yet established as a separate geological system. The Elsberg series so far has not proved to be of much economic value, though it contained numerous gold-bearing reefs. The only profitable patch of superposed Elsberg reef is that of the New Reitfontein mine, but whether this is really Elsberg has not yet been established beyond doubt.

Economically this, the first volume on the Rand by the Transvaal Geological Survey, abundantly justifies itself. Indeed, if the study could have been made earlier the useless expenditure of much money would have been saved, and the mines are sure to profit largely from the succeeding volumes of the series now in preparation.

Sand, Slime, and Colloids in Ore Dressing

By Gelasio Caetani

Sand, 'fines,' crystalline matter, slime, and colloid are terms that are used rather indiscriminately to designate various degrees of comminution of an ore; the man in the mill generally applies these terms to various products as they happen to be subdivided in some particular mill. Metallurgists have advanced various definitions, but in this case definitions are based chiefly on some particular feature rather than on the intrinsic physical and chemical characteristics of these materials. It would be well if this matter were some day definitely settled; in this paper the above-mentioned terms will be used with the following meanings.[1]

Definitions

There exists only one well marked division, and that is between crystalline matter and colloid. The crystalline matter includes all particles of minerals, whatever be their size, that show a crystalline or granular structure; it has little or no chemical affinity with water, and its solubility under ordinary ore-dressing conditions is negligible. The colloid will be discussed later. The word 'sand' includes all crystalline matter that is not too coarse to be treated on reciprocating-tables of the Wilfley type. Sand may be subdivided in: 'coarse sand,' 'fine sand,' and 'fines.'

'Coarse sand' may be defined as including all sand that is sufficiently coarse to settle very rapidly and that is not carried in suspension by water running at moderate speed. Any sand coarser than 100 mesh I designate as coarse sand.

'Fine sand' will settle in a short time in still water; in the water running at a moderate speed it is kept in suspension; it will all pass 100-mesh screen, and much of it is found in the undersized of a 250-mesh screen; it can be successfully concentrated on a Wilfley table.

'Fines' includes all crystalline matter so minute that it cannot be included in the fine sand; the diameter of the smaller particles is measured in ten-thousands of an inch. At this extreme state of subdivision the crystalline matter loses many of the attributes of the coarser sand. The viscosity of water and electrostatic repulsion, in great part, or even completely, offset gravity and the particles will remain in suspension for a long time. These very small particles probably have some chemical affinity with water; in size they belong to the same order of dimension as the large polymerized molecules of colloid, and these, in flocculating, will build around some of the crystalline particles. For this reason the complete separation of colloid from the crystalline matter is not possible in practice.

The mixture of colloid and fines is called 'slime', though usually this term is applied to all material that will pass through a 200-mesh screen, regardless of the amount of fine sand it may contain. In some plants it is applied in a still broader sense to all material that is treated in the slime department, even if it contain some comparatively coarse sand.

A colloid is an amorphous substance of gelatinous nature having a well marked chemical affinity. A colloid reacting with ammonia or caustic soda becomes soluble, forming a turbid suspension that will not settle clear. The ammonium or sodium combines with the colloid, forming very large and complex polymerized molecules in which the alkaline radical is an exceedingly small part of the whole. This is the 'sol' form of a colloid. By adding sulphuric acid to a sol, the acid combines with the sodium or ammonium base and the colloid passes into the 'gel' form, which is insoluble and precipitates. By adding barium chloride or lime to a sol, the barium or calcium displaces the sodium or ammonium, forming a new compound which is insoluble and precipitates.

Colloid particles carry also an electrostatic charge which in most cases is negative; under the influence of this charge the particles repeal each other; besides this, with most clays, the negative OH ions have a marked effect in causing the colloid to assume the sol form. An electrostatic charge, therefore, has a marked effect in hindering the settlement of slime. The addition of certain electrolytes, like sulphuric acid, will not only destroy the sol compound, as previously mentioned, but will also decrease the concentration of negative ions. H. E. Ashley, from whom I am quoting freely, has discussed this subject very thoroughly.[2]

Colloids and Electrolytes

The reaction between colloid and electrolytes will vary a great deal from ore to ore; in certain cases the addition of an excess of electrolyte will hinder the settlement of a slime. From all that has been said it becomes evident that the reaction of colloids and electrolytes is quite complicated; in practice the selection of an electrolyte, and the amount required, can best be determined empirically by repeated trials. At times electrolytes such as soap or alum will have a remarkable effect in coagulating and settling slime, even if used in very small quantities. Under the action of an electrolyte the colloid assembles into flocculent masses and the water between the floccules becomes clear. Settling begins immediately and is proportional to the density of the floccules and their size. As the coagulated colloid sinks toward the bottom of a tank it displaces the water, which necessarily has to rise through the interstitial spaces between the floccules. To pass through these tortuous interstitial channels the water must overcome a frictional resistance proportional to the viscosity of the water and inversely proportional to the size of the interstitial channels. At the same time as the floccules settle they come in

[1] Revoking the nomenclature given in *Trans.* Amer. Inst. Min. Eng., Vol. XXXVII, p. 3.

[2] Ashley, H. E., *Mining and Scientific Press*, June 12, 1909. *Trans.* Amer. Inst. Min. Eng., Vol. XLI, p. 380.

contact with each other and become compressed. The measure of the force required to perform this work is given by the difference in specific gravity between the colloid and the water.

Effect of Heat

On heating the water its viscosity rapidly decreases; at 80°C. this viscosity is one-fifth of what it is at zero Centigrade, and on this account heating of the slime water, when this can be done, is most effective in accelerating the settlement of slime. In an instance analyzed by Ashley[3] the rate of settling was a linear function of the temperature; that is, by heating the water from 25 to 65°C. its viscosity is reduced to one-half and the time required to settle a slime to a certain depth is also reduced to one-half.

The addition of an electrolyte will increase both the viscosity and the specific gravity of the liquid; these two features tend to hinder the rate of settling of the colloid, but their effect is more than offset by the beneficial effect due to the coagulation of the colloid.

The size of the interstitial channels between the flocculos is another item that strongly affects the rate of settling. When the flocculos are at a considerable distance apart, either on account of the dilution of the pulp or because the colloid, in coagulating, has segregated in large flocculos, the rate of settling is more rapid; on the other hand, when the flocculos are uniformly and finely disseminated, the water finds difficulty in filtering through, and the settling is retarded. This is well illustrated by taking two glass tubes filled with water containing coagulated colloid and placing one tube vertically and the other at an angle of about 65°. In the vertical tube settling proceeds in the ordinary way; in the inclined tube the flocculos settle vertically until they come in contact with the side of the tube along which they begin to slide, while on the other, or upper, side of the tube there forms a channel of clear water. While the colloid descends along the lower side of the tube, the water rises freely through the open channel, and the settling in the inclined tube proceeds much more rapidly than the settling in the vertical tube. Settling devices based on this principle have been patented, but, strange to say, are not extensively used.

Settling Colloidal Material

Some colloids will settle gradually until they become, in course of time, a compact mass resembling clay; other colloids, instead, will settle within a few hours to a certain degree of consistence, and after that all further settling practically stops. I have had a colloid under observation in bottles for two weeks without being able to detect any further thickening after the colloid had settled to about a fifteenth of the original volume of the pulp. Lime in various proportions was used in these tests as electrolyte; what the effect of other electrolytes would have been I am unable to state. The practical result of this will be discussed later.

The repulsion between the colloid particles due to the electrostatic charge, and the resistance of the flocculos to compression, are two quantities which, to my best knowledge, have not been determined, but are by no means negligible. It is probable also that some water remains imprisoned in the flocculent, cellular mass of colloid and prevents the slime settling beyond a certain limit.

All that has been said is only a summary review of the nature and properties of colloids. The subject is a very wide one and has been the object of a great deal of scientific research work in connection with other industries, and the literature on colloids is extensive.[4]

In current ore-dressing practice it is not possible to make use of all the physical and chemical properties of the colloids; only certain electrolytes can be used, and these must be cheap or must be effective when used in very small quantities. The colloid of one ore will generally differ substantially from the colloid of another ore, and the kind and proportion of the electrolyte required can be best determined empirically by testing the slime with a large number of chemicals. Further than this, it is not necessary nor economically possible in mill work to make a complete separation of crystalline matter and colloid; usually the fine sand passing 200 mesh is separated with the colloid and this slime is treated as one product, no attempt being made to subdivide it further by classification, sorting, or sizing.

Slime

Slime must be considered from two different points of view: as a liquid and as a mill product.

The slime must be considered as a liquid as long as the agitation is sufficient to keep the sand particles in suspension. Under these conditions the slime is a liquid of higher density and viscosity than water, and as such affects the classification and settlement of the coarse sand and the flow of pulp through the launders, over the concentrating tables, and through the grinding machinery. A stamp-battery discharge containing six parts of water to one part of solid and 40% material passing a 200-mesh screen, when kept in agitation, can be considered, for all practical purposes, as a pulp consisting of one part of sand coarser than 200 mesh and of 10.7 parts of liquid consisting of the –200-mesh material kept in suspension in the water. This liquid will have a specific gravity of 1.038; the higher specific gravity of the liquid does not much increase the buoyancy of the sand, but its increased viscosity will cause the sand to settle through the liquid at much lower velocity than would be the case when settling through clear water.

This retarding effect is very noticeable in classification. In most classifiers the sand segregates from the pulp as it reaches the classifier box and sinks toward the bottom, where it is sorted by the rising hydraulic water-columns. The Richards 'hindered-settling classifier' is a typical machine of this kind. While the sand is settling, the pulp progresses through the classifier and the coarse sand therefore follows a more or less parabolic trajec-

[3] *Mining and Scientific Press, loc. cit.*

[4] See bibliography in 'Textbook of Rand Metallurgical Practice,' Vol. I, pp. 205 and 241.

tory. The size of the classifier box must be so calculated that all the coarsest sand will settle over the first sorting column, but at the same time its settling capacity must not be too great, otherwise too much fine sand will settle with the coarse and the first sorting columns become burdened with an excess of fine material. Now if in a classifier of this type, the percentage of slime in the pulp be suddenly increased, the whole regime of the classifier is upset. The increased viscosity of the liquid hinders the free settling and the trajectory of the sand particles becomes elongated, the result being that part of the coarse sand passes beyond the first sorting columns and finds its way into the fine sand spigots. With very colloidal ores I have seen the coarse sand particles go completely astray, travel right over the classifier, and get into the slime overflow. On the contrary, when the amount of slime is much reduced, the sand settles rapidly and the classifier boxes can be made smaller.

Viscosity of Pulp

The Rittinger parabolic formula does not apply to very small particles of sand as the skin friction of the particles and the viscosity of the water in great part counteract the force of gravity. The same is true when applied to coarse sand particles immersed in water containing a large percentage of colloid, and it is for this reason that all the laws of free settling seem to be upset in direct proportion to the amount of slime present in the pulp. With very colloidal pulp, it is practically impossible to keep the slime out of the classifier products except by increasing the hydraulic water and decreasing the output of the spigots. On the contrary, if the slime be separated from the sand before reaching the classifier, the classification is so much improved that even home-made crude appliances give satisfactory work. It is on this account that desliming previous to classification is being more and more adopted. No new plant ought to be erected without this arrangement, and in most of the existing plants serious efforts should be made to install a de-sliming machine of the Dorr, Akins, or 'drag-belt' type.

Choking Launders

Another effect of the presence of slime in a pulp is to increase the carrying capacity of the launders; in other words, the minimum grade required to carry a certain tonnage can be decreased. To understand this it is necessary to analyze the behavior of the sand grains when flowing with clear water through a launder.

When water flows through a launder the frictional resistance against the sides and bottom reduces the velocity of the flow near the contact surfaces; the zone of greatest velocity is found near the centre of the launder and close to the surface; small asperities along the sides deflect the water in small streamers toward the centre of the launder. The result of all this is that the water particles do not travel in a straight line, but rather follow a series of elongated, irregular helicoidal lines that rise from the sides and dip toward the centre of the launder. In addition to this, any obstacle on the bottom of the launder, as the joint between two liners, causes a raising and consequent dropping of the water and generates a well marked wave motion. The small sand grains carried along by a swift-running stream are therefore raised and lowered continuously. On the coarser sand grains the gravity preponderates over the carrying power of the water, and these grains only occasionally are raised from the bottom of the launder; these grains progress by rolling and sliding, and the rolling motion is induced by the friction against the bottom of the launder and the differential speed of the layers of water. The coarse particles of ore progress chiefly by rolling. When a launder is loaded, the grains covering the bottom are so closely packed that the rolling of one particle interferes with that of another; if the load is increased, the sand will build up several grains deep and will interfere still further with the rolling of the bottom layer; these layers of sand form a thick pulp which expends most of its potential energy in overcoming internal friction. At this point the sand particles interlock and the bottom layer stops progressing; a sand bar forms across the launder and conditions grow worse every minute. This is the pathological history of a 'choke-up.'

When the water is clear its viscosity is so small that even small grains travel along the bottom of a launder and coöperate in taking up all the rolling area available. On the contrary, when the water is slimy, its viscosity and specific gravity are increased and the small sand grains cannot settle, but are carried along by the water only 'touching the high spots.' The result is that a launder which will work satisfactorily at a minimum grade with a certain slimy pulp will refuse to work if the slimy water be substituted by clear water, the tonnage and ratio of solid to water remaining the same.

Flow of Mill Pulp

It is erroneous to believe that the flow of a mill pulp is governed by Kutter's formula and that the minimum hydraulic radius will give the best results. Mill launders must be broad, so that the sand grains can spread out and roll without interfering with each other. There is naturally a limit to everything; if the film of pulp in a launder is too thin, the skin friction of the bottom reduces so much the velocity of the water that the efficiency of the launder falls off. Coarse pieces of ore (measuring above 5 mm. in diameter) must always run one grain deep, and if the slope is close to the minimum the water film should be thick enough to cover the ore completely. Where the flow of pulp is liable to vary, a V-shaped launder has the advantage of the channel adjusting itself to the flow of pulp, but it should never be used for coarse material running at a minimum grade because it represents the most unfavorable condition for the free rolling of the particles.

As previously mentioned, when handling very fine sand and slime, the viscosity of the liquid is sufficient to offset the action of gravity on the sand as long as the pulp remains in agitation. In such case a pulp must be considered as a liquid and treated

as a liquid; the launders can be built deep and narrow. If too broad the pulp will deposit banks of sand on the bottom of the launder and only a tortuous channel will remain open through the middle. It is a good practice to use pipes for this kind of pulp; a pipe is cheaper, cleaner, and neater than a launder, and can be run even uphill if there is sufficient hydraulic head available. When this is the case, even coarse sand can be conveyed in this manner. A horizontal pipe has the peculiar equality of adjusting the area of open cross-section in accordance with the flow of pulp; if the pipe is too large it will partly fill with sand; when the flow of pulp increases it will increase the hydrostatic head back of the restricted section and erode the sediment until equilibrium is again established.

Settling Sand

The sand in general will not form accretions permanent in character; where there is a chance for settling, the sand will rapidly lodge itself, and if exposed to vibration and boiling, a concentration of the gold and heavier minerals will take place. This enriched material is, however, easily eroded when the dilution of the mill pulp increases, and this accounts for the increase in the percentage of concentrate that appears on the tables when the feed is cut off from the mill.

The slime in general has a marked tendency to form accretions. Not only will accretions form, and on the side and on the bottom of a launder, but even the water from a settling-tank, after having stood practically motionless in the tank, will on entering a steep launder form slimy or gelatinous deposits that it would be hard to conceive could be deposited from swift-running water. Most of this material is gelatinous, and it is probable that it is derived from the precipitation of colloids that were in the sol form while in the tank. It is also possible that these colloidal 'growths' build up very much in the same manner as crystals are formed.

Turning again to the subject of sand and slime as distinct mill products, it can be said in a general way that in any mill the more completely these materials are separated, the better it is; the treatment of sand in an ore-dressing plant is substantially different from that of slime. It is difficult to effect the separation of sand and slime in one operation; it is easier and more satisfactory to accomplish it by successive stages. In this regard a table of the Wilfley type is a most thorough finishing machine in removing the last traces of colloid from the sand.

Source of Colloids

In most ores the colloid is produced from the decomposition of the feldspar silicates and other minerals in the ore, and is not created to any appreciable extent by the comminution of the ore. Crushing and fine grinding will liberate the included colloid and increase the percentage of colloid to be handled, but the crushing of the undecomposed part of the rock will generate only a small amount of colloid. It is on account of this that the slime obtained from the regrinding of sand, that has already been washed clear of slime, contains generally a low percentage of true colloidal matter and will settle much more rapidly than the slime from the original ore.

In most mills the mistake is made of mixing this crystalline slime with the colloidal slime, whereas by keeping the two seperate the settling capacity of the tanks is increased; to mix the two is, more or less, like sending clear water to the settling-tanks. It is for this reason that in plants where the recovery of water is an important factor, the slimy water from the sand tables and jigs, and the tailing of the slime machinery working on reground material, ought to be kept separate from the original slime. In addition to this, the crystalline slime is physically different from the colloid slime and will concentrate differently and yield a different kind of concentrate.

Settling Slime

Under fixed conditions of dilution, temperature, and percentage of electrolyte, a slime will settle at a certain well defined rate characteristic of its own; this settling rate, that is, the distance settled per minute, will decrease as the slime, in settling, becomes thicker. In a tank operated in a continuous manner, the process of settling will soon acquire a condition of equilibrium which will remain unchanged as long as all other conditions remain stable. When part of the colloid is in the sol form the overflow of the tank will remain turbid, whatever be the rate of feed; if an electrolyte is present, or if all the colloid is in the gel form, the surface of the tank will be clear. In both instances the top of the slime can be seen through the supernatant liquid, and the demarcation between slime and liquid is generally very sharp. When the tank receives neither additional pulp nor discharges through the bottom, the surface of the slime descends at a well defined rate, a specific function of that slime under those conditions. This rate gives the exact amount of clear water (or turbid water if the colloids are in the sol form) that can be drawn off from the tank.

The volume of pulp therefore that can be fed to a tank must be equal to that corresponding to the settling of the slime's surface plus the volume of thickened pulp discharged through the spigot. If the rate of feed is greater than the allowable rate, the surface of the slime will rise until at a certain point the slime overflows; if the rate of feed is less, the surface of the slime will sink deeper until a position of equilibrium is reached.

It is common practice to regulate the flow to a settling-tank in such a manner that the surface of the slime will remain close to the overflow lip of the tank; special care is taken to make the overflow lip as broad as possible and to keep it well leveled so that the flow of the film of water running over shall be the same in every point. If these precautions are not taken, the flow of clear water converging toward the overflow will acquire such velocity in approaching the weir that it will generate ascending currents in the underlying layer of slime and carry some of the colloid into the overflow. So far all this is perfectly correct and justified. Where,

however, many millmen fall into error is by believing that the amount of clear water recovered can be increased by increasing the length of the overflow or by skimming off the clear water as fast as it rises to the top of the slime. As a matter of fact, the amount of clear water produced is not dependent on any such consideration, but corresponds exactly to rate of settling of the slime multiplied by the area of the tank. If a tank is fed beyond capacity, the best decanting arrangements are of no use.

The slime in a deep tank will settle more rapidly than in a shallow tank, but a variation of a few inches in the depth will make little difference in the rate of settling of the slime. It is immaterial, therefore, whether the surface of the slime be kept close to the overflow lip of the settling-tanks or at a few inches below that level. For this reason, when the object of settling is to separate clear water or solution, it is best to keep the level of the slime at some distance from the overflow level; the shape of the tank or the irregularities in the overflow lip are then of secondary importance.

Settling Capacity

From all this it results that the settling capacity of a plant is given by the area and depth of the settling-tanks and not by the overflow or decanting arrangements. In cylindrical tanks discharging through a spigot the slime will build up in the shape of a cone and decrease the volume of the tank available for settling; the Dorr thickener, which is provided with slowly revolving rakes, obviates this by scraping the slime toward the centre as fast as it deposits on the bottom, and for this reason makes it possible to use very broad and comparatively shallow tanks provided with only one central spigot-discharge. In operating these or any other settling-tanks, it must be remembered that a slime is composed always of two distinct materials: (1) a quick-settling material consisting of fine sand, fines, and some colloid; and (2) the true colloid.

As previously mentioned, most colloids after reaching a certain well defined degree of consistence in a comparatively short period of time, will either stop settling any further or will do so only with extreme slowness. It is this particular feature that governs the settling capacity of a tank on any particular slime; if the colloid is not removed from the tank as quickly as it settles to its maximum degree of consistence it will accumulate and eventually overflow. The consistence, therefore, of any slime-discharge is governed by the relative amount of quick-settling material and that of colloid at its maximum degree of consistence; the latter forms the liquid (or moisture) of the spigot-discharge. In other words, a settling-tank acts much as a filter. Both need some granular material to operate successfully; the tank to give a thick discharge, and the filter to form a thick cake.

J. V. N. Dorr has pointed out to me that deep tanks have the advantage of yielding a thicker discharge than shallow tanks. This is accounted for by the fact that the particles of crystalline matter, in settling on top of the spongy mass of packed colloid flocculos, compress these by their weight. It pays, therefore, to use deep tanks when the necessary headroom is available; deep tanks cost comparatively little more than shallow tanks.

Application to Grinding

All that has been said of the slime and sand finds its practical application also in the operation of grinding machinery and of concentrating-tables. The viscosity of the pulp has a great importance in both cases. In the grinding machinery the absence of slime (or the dilution of the pulp) allows the sand to settle rapidly and lie on the die at the moment that the muller or shoe performs its work. If the viscosity of the pulp is raised by the presence of slime, the finer particles of sand have a tendency to remain in suspension and are washed off by the splash caused at the moment that the two crushing surfaces come in contact. This is one of the reasons why dilution of the pulp will increase the capacity of the grinding machinery. An excess in the contrary direction will cause similar effects: in pebble-mills the dilution is often reduced to 50% moisture: in such cases the pulp becomes so thick that not even the very finest material can evade the crushing parts as they come into contact.

Application to Concentrating

On the concentrating-tables the viscosity of the pulp hinders the process of classification and concentration. A Wilfley table will do better work on a fine sand free of colloid than on a slimy pulp. For this same reason a vanner will do better work on a diluted pulp than it will on a thick pulp, and the necessity of feeding a thick pulp to a vanner is solely due to the need of reducing as much as possible the velocity of flow over the belt without decreasing too much the tonnage of solid treated per machine. The presence of slime especially hinders the settling and the concentration of the fine particles, and it is on this account that the recovery of a concentrating-table decreases rapidly as the average fineness of the pulp increases. When hardly any fine sand or 'fines' are present in a pulp, the recovery often becomes so low that it does not pay to attempt to concentrate the pulp; on this account the loss of some colloidal matter in the overflow of the settling-tank is generally of little importance so far as concentration is concerned.

The subject analyzed in the preceding pages is complicated and open to discussion. What I wish to emphasize is that all operations of settling, conveying, and concentrating are affected by the viscosity of the liquid to an extent that is not usually appreciated as much as it should be. The viscosity of water is one of the principal factors in retarding the settling of slime; by heating the water, this viscosity is decreased, and the rate of settling increased: this has been clearly pointed out by Ashley. In a similar manner, the free settling of sand and all granular or crystalline material is hindered by the viscosity of the liquid medium, and this viscosity is not only due to that of the water itself, but also to that caused by the presence of colloidal matter and of fine crystalline particles kept in suspension by the agitation of the liquid.

The Freeland Charging Machine

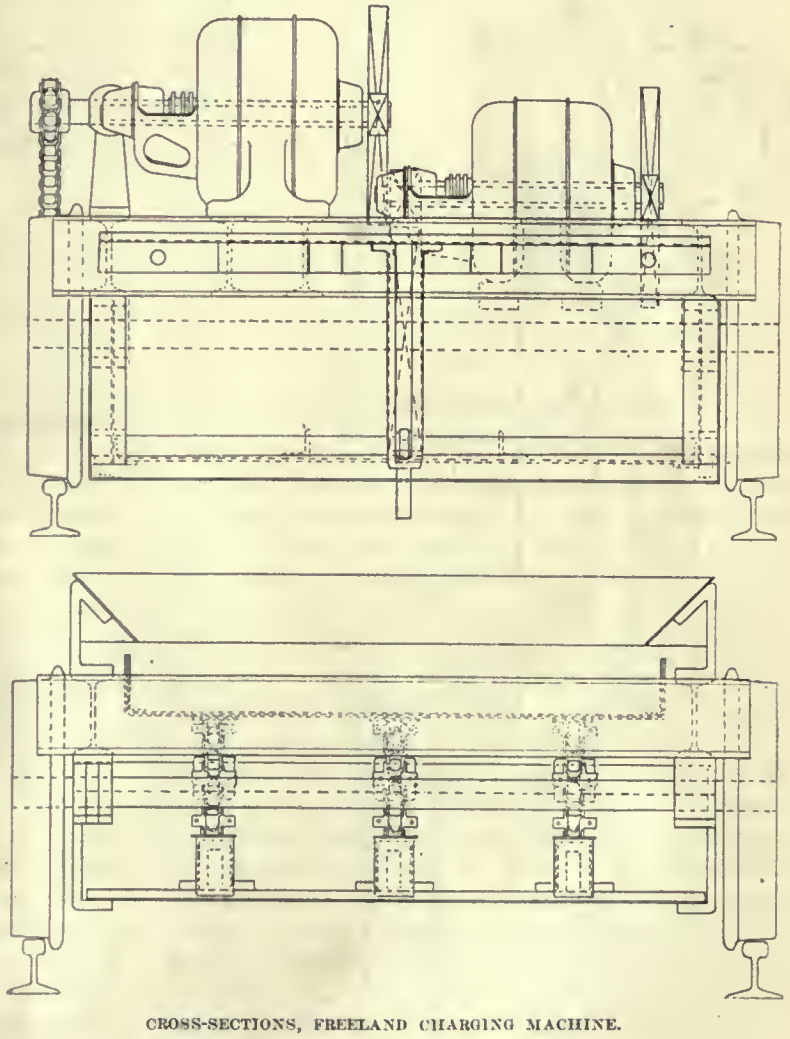
By C. W. Renwick

The original development of the mechanical charging device used at the smelter of the Ducktown Sulphur, Copper & Iron Co., Ltd., at Isabella, Tennessee, dates back to about 1902, when W. H. Freeland, then general manager for the company, began his experiments with pyrite smelting in connection with the Ducktown ores. Previous to this time all the ore was treated by open heap-roasting, the roasted ore then being smelted in small ovel-shaped Herreshoff furnaces of perhaps less than 100 tons daily capacity. Immediately following his well known success in treating these ores by pyritic smelting, the capacity of the furnaces was greatly increased. Naturally the cost and difficulty of hand-feeding was increased in corresponding proportion, and thoughts were immediately turned toward a more practical method of mechanically feeding the furnaces. On account of the varying composition of the ores, as well as the frequent and unavoidable occurrence of 'fines' in the ore, great difficulty was encountered in hand-feeding, to maintain a uniform distribution of the charge. It was impossible to overcome this difficulty so long as the furnace was charged by hand or by means of the usual type of side-dump charging-cars. Accretions and 'scaffolds' persistently formed along the sides and ends of the furnaces, not infrequently bridging from wall to wall, continually threatening the furnace with the danger of 'freezing up.'

To overcome these difficulties, Mr. Freeland conceived the idea of dropping the charge directly and vertically into the furnace with uniform distribution of the charge, not only lengthwise of the furnace, but from side to side as well, the ores and fluxes to be uniformly mixed as they entered the furnace.

This he accomplished by means of a movable framework traversing the furnace lengthwise, this framework carrying an endless-belt conveyor, upon which rested the furnace charge, the motion of the carriage and that of the conveyor being actuated by means of individual motors so arranged as to be capable of operating together or entirely independently of each other. The width of the conveyor was approximately the same as that of the furnace, so that the charge was distributed uniformly from side to side of the furnace. Furthermore, the carriage could be moved or stopped at any point lengthwise of the furnace, thereby allowing any portion or even the whole of the charge to be dropped at any point from end to end. It is to be noted in particular that as the machine traverses the furnace, opportunity is afforded the charger attendant (who rides with the machine) for viewing the interior of the furnace through the opening through which the charge passes, and he can therefore drop the charge directly into such places as where most needed, thereby maintaining an even and level distribution within the furnace. This is essentially the principle of the present charging machine. The idea was ingenious, and the application exceedingly simple. Eight years of successful operation has demonstrated the practical value, and it is unquestionably a fact that much, if not all, of the successful operation of these furnaces is due to the perfect feeding obtained by the use of this machine.

Furthermore, the actual labor involved in charging the furnaces has been very materially reduced, for whereas formerly eight men were required per shift for handling the ore and fluxes and charging same into the furnaces (then smelting about 200 tons per diem), there are required today but two men per shift for the same purpose with furnaces smelting 450 tons per diem.



CROSS-SECTIONS, FREELAND CHARGING MACHINE.

Method of Loading

The method of loading the charging machine is likewise exceedingly simple and provides a conven-

PLAN AND LONGITUDINAL SECTION OF FREELAND CHARGING MACHINE.

ient means for the bedding of the ore and other materials upon the charging machine in any manner desired. The track upon which the machine travels over the furnace is extended back so as to pass directly underneath the ore bunkers, the various compartments of which are provided with chutes and gates of about the same width as the charging machine. It is evident that as the carriage is propelled beneath these chutes, the ore, fluxes, coke, or other materials, can be allowed to drop upon the apron or conveyor, forming beds or layers of any desired depth within the limits of its capacity. When in turn the charge is dropped into the furnace, all the materials are intimately mixed according to the proportions in which they are bedded. Or, if it is desired for any reason to deliver a certain portion of the charge against either side of the furnace, or even entirely in the middle of the furnace, as it is frequently necessary to do in the case of coke added for fuel; this can be accomplished by placing deflecting pieces in the chutes so that the material, as it passes down the chute, is deflected to either side, or by the use of two such deflecting pieces it can be confined entirely to the centre, thus falling upon the charger in the same relative position. In fact, the facilities so readily and easily afforded for loading the charging machine permit of delivering the charges into the furnace in any manner desired, dependent upon the condition of the furnace or the will and judgment of the operator. This is a distinct feature impossible to obtain in any form or type of dump car discharging the ore and fluxes through the sides or top of the furnace.

Used with Open-Top Furnace

The charging machine described and used at the Ducktown plant necessarily operates in connection with an open-top furnace, so that the smoke and gases must be conveyed away to the stack by means of a lateral off-take, the furnace being closed by a movable water-cooled top or cover which is moved out of the way by the carriage as the conveyor dumps its charge into the furnace through the space left open by the dislodgment of the movable top.

By making suitable provision in the design of the charging machine, with accompanying alterations of the furnace top, this principle and method of charging can be applied to almost any rectangular blast-furnace now in use. It can be readily appreciated that in the design of smelter plants yet to be built, suitable provision could be made for the adoption of the charging machine without involving any unreasonable expense, and any expense so involved would be repaid many times over through increased efficiency and decreased cost in the operation of the furnaces.

Summary

Briefly summarizing the above description, there may be noted the following claims of merit for the Freeland charging machine:

1. To secure absolutely uniform distribution and

positive mixing of ores and fluxes entering the furnace, thereby increasing the capacity and efficiency of the furnace.

2. To substitute mechanical for manual labor, whereby a very material saving is made in the cost of feeding the furnace. The motors actuating the charging machine are of the variable-speed reversing type, therefore the speed of either motor and the direction of the carriage's travel is made instantly variable at the will of the operator. Thus the apron conveyor may be discharging its burden into the furnace at any speed, variable at will, while the carriage is being propelled forward and backward or to and fro over the furnace at any desired speed, or the carriage may be stopped at any point in its travel and the apron or conveyor be caused to discharge its burden, or any portion of it, while the carriage is stationary.

3. The position of the operator is such that he can inspect the interior of the furnace at all times, and thus be able to impel or move the carriage in any desirable direction and at any desired rate of speed to distribute the charge to the best advantage and as may be required by the furnace's condition. To this feature of variable distribution great importance is attached, since a furnace's condition is often irregular, owing to scaffolding or incrusting and other causes, which conditions are susceptible of remedy by varying the distribution of the charges as such conditions may call for.

4. The cost of these charging machines, as well as the cost of repairs and power for operating them, is but a small consideration when compared with the savings effected through increased capacity and the more efficient operation of the furnace. Other than the ordinary wear to be expected of the chain and conveyor leaves, there are practically no repairs to keep up.

Metallurgical Research in Utah

An interesting resumé of the research work in metallurgy done by the Utah School of Mines has been issued. The principal funds available come from a fellowship provided by E. A. Wall. The report states that in the laboratories of the school a new process has been worked out for the roasting and leaching of silicious silver ores, using salt. This is the process which has been adopted by the Mines Operating Co. in treating the ores at the old Ontario in Park City, and which, it is stated, has brought the saving up from 68 to 85%, with a material lessening in costs. A process is now being perfected for the treatment of the ores in the Tintic district. In search for a cheap method of preliminary roasting for silver ores to be treated by cyanidation, a pseudo-sinter roasting has been worked out. The product of this process can be leached with a weak cyanide solution, and an extraction obtained of 90% and better. By the use of a blast-roasting furnace, a cheap method of making hydrochloric acid from salt has been discovered, so that the acid may be available at a practical price for use in leaching copper or treating phosphate deposits for the manufacture of fertilizer. An investigation was made of the cause for the low extraction of gold from Mercur base ores. This was determined to be the presence of graphite, which reprecipitates the gold dissolved by the cyanide solution. Experiments resulted in better methods for removing the graphite.

The report goes on to say: "In our investigations on cyaniding silver ores much important data has been obtained concerning reactions of the cyanide solution upon all the common silver minerals and additional agents employed to increase the percentage of extraction of the silver. Also data have been obtained whereby one engaged in the process of designing a concentrating mill can determine definitely the size and inclination of his launders, and the amount of water necessary for transferring a certain tonnage of material of a definite degree of fineness. In connection with these tests there has been developed a unique discharging device for bins feeding launders at a definite tonnage per hour, by means of which a bin of crushed ore may be discharged by the use of an adjustable launder and a jet of water at any speed desired.

"As a further result of an exhaustive series of experiments in our mill a process of water classification has been worked out which may be called reversed hydraulic classification. In this method the slime or finest material is taken out first and then, in their order, the relatively heavier materials. The largest heaviest particles, clean and free from the fine slime, are susceptible to the most delicate gradation by this system. As a result of the close sorting much better separations of the mixed constituents are possible than is the case with any water classifiers ever before used. At the Yellow Pine mill at Good Springs, Nevada—one place where this process is used—oxidized lead-zinc ore, a very undesirable combination—is separated into a lead product and a zinc product, both of which are marketed at a handsome profit. Other separations by use of this method of close sorting of fine materials promise excellent returns.

"Other important research experiments include the testing of portland cement cupels to replace the more expensive bone ash product; the determination of the actual temperatures of the lead button in cupellation; improvements in the methods of assaying cyanide solutions for gold and silver, etc."

White Island, situated in the Bay of Plenty, and about 50 miles from the mainland and 100 miles from the Rotorua district of the North Island of New Zealand, has often been termed the 'safety-valve' of the North Island, as there appears to be a connection with the volcanic district of Rotorua. About the year 1886 the island produced a little sulphur and was then abandoned, and New Zealand depended on imports from Japan for its supply. The White Island Sulphur Co. has recently started work again, and is pumping out the lake, an old crater, preparatory to mining sulphur. Water has been lowered 17 ft., which is 5 ft. above sea-level, and good deposits have been opened. About 4000 tons of high-grade sulphur is on the dump. Retorts for refining are being installed on the island.

Russian Copper in 1912

ST. PETERSBURG CORRESPONDENCE

The copper-smelting industry of Russia continues to make gratifying progress. Progress began in 1907; production in 1906 being 22,680,000 lb., and that of 1907, 31,860,000 lb., after which year the progress was steady and great, reaching 56,304,000 in 1911. Statistics to December 31, 1912, are not yet available, but reports for the first eight months of 1912 show that production of metallic copper in Russia amounted to 48,420,000 lb., and as that total compares with 35,124,000 lb. produced in the first eight months of 1911, which was the record year, obviously 1912 exceeds the preceding year by more than 1911 exceeded 1910. It is anticipated by competent authorities that the total production in Russia of metallic copper for 1912 will be found to have exceeded 72,000,000 lb. In such event the interesting period that has been foreseen for several years will have been attained, when the Russian metallic copper production equals, if not exceeds, its metallic copper consumption: for in 1911 the consumption of copper in Russia was 73,280,000 pounds.

Local Demand

Of course, it must not be assumed, even if the production for 1912 shall have exceeded this level, that it has come abreast of Russia's requirements in copper; for last year metallurgy and industry generally were active in Russia, and the increased use of electricity for light and power, which is becoming general throughout the country, would mean a largely increased consumption of copper as compared with that of 1911. So that, with the increase in the production there has been probably quite as large a ratio of increase in the consumption. Even today, therefore, Russia is not self-supporting from the copper point of view. A recent report, however, is as follows:

"Notwithstanding such a rapid rise in the national production of copper, it is not equal to supplying the current requirements of that metal in Russia; and 9,432,000 lb. of copper was imported from abroad in the first eight months of 1912, as against 11,628,000 lb. imported during the same period of 1911 and 17,172,000 lb. imported during the whole of 1911, and a total of 14,400,000 lb. imported in 1910. However, in view of the important work carried out in the production of copper in various districts of Russia in the form of extension of existing works, and in the erection of new copper plants, the national copper industry may be counted on to completely satisfy the national wants in the years 1913-1914 and perhaps (as has been so frequently foreshadowed in previous reports) become an exporter."

At this interesting juncture when Russia is, so to speak, apparently crossing the line from being an importing country to an exporting country, it will be interesting to refer once more to the parts taken by the various copper-producing districts of the country in relation to the total production. The Urals district stands *facile princeps*, as it has ever since 1906, when the total production was 290,000 poods,* rising to 785,000 p. in 1911. The proportion between the first eight months of 1911 and 1912, respectively, was as between 514,000 p. and 734,000 p. The Caucasus, which produced 237,000 p. in 1906, reached its highest point, namely, 493,000 p., in 1911, and in the first eight months of 1912 it far surpassed the production of the corresponding period of 1911. Siberia, with the Khirghis steppes, has likewise made immense progress, from 135,000 p. in 1906 to 229,000 p. in 1911, and 177,000 p. in the first eight months of 1912 against 142,000 p. in the first eight months of 1911. The production of the chemical works and refineries is relatively trifling; only 55,000 p. in 1911.

Importance of Kyshtim

Since the foregoing report was issued, the quantity of copper smelted in the Urals during the first nine months of 1912 has been reported, and reached the record figure of 793,144 p., or 202,326 p. more than in the corresponding period of 1911. The leading producing company is the Kyshtim Corporation, in its upper Kyshtim plant, where 337,201 p. of copper was smelted. The company next in importance is the Bogosloff, which produced 204,646 p. of copper. Next is the Visk works of the Demidoff Successors with 100,630 p., and finally the Pyshmensky-Klyuchevsky Co., with 79,821 p., and the Polievsky, with 70,836 p. Allowing for the increase in consumption suggested above by reason of the extraordinary activity in the establishment of works requiring copper equipment, such as electric lighting, power stations, and so on, if the rate of increase indicated in the figures given should be continued throughout the present year (and there is every reason to believe the rate will be maintained, if not increased, because some works were out of action last year on account of changes in construction), then Russia will be independent and perhaps a new factor in the copper markets.

Exports

If Russia exports copper it will most probably be from the Caucasus. The Urals and Siberian fields are too far away from the sea to be probable serious competitors for foreign trade: the more so as the various centres where copper consumption is extending are much more convenient to the Siberian and Urals districts than any exterior market would be. On the other hand, industrial development (notwithstanding certain important electrical undertakings in the Caucasus) is not so active far in the south, and should the present rate of increase continue there, the copper producers will be compelled to seek a market outside Russia. Even in respect to the purest electrolytic copper, Russia will hardly be dependent on outside markets. The foreign syndicates that have become important in Russian copper production have added enormously to the electrolytic plants in the country, and the peculiar operation of sending Russian copper out of the country to be refined and returned for consumption in the country will therefore cease to be a feature in Russian business.

*The pood equals 36.11 pounds.

A Tungsten Mine in Nova Scotia

By V. G. Hills

Tungsten in its various minerals, wolframite, hübnerite, and scheelite, is found in all of the provinces of Canada from Cape Breton island to British Columbia; but the only occurrence which has been worked on a commercial scale is the scheelite mine in the central part of Halifax county, Nova Scotia. The mine is 12 miles from the Atlantic coast, 34 miles from the nearest railroad point, and two miles west of the old Moose River gold mines. It is situated in a forest abounding in lakes and swamps. The country is nearly level and some 400 ft. above sea-level.

Geology of Nova Scotia

Nova Scotia has been a gold mining country for a half century, and there is plenty of literature on its geology and its peculiar vein formation. To understand the nature of the veins it may be well to recall briefly that the Nova Scotia peninsula is formed of granite, and Lower Cambrian quartzites and slates; the latter being in a series of folds generally parallel with the Atlantic coast. The quartzites are dark colored and evidently contain much feldspathic material. Layers of the hard pure type are rare. This impure quartzite is called 'whin' by the miners throughout the province; and while it is an inexcusable misnomer (whin being an igneous rock) use of the name is so general that it is unavoidable about the mines, and is often seen in print in articles concerning Nova Scotia mining. The name 'graywacke' fits this rock perfectly, but this term is now to be considered obsolete.

The ore is scheelite and the veins are of the same formation and character as the Nova Scotia gold-bearing veins. They are of quartz and interbedded or interealated with the sediments and generally parallel with them throughout their folds. Their like, I believe, is not known in the metal mining world excepting the famous 'saddle reefs' of Bendigo, Australia, with which they are practically identical in formation. A description of the Bendigo veins has been given by T. A. Rickard.[1] In the Summit mining district, Rio Grande county, Colorado, there are gold-bearing quartz veins which are interbedded between flows of rhyolite and trachyte and folded along with them.[2] However, this is not in a sedimentary formation and the veins have not the compound folding, later described, and the folding is local and not regional as it is in Australia and Nova Scotia.

Saddle Veins

The uniqueness of these 'saddle veins' makes a comparison of the Australian and the Nova Scotian formations most interesting. In both cases the country is composed of quartzites and slates which are crumpled and folded; in both there is developed a series of parallel anticlines; in both the movements causing the folding seem to have a common origin with neighboring intrusive granite; in both the metamorphism of the sedimentary rocks is dynamic; in both the metalliferous deposits are in quartz veins, generally paralleling the original strata and folded along with them; in both regions are found other lodes crossing or connecting the regular interbedded veins; in both the most frequent ore deposit is gold associated with arsenopyrite; and in both cases the ore-shoots usually parallel the folds.

The points of dissimilarity between the two regions are that the anticlines in Nova Scotia are from three to five miles apart, while in Australia they are only from a few hundred feet to one-fourth of a mile, and in Bendigo there is some show of igneous activity, while in Nova Scotia the metamorphism seems entirely dynamic. A prominent feature of the Nova Scotia formation is a peculiar compound folding; the veins themselves being crumpled within the larger folds of the original sedimentary strata. The illustration opposite shows a typical vein on its anticlinal turn.

Origin of Veins

Two entirely different theories have been advanced to explain this most peculiar vein formation. The main point of disagreement is whether these corrugated quartz veins were formed before or after the folding. J. E. Woodman[3] and T. A. Rickard[4] contend that they are the filling of zigzag fissures formed after the folding of the strata was substantially completed. They account for the rounded outlines at the turns as the result of chemical action on the sharp edges. On the other hand, William Dawson, the veteran Nova Scotia geologist, and E. R. Faribault, of the Canadian Geological Survey, take the view that these veins were first formed as pancake-like lenses, during the earlier period of the regional folding, when slight openings between the horizontal beds naturally began to develop as a result of horizontal pressure exerted on the strata, and afterward deformed into the crenulated shapes by differential movement which caused the quartz to crumple in the soft slate beds which were crushed between sliding layers of the harder quartzite. My observation agrees with Dawson and Faribault; but a discussion of this question requires reference to numerous photographs and drawings and cannot be attempted here. The discussion has appeared in the *Proceedings* of the Canadian Mining Institute.

There are later quartz veins which constitute the cross-veins, spurs, and 'angulars.' These were unquestionably formed after the folding. They do not carry ore, but consist of pure white quartz only. The veins bearing the tungsten ore are in the same system and on the same anticline as the old Moose

River gold mines, two miles distant. The scheelite veins had been prospected for gold years before, as shown by trenches overgrown with brush. A little scheelite was found in the old gold mines at Moose River, but no gold, more than a trace, has ever been noted from the tungsten mines.

The vein matter consists substantially of quartz, scheelite, ankerite, and arsenopyrite. There is a little pyrite and calcite, and a few slender black tourmaline crystals which appear in the other four common minerals.

The scheelite seems to be strictly a primary deposit. Not a particle of either of the black tungsten ores has ever been found in these veins. Further, no partly altered specimen has ever been found; where the scheelite occurs touching the ankerite there is a distinct line of demarcation between the two. That the scheelite and the mispickel were the earliest minerals deposited is plain; as they are frequently found brecciated, with the fractures filled with quartz. Occasionally calcite occupies the fractures.

made in the fall of 1907 by a trapper who picked up a piece of the scheelite in the bed of a small brook. He did not know the nature or value of his find. The property was purchased from the locators by a small group of men from Halifax, Montreal, and Ottawa. These good Canadian gentlemen performed the rare mining feat of buying, equipping, and developing a mine with their own money and without the aid of any stock-selling or other form of promotion; and the equipment does not include anything in the line of debts, bonds, or mortgage.

During the short summer seasons in 1909 and 1910 some buildings were erected and a little development work was done. In 1911 an air-compressor was purchased and systematic exploration begun. Also a small but neat and substantial mill was erected.

Considering the actual distances of Scheelite from Halifax, from tidewater, and from a railroad, it is really in a most inaccessible location. To reach Halifax, less than 40 miles distant, it is necessary to travel 34 miles over an indifferent wagon road and

CRENULATED VEIN IN OLD SEDIMENTS. THE SCHEELITE MILL.

The veins are numerous and small, usually from 1 to 6 in. on the flanks, with thicker deposits at both the anticline and the syncline turns. The Scheelite district shows several post-folding faults with throws of 10 to 70 ft. There is no ore in the faults.

On the question of the genesis of ore deposits, which has occupied so much of the discussion of the technical mining world for the past 15 years, and referring particularly to what may be called the controversy between the 'fire men' and the 'water men' as to which was the predominating agency in the deposition of orebodies, I have always regarded J. F. Kemp's 'The Rôle of Igneous Rocks in the Formation of Veins'[5] as being the nearest to a master key to the subject. It is certainly the exception to find an orebody far distant from some form of igneous activity. Consequently, while this district is miles from any surface exposure of granite, I should prefer to think that the granite is at no great depth below this deposit. Most of the tungsten deposits of the world are in granitic rocks or near a granite contact.

Discovery of Tungsten

The discovery of this tungsten occurrence was

[5]*Trans.* Am. Inst. Min. Eng., Vol. XXXI, p. 169.

then 40 miles by rail. Tidewater at Ship Harbor is only 12 miles distant, but there is no connecting wagon-road, not even a bridle path. In this forest-covered country, abounding in lakes and swamps, building roads is expensive and maintaining them more expensive. This condition accounts for the slow progress in the development.

Extent of Plant

In this little mine and mill, situated in Longfellow's "forest primeval," there are Holman drills and rolls from England, a compressor and Wilfley tables from Sherbrooke, Quebec, boilers from Toronto, engines from Moncton, New Brunswick, hammer-drills from Denver, a slime table from Indianapolis, Indiana, a magnetic separator from Milwaukee, Wisconsin, and a roasting furnace built at Truro, Nova Scotia. The hoists, pumps, and other general machinery came from Halifax, Truro, and New Glosco, Nova Scotia; Montreal, Toronto; and Hamilton, Ontario. The lumber was cut in the nearby woods. Sand for concrete and mortar was made by crushing quartzite boulders in an old water-power stamp-mill.

As the ore occurs in numerous thin rich veins the mining requires much cross-cutting, as at Cripple Creek, Colorado; and since the ore is plainly dis-

tinguishable to the eye, it is best stoped by the stripping method.

In milling, the scheelite being more friable than the quartz, the main loss is in the slime tailing, as it is in most cases of wet concentration. I planned a flow-sheet to take advantage of every inexpensive device to prevent sliming. The ore is dumped over a grizzly before going to the crusher; the roll feed is washed by a spray on a coarse screen-conveyor, so that only the clean coarse material goes to the coarse rolls. Rolls are used for crushing as undoubtedly better than stamps, or any other form of screen-faced pulverizing mill, to avoid sliming an ore of such high specific gravity. With this scheelite ore the slime loss is less than with the Colorado black ores.

Milling Methods

In milling this ore, since the scheelite and the mispickel have the same specific gravity (6.0), they, together, form the heads from the concentrating tables. The pyrite is just enough lighter to enable it to be largely thrown with the tailing. The raw concentrate consists of some 45% mispickel, coming partly from the vein and partly from the slate wall-rock. To get rid of the arsenic it is necessary to roast and treat with a magnetic separator. For roasting I built a Wilfley revolving hearth furnace, which roasts a layer one particle in depth with each revolution. It proved satisfactory. For treating separately numerous small lots of both coarse and fine material, and particularly where the furnace cannot be kept in steady operation, I know of no roaster that is more desirable. The literature on the subject of ore roasting seems to be notoriously meagre in reference to the degree of heat to be used and the time of exposure. I found that the mispickel was decidedly better prepared for the magnetic separator by a high temperature and short exposure. Thus. 1500°F. for 50 seconds gave better results, for example than 1100° for 90 seconds.

Character of Concentrate

Some former plans and tests which had been made on roasting this ore had evidently proceeded on the idea of burning off as much of the arsenic as possible; but that idea was all wrong; the best separation of the arsenic can be made by the least possible roasting that will render the iron magnetic; better depend on removing the arsenic with the iron. A Dings single magnet separator was used and made an excellent clean separation. The magnetic product carried an average of 0.72% WO_3, with some lots as low as 0.42%. The non-magnetic product carried only 0.34% arsenic. These returns could, if necessary, be further reduced by using a two-magnet separator or by running through a second time. The separator operated at 8 amperes.

The finished product carried, besides the 0.34% arsenic, a little sulphur and phosphorus. Otherwise the concentrate contained no deleterious elements. While no other tungsten ore in the world compares with the Colorado product for freedom from undesirable elements, this Nova Scotia product is quite within the general market requirements and compares favorably with tungsten concentrate from any part of the world. With my trial run the mill saving was 86.8%. This was afterward increased to 93%. Remembering that, besides the scaly slate gangue augmenting the slime loss, this concentrate has to be subjected to a second loss from flue-dust in roasting, and a third loss from magnetic separation, I regard this as a good saving. The market product carried 70% WO_3. That this is higher than the average of the black ores is of course due to the higher tungstic acid content of the lime tungstate. The coarse table products at Scheelite would run as high as 73% WO_3. The mill was planned to avoid complexity in operation. For this reason jigs were not introduced. They would increase the saving, as would more slime settling capacity; but it is the regular mill problem to determine whether the additional saving would pay for the outlay necessary to produce it.

The Wind-Furnace for Assaying

By George A. James

Physical conditions have such a vital bearing on the errors of the fire assay that they should hold first place in estimating the value of fluxes, and the method used for melting. In comparing the fire assay with the operation of the blast-furnace, these points are seen in exaggerated form. The amount of gold and silver retained in the blast-furnace slag, independent of the lead and matte particles containing these metals, is surprisingly small. Compared to losses in flue-dust and handling the ore, they are of no importance, yet the proportion of lead used to collect the gold and silver is many times less, and the character of the slag much inferior to that of crucible assay for this purpose. Improvement in the efficiency of the blast-furnace has been gained chiefly by recovery of the fine particles ejected from the furnace and the preparation of fine ore so that it is not carried by the blast from the furnace. The same principles should obtain in conducting the fire assay, and, where they are observed, it is surprising what increased accuracy and economy of time result.

Controlling Evolution of Gases

Comparing the contents of a crucible with those of a blast-furnace the gases evolved from fluxes and ore charge can be compared to the air-blast and should be controlled as far as possible if physical losses are not to result while melting. This can be done in two ways, either by preparing a fluxing charge containing the least amount of volatile, or by arranging the greatest possible filtering and vent space during the exit of the gases generated. The amount of gas evolved from an ordinary ½ assay-ton charge of ore and fluxes, in the crucible assay, exceeds 1 cu. ft. (at the temperature used in melting). It can be seen that if care is not taken, there will be mechanical loss by puffing of gas through the flux and ore charge, and by boiling if the gas is evolved after melting has commenced.

This is well understood by assayers, and is guarded against by using slow and cautious initial heating before bringing the fluxed material to the melting point. Even with the greatest precautions, it is

seldom possible to obtain ideal results, and it is usually found that the melt has lifted above the region originally filled by the mixed ore-charge. This is likely to cause loss, and should be avoided. To correct this, besides considering the method of conducting the melt, the character of the flux should be such as to give the least amount of volatile; for example, use Na_2CO_3 instead of $NaHCO_3$, which is commonly employed. Reducing agents containing moisture, hydrocarbons (starch, flour, etc.), or charcoal, which contain a large portion of water and occluded gases, are bad. Sulphur meets this requirement as a reducing agent and has a marked advantage in the case of limestone ores, as will be shown later.

The most important factor, however, is the method used in the melting operation, this in turn depends on the type of melting furnace used. I believe the ordinary gasoline, or gas-wind furnace, in which the crucibles are acted on directly by the flame, to be the best. The muffle furnace, where the melting depends on radiated heat, is the poorest in which to obtain the proper conditions.

Heat Penetration

It requires five minutes for the heat from the flame to penetrate the side of an ordinary clay crucible, and for the action of the heat to spread from this part of the crucible to the contents. It will be seen that if the crucible is introduced into a hot muffle furnace the melting will commence on the exposed top of the contents much in advance of any action in other parts, and a layer of melted material will be formed. The action of the heat will begin later in the rest of the mass, and the gases will then be forced through the melted top layer, which will cause boiling, and carry the ore particles up the side of the crucible, to remain after action has ceased. It might be assumed that this melted portion would act as a desirable filter during the course of the melt, but this advantage is more complete and better where the melting begins at the side.

In the gas-wind furnace the heat strikes one part of the side. The melting begins at this point and advances gradually around the crucible; this opens an adequate vent for the escape of gas in advance of the melting, and instead of boiling it will be found that there is no evidence of the melt rising above the level of the mixed contents, no matter at what speed the melt has taken place. Then, too, this portion of the crucible can be compared to the human nose, containing, as it does, a sticky mass to trap dust particles carried forward by escaping gas. In comparison to the thin layer where the melt commences from the top, its advantage is readily seen. I cannot see the advantage of using indirect heat where the fuel will permit wind-furnaces and direct heat, with their quicker action, greater economy in fuel, and muffles. It takes usually more than enough time to bring a muffle to melting heat for the first charge than to finish the first melt in the wind-furnace. Where muffle-furnaces must be used, the melting faults may be corrected in part, if not entirely. The borax cover operates in this direction. It becomes a spongy mass and a good non-conductor of heat during the first period of the melt and while the gases are to be eliminated, but a crucible cover is much more effective and almost duplicates the condition of the wind-furnace.

In the fluxing of calcium and magnesium carbonates, as before stated, sulphur as a reducing agent is almost essential if boiling is to be prevented. The melting point of the ordinary flux is below the heat required to decompose these carbonates. This results in a suspension of the decomposition until after the other flux is melted, but when the heat reaches a point sufficient to decompose the ore, the carbon CO_2 is evolved almost all at once and carries the melted flux to the top of the crucible. Where sulphur is used as reducing agent, a sulphide of calcium or magnesium is first formed, replacing the carbon CO_2, which escapes at a low temperature, much below the melting point of the flux, and the gases escape gently without lifting the charge.

Reduction of Time

In my office, where jeweler's sweeps and limestone ores that usually cause much trouble from boiling, constitute a large proportion of the work, no evidence is ever seen of a charge rising above the level of the original flux, although no special attention is devoted to the progress of the melting. It is possible to use 15-gram crucibles (even for assay-ton charges) and I have thus reduced the melting time and fuel costs much below what would be necessary were muffle-furnaces used.

Mining in New Zealand in 1912

What is known as the Auckland district of the North Island of New Zealand, in the Hauraki Peninsula, including Coromandel, Thames, and the Ohinemuri districts, which produce practically all of the gold and silver of the North Island, yielded bullion worth $3,744,000 in 1912. This is a decrease of $1,717,920 compared with 1911, caused by the miners' strike, which has been discussed in previous issues of the *Mining and Scientific Press*. The year 1907 was the highest in production, when it was $6,821,760, of which the Waihi and Karangahake districts yielded $5,958,240. The returns for 1912 were as follows:

District.	Tons.	Yield.
Coromandel	910	$ 51,880
Thames	[1]16,000	144,000
Ohinemuri	[2]340,000	3,548,120

[1]Tonnage from two mines estimated.
[2]Includes 94,100 tons of tailing treated.

Individual returns from the principal mines of the Ohinemuri district are as follows:

	Tons.	Yield.
Crown, ore	20,501	$ 196,270
Komata Reefs, ore	5,620	73,770
Talisman, ore	42,780	1,179,500
Waihi, ore	132,610	1,559,560
Waihi Grand Junction, ore	41,712	354,200
Waihi-Paeroa Extraction Co., tailing	94,100	162,280

Pig iron production of the United States in February was 2,582,739 tons, against 2,799,080 tons in January. Calculated on the number of days, the February output was 92,240 tons, and the January 90,293 tons per day.

Underground Timbering and Engine Repairs

By M. W. von Bernewitz.

An interesting bit of repair work was done last year to a Walker air-compressor of 60-drill capacity that has been working at the Associated mine in Kalgoorlie for the past 12 years. The steam and air cylinders of this compressor are 33 and 57 in., and 20 and 45 in., respectively, with a common stroke of 60 in. The maximum speed is 40 r.p.m. On the crank-shaft is a fly-wheel weighing 22 tons. Last spring, from some unexplained reason, a crack developed in the pillow-block on the low-pressure side, extending outward 6 in. from the brass bearing.

The crank passes very close to the block, making the job awkward. The first work was to fit on to the end of the pillow-block a piece of heavy plate. A **U**-bolt of nearly 3 by 1¾-in. size was forged and strapped around the plate and back of the block fairly low down, as may be seen in Fig. 1. When screwed up, this should hold fairly well. The top of the block is held to a certain extent by the cap; but not enough to be sure of. Various suggestions were made as to means for securing this part, but the compressor was in an awkward place and could not be stopped for any length of time. The general manager suggested pressure being brought on the top of the block by a 'tom' or brace on the same principle as holding walls apart, or holding up a roof underground, and this plant was adopted.

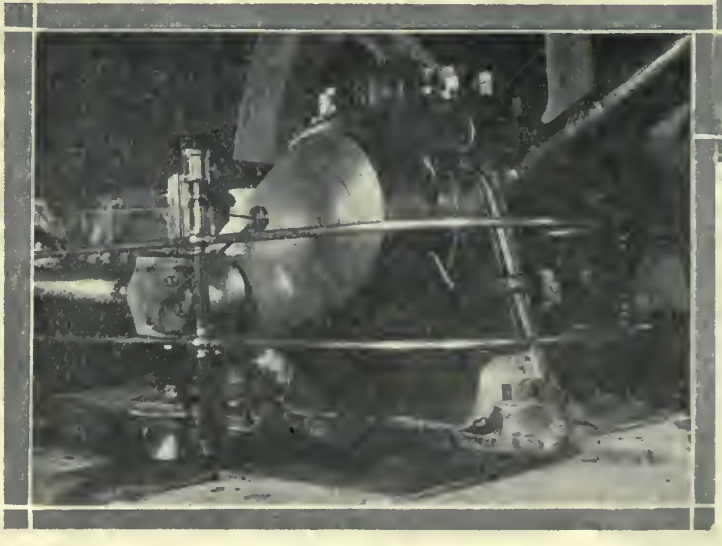

Fig. 1. Pillow-block with bottom of brace on the block. The crack is shown by chalk mark.

It happens that the end of one of the breaker storage bins of 500-ton capacity comes right behind the cracked pillow-block. The total height of this bin with under framing is 50 ft., it is constructed of 12 by 12-in. hewn jarrah, and generally contains 300 tons of ore. At this point there is no movement in the bin. A frame was bolted to the bin under structure, as shown in Fig. 2, and between this and the engine, a brace of salmon gum wood about 16 ft. long and an average of 11 in. diameter was let in, the ends being shaped to the engine block and to a hitch in the timber framework. Under this frame was bolted a piece of 60-lb. rail, and a clamp-bolt was fitted to the top end of brace and through the rail. By screwing this down, great pressure may be brought to bear on the pillow-block and to hold down the portion above the crack. The timber is out of the way, and the job was effective at small cost, without stoppage.

Fig. 2. Top of brace shown in opposite picture, with method of bringing pressure on blocks by clamp-bolt.

Absorption of gold by copper plates has been the cause of a good deal of interesting investigation, but may be prevented to a large extent by having the plates electroplated with silver. This type of plate also catches a larger amount of gold and keeps in better order than the ordinary way of just having one coated with quicksilver. Many large mills are using silver-coated plates, including those at the Homestake and Treadwell mines. On March 10, at the San Francisco plating works owned by E. G. Denniston, four plates of unusual width were coated. These are for the Los Gazabo mine, Round Mountain, Nevada. They are 6 by 7 ft. in size, and are made of No. 11 gauge sheet copper, weighing 5½ lb. per square foot. The plates were hung in the electrolyte solution, and with an electric current of 4 volts and 40 amperes it took 12 hours to deposit 3 oz. of silver per square foot of plate surface. After being drained, the plates showed an even surface, quite free from any globules or holes.

Water pumped from the Waihi mine amounts to 727,000,000 gal. per annum, and is handled by two compound Cornish surface condensing engines and two electrically-driven pumps, the latter lifting the water in two stages from the 1000-ft. level. These are of the 3-throw ram type, with plungers 12 by 30 in., working at 42 r.p.m., and capable of delivering 1500 gal. per minute. The motors are of variable-speed type, working at from 200 to 600 r.p.m., and each is rated at 420 horse-power.

Southern California Iron Ores

Iron ore deposits of the Eagle mountains are situated in the northern part of this range, Riverside county, California. The Arizona & California railroad passes about 35 miles northeast, and both ends of the area are reached by wagon from Mecca on the Southern Pacific railroad. The deposits cover an area of from ¼ to 2 miles wide and 8 miles long. The iron-ore deposits of the district may be grouped into five types, as described by the U. S. Geological Survey: (1) beds and irregular masses of hematite and magnetite, generally inclosed between quartzite beds or between quartzite and quartz monzonite, and generally of large extent, associated with an abundance of gangue minerals, and here and there containing masses of partly replaced or unreplaced crystalline dolomite and quartzite; (2) layers of hematite in crystalline dolomite beds and lenses, lying approximately parallel to the stratification of the dolomite and having great lateral extent compared with their thickness and exhibiting sharp contact with the inclosing dolomite; (3) small replacement deposits in sediments directly at the contact of minor quartz monzonite intrusions; (4) veins in quartzite; (5) veins in quartz monzonite. Analyses of the ores are as follow:

	Per cent.		Per cent.
Fe_2O_3	89.30 to 96.15	MgO	0.20 to 2.16
Al_2O_3	0.16 to 0.66	P_2O_5	0.064 to 0.132
SiO_2	1.80 to 6.70	MnO_2	trace to 0.27
CaO	0.25 to 1.04	S	0.38 to 0.169

These analyses show the percentage of iron to be 62.50 to 67.31%; phosphorus, 0.028 to 0.058%; and manganese, trace to 0.18%. The largest single deposit of ore occurs along the upper ore horizon at the east end group of deposits, and has been exposed, with breaks, for nearly 6000 ft. It has a maximum width of outcrop of about 500 ft. and a thickness of 325 ft., dipping north at an angle of 30 to 35°. The quantity of ore and gangue material is estimated at 40,000,000 tons, of which the latter would be one-third. Estimates of the other large deposits in the district have been made, and the total amount of ore may be set down as 75,000,000 tons, of which one-fifth may be assumed to be gangue material, and the rest ore, most of it high grade. About 100 pits, shafts, and adits have been sunk in development and assessment work, not including the workings of the Iron Chief gold mine.

No iron ore has been mined, and all the principal deposits belong to the Iron Chief Mining Co., only enough work being done to meet the requirements for patent. At present there is no way of utilizing the ore, and it is far from any railroad. Limestone and dolomite for fluxing purposes, though not abundant in southern California, occur at numerous parts of the Mohave and Colorado deserts, and in the San Bernardino mountains. The absence of fuel is the principal obstacle to the establishment of an iron industry in California, the nearest deposits of coking coal being in Colorado, and coal may be brought from Alaska later on, or electric smelting extended, as being done by the Noble Electric Steel Co., near Baird, in Shasta county.

Rapid Analysis for Copper in Furnace Slag

By R. White

*Weigh 1 gm. of slag in a 250-c.c. Jena beaker, moisten with H_2O and add 3 c.c. of H_2SO_4 (1:1). Keep in motion to prevent the slag sticking to the bottom of the beaker. Now add 10 to 15 c.c. of strong HCl and heat over a free flame until the silica is completely gelatinized. Add 1 c.c. of HNO_3, followed by a few drops of hydrofluoric acid, being careful that the hydrofluoric acid does not run down the side of the beaker. Continue heating until almost dry, then put it on a hot plate and fume strongly until all the fluorides are broken up. Cool and add 2 c.c. of dilute H_2SO_4 (1:1) and 3 c.c. of HNO_3; heat until everything is in solution, dilute to about 175 c.c. with cold H_2O, and plate with a rotating anode using 2½ amperes. It should be completely plated in 20 to 35 minutes. If too much HF is used it attacks the beaker strongly, but if care is used a beaker will last for 40 or 50 assays. Also be careful with the fumes, as they are very poisonous. This method has the advantage of being completed in the original beaker.

Mining Costs at the Montana-Tonopah Mine

Details for the year ended August 31, 1912, when 53,874 tons of ore was mined, are as follows:

Labor:		Maintenance and repairs	$0.001
Ore breaking	$0.579		
Mine machines	0.031	Total labor	$2.182
Hoisting and dumping	0.197	Supplies:	
Boilers	0.034	Water	$0.005
Shoveling and sorting	0.675	Ore breaking	0.292
Tramming	0.224	Compressed air	0.111
Timbering	0.209	Hoisting and dumping	0.059
Tool sharpening	0.026	Hoisting (electric power)	0.129
Surveying	0.028	Timbering	0.197
Foreman and bosses	0.078		
Sampling	0.016	Total supplies	$0.793
Storekeeper	0.011		
Assaying	0.016	Total mine cost	$2.975
Watchman	0.011		
Superintendence	0.046		

Potash Lands Withdrawn

The President has recently approved the withdrawal of three tracts of land of the desert-basin type in California and Nevada that are believed, as the result of investigations by the U. S. Geological Survey, to contain valuable deposits of potassium salts and brines. The aggregate area thus withdrawn is 133,829 acres. The first of these withdrawals covered Columbus marsh, Nevada, and was approved on January 16, 1913. The second included the famous Searles lake, California, and was approved on February 21, 1913. The third included lands in the Panamint valley, California, the acreage affected being 24,567 acres.

*Abstract from *Chemist-Analyst*.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Bolivian Mining Regulations

The Editor:

Sir—While going over back numbers of your journal my attention was called to the article 'Mineral Resources of Bolivia,' by Carlos Sanjines, in the issue of March 9, 1912. In this article, when writing on mining regulation in Bolivia, Mr. Sanjines states: "Any person having legal capacity to contract may ask as many as 30 mineral concessions (pertenencias). The measurement for each concession is fixed at 100 square metres (about 327 sq. ft.) in the direction desired by the applicant and extending indefinitely in depth. The procedure is as follows: Any person finding deposits, placers, veins, etc., has to make his application to the Prefect of the Department in which the claim is situated. The Prefect, after having published the application in the papers for some time to see if there is any opposition to the claim, shall issue the decree of concession, and the applicant becomes the owner of the mine, paying the annual tax of $5 Bol. (about $2 U. S. currency) for each pertenencia. An application is considered abandoned if the survey and setting of landmarks are not made within 70 days from the first publication."

In 1912 I went to Bolivia on a prospecting trip, and finding there some likely placer ground, I went through the procedure of taking it up, and my experience in regard to the above statements of Mr. Sanjines is as follows: (1) There is no limit to the number of pertenencias allowed to be taken up in Bolivia by any one individual; (2) the area of a pertenencia is 100 metres square, instead of 100 square metres. In canyons and where intermediate worthless strips are found this may be changed to 50 metres wide by 200 long, so as to keep the continuation required by law; (3) all applications for mining land, no matter where situated in Bolivia, must be made in La Paz, the capital; (4) the annual tax for each pertenencia is 2 bolivianos (80c. U. S. currency). The 70 days during which the surveying and setting of landmarks is required may on application be extended an additional 40 days.

J. J. DALLAND.

Fellows, California, March 12.

Taxation of Mining Claims

The Editor:

Sir—Your publication of criticism of Nevada for taxing patented mining claims opens a subject with many angles.

In 1903 the voters of Nevada balloted on the matter of taxing patented mining claims. In some cases estates and companies of the East had been holding large numbers of good patented claims in various parts of the state and doing no work toward any improvement, paying no taxes, and providing no market for the state's agricultural products, thus forcing all other property to pay high tax rates. As a result of this policy there was no incentive to undertake agricultural development, except in a few highly favored spots. Development even here was going along but half-heartedly, as had been true for many years, because of the generally low prices, the isolation, destruction of the sheep industry, and the effect of drought on the range and cattle. The voters saw fit to tax patented claims as a matter of justice to the few holding and using other property in the state. It was considered necessary in order to keep up the only industrial life that the state had. Also, the majority of the counties were in debt on account of their running expenses, though the latter were low at best. Nye county scrip had sold at 30 cents on the dollar, though receivable as cash for taxes. The Nye county district attorney received a salary of $60 per month in scrip.

With all the mining in the state at present few counties show as yet any improvement as to county revenue, and nowhere has it been proportionate to necessary expenses. It behooves the counties to look into every possible source of revenue. Of all the states in the Union, Nevada has perhaps the best chance to construct and maintain boulevards because of climate and suitable material lying about where wanted. But see what Nevada has! The people are more than willing, but where are the counties to get the money for road-making? If sufficient money were available for systematic instead of spasmodic work, the roads of Nevada would not be shameful. Distances are so great as to discourage individual effort, although something is done. While, therefore, Nevada's new scheme of taxation may seem to work hardship on the few who hold patented claims, or in fact any kind of real estate within the state and have not sufficient funds for such development as appears necessary to make it profitable, should the state take these few from the tax-roll?

However, Nevada does not tax unpatented claims. The bullion tax applies against the profits of all ores extracted within the state, whether from patented or unpatented claims or even from ground not located, and amounts to the local tax rate of each locality. The whole matter of taxing or not taxing patented mining claims seems to be one of balancing the depressing effect of those who can and will try to develop what may or may not be a gutted or otherwise discounted property, against the hardship of those who must pay $10 to $15 per claim annual tax. The latter could have put $100 per claim into property development, presumably to its benefit each year, but they preferred the expense of $225 to $300 for the patenting to do away with the development expense. Proof is afforded in Esmeralda county that many have patented claims to avoid annual expense. In fact, about 30 were not considered by past owners worth paying the tax. As soon as the law is amended to include with real estate all patented claims and to subject them to all the real estate laws, all patented claims whose taxes are allowed to lapse for eight months will be open to sale to any or the highest bidder as county

properties after 30 days' advertising. During six of the eight months the claims will be subject to ordinary tax sale, during which, of course, they can be freely looked over, except in rare cases. Back taxes and charges for 60 years will about equal the total cost of locating and patenting a claim.

GEORGE E. MCCLELLAND.

Blair, Nevada, February 24.

Miner's Liens and Leasing

The Editor:

Sir—In a recent editorial you approve the act of the Arizona legislature which relieves the owner of leased mining ground from financial responsibility for labor performed thereon, provided he has posted notices stating that the ground has been leased and that he will not be liable for wages. After many years of experience in the business, during which I have been lessor, lessee, and employed on leased ground, I cannot agree with you in approving the Arizona law. The growing respect for the rights of the wage-earner and the realization of the fact that he is often not in position to protect himself have brought about great changes in recent legislation. One of the most important and beneficial of these changes is that class of legislation which holds that the property upon which the laborer expends his efforts shall be held for his wages in case his employer fails to pay him. This law sometimes works hardship, but on the whole it undoubtedly makes for justice. The Arizona law is an indirect evasion of the mechanic's lien. Let us consider the conditions: the owner of a mining property does not desire, or is not able, to work the mine himself; he agrees to lease it; his object, of course, is purely selfish; he hopes the lease will open up a big mine, or pay him royalties, or both; he is bound to consider in some measure the character and financial responsibility of the lessee; he is in a position to do this; if he finds from due investigation that the applicant for the lease has no financial standing, he has no moral right, whatever the law, to allow such a party to employ laborers on his ground while he himself evades all responsibility by posting notices; he can protect himself by refusing the lease, or by demanding a bond, or by requiring the lessee to place sufficient funds in a bank to pay running expenses from month to month. Lessees who cannot meet these conditions have no right to be in the business. On the other hand, the laborer cannot investigate the financial standing of the lessee; he needs a job or he would not be looking for one; and he takes all the chances he ought to be required to take when he trusts the lessee backed by the value of the property leased; even then he is likely enough to get the worst of it.

The Arizona law, it seems to me, is a direct invitation to the owner of mining property to evade his moral responsibility; under authority of that law he could, and beyond all question he often would, lease his property instead of working, and for the very purpose of avoiding financial responsibility. Instead of taking the legitimate chances of mining, he would turn his property over to a lessee of no financial standing; if the property turned out well, the owner would gain; if not, the poor devils who did the work would lose; another instance of that antithesis of all legitimate mining, 'heads I win, tails you lose.'

F. N. FLETCHER.

Reno, Nevada, March 11.

[There is justice in our correspondent's contentions, and we heartily favor the growing disposition to protect more carefully the laboring man's rights. His first claim upon the product of his labor we believe sound, and should lie against shipments of ore, concentrate in bins, the winter dumps of the Far North, and similar products. That it should go beyond and rest against the mine itself is less certain. Leasing is a good system. It has rescued and rejuvenated many an old mine. It has given many a man his chance. Its virtue lies in the opportunity it affords for men with little or no capital to get a start, and its benefits flow from substitution of intelligent self-interest for the too often perfunctory performance of labor under a hired superintendent. If a mine-owner must back the lessees to the full extent of the value of the property, there is no sufficient inducement to grant leases. It is true he is in better position to investigate the standing of a proposed lessee than is the laboring man out of a job. In fact, he does make such investigation before he grants the lease. If, however, he must then stay on the job, day after day, and see that the lessee does not become insolvent, he loses one of the chief advantages of leasing, namely, the ability to arrange for the working of a small property during the absence of the owner. The laboring man being on the ground, watching the conduct of the business, should be able to protect his own interest by being given the right to levy on the proceeds of the mine. If, however, the men and local supply houses have always the final security of the mine itself, they become careless, take longer chances, and invite disaster. The posted notice, combined with the granting of the lease, says in effect to all concerned: "I the owner have investigated the resources and character of the one to whom I have granted this lease, and find both sufficiently satisfactory to warrant my turning over to him this property for temporary use. I refuse to be bound by his debts, but you, being on the ground and knowing the situation, are expected to keep watch and protect your interests from now on." This, as it seems to us, divides responsibility not inequitably, and opens the way to leasing mines. There will be some injustice under any system, and it is well to narrow the chances of fraud and failure as much as possible, but it is also important to leave the way open for working mines and developing new ones.—EDITOR.]

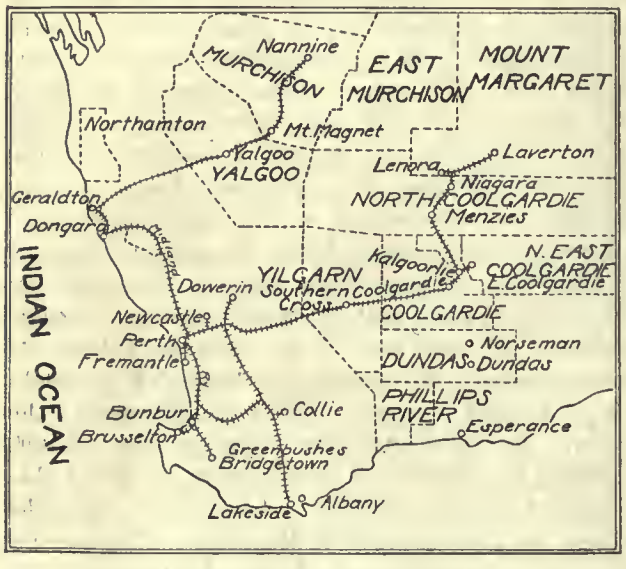
North and South America are the largest markets for our iron and steel manufactures exported. In a few articles, such as metal-working machinery, mining machinery, sewing machines, cash registers, builders' hardware, and steel billets, Europe is a large purchaser, but in nearly all of the other classes the Americas are the largest purchasers.

Special Correspondence

WESTERN AUSTRALIA

IVANHOE.—GOLDEN HORSE-SHOE.—YILGARN.—SOUTHERN CROSS. —VICTORIOUS AT ORO BANDA.—KYARRA.

After months of deliberation the various labor unions have finally decided to take a ballot as to whether they shall go on strike, or before the Arbitration Court. The majority of the men like the majority of the unions are so financially hard up that the result of the ballot is certain to be in favor of arbitration. The long uncertainty has done an immense amount of damage to the goldfields. The final decision will be made on January 26. The outlook of the big mines at Kalgoorlie is far from reassuring, one after another has suddenly reduced its output without warning. The latest is the Ivanhoe, which maintained an average grade since April last of $9.48 per ton, and an average monthly profit of $80,000. During December the grade fell to $8.91 and the profit declined to $52,800. The decline is ascribed by the management to Christmas holidays, but is really due to the fact that, in the three deepest levels, the lode is unprofitable south of the shaft.



WESTERN AUSTRALIAN MINING DISTRICTS.

The Ivanhoe has long been regarded as the most consistent mine in the district, and its impoverishment at depth is very disquieting. Up to date the mine has produced 2,607,750 tons with a yield of $35,839,970, and dividends aggregating $15,093,750 have been distributed. The reserve fund of the company amounts to $500,000. The original cash working capital of the company was only $200,000, and practically the whole of the present equipment and development of the mine have been paid for out of proceeds of gold won.

The Golden Horse-Shoe, which has been under a cloud for the past two years, has a chance of improving its position in the near future. Early in 1911 the directors arranged with the board of the Great Boulder company to bore from the 2500, 2650, and 2800-ft. levels of the latter mine to test the Horse-Shoe No. 4 lode at these levels. These bore-holes disclosed ore of high value at all these levels, the lode being found from 10 to 20 ft. inside the Horse-Shoe boundary. Cross-cuts were then driven and fully confirmed the bore-hole results. These cross-cuts were continued 200 ft. farther west to meet the Horse-Shoe shaft when sunk. The shaft is now completed to the 2480-ft. level (Boulder 2500 ft.), and is being pushed on to 2630 ft. (Boulder 2650 ft.), while a winze is already down 2630 ft. and is being continued to 2780 ft. (Boulder 2800 ft.). The cross-cut from the Boulder proved the lode at 2480 ft. to be 30 in. wide and to contain tellurides and free gold. A drift was started south and the first 10 ft. driven on ore assaying $119 per ton over a width of 36 in. The next 5 ft. improved to $319 per ton, at which point driving was stopped until work could be resumed from the Horse-Shoe's own shaft, which is now completed to that point. The Horse-Shoe has produced 3,087,300 tons, with a return of $42,557,000 and paid dividends amounting to $15,375,000. It has a nominal capital of $75,000,000, and outstanding debentures of $500,000 bearing interest at 6%. The capital was originally only $400,000 and was 'watered' to its present amount. The lease originally belonged to the Golden Link company and was passed on to the Golden Horse-Shoe company for $7500 in cash and $317,500 in fully paid shares of the latter company.

After long negotiations the Government has agreed to subsidize the Yilgarn Diamond Drilling Co., chiefly represented by Claude de Dernales, to test Frasers mine at Southern Cross by diamond-drilling. The terms are that the Government provide $10 for every $5 provided by the company, up to a maximum of $33,300, and also grant the use of a boring plant. A. Montgomery, government mining engineer, who is supervising the work, has selected two sites for the first two bores, and work has already commenced. The first hole is expected to pierce the lode at a depth of 700 ft., and the second at 500. The scheme was very strongly recommended four years ago by Harry P. Woodward, government geologist, subsequently supported by Mr. Montgomery. There are three gold-bearing lodes on the property, but only one has been worked. The mine was started as long ago as May 1889, before the cyanide process had been developed. The equipment was quite antiquated, and the 30-stamp mill had stamps of 650 lb. only and was hand fed. The ore-shoot has been stoped out for a length of nearly 4000 ft., and no work has been done below 300 ft. The mine has produced $3,622,500 from 325,600 tons, and in any other country would long ago have been further tested after such a splendid record.

Burbanks Birthday, six miles south of Coolgardie, has been let to tributers since August 1907. Prior to that date the mine produced $3,031,500 from 156,300 tons and paid $497,500 in dividends. From August 1907 to the end of December 1912 tributers mined and treated 26,750 tons for $369,000, but no less than 11,500 tons of this total, yielding $139,000, have been won since May 1912. The past two months, alone, yielded $38,600 from 3040 tons. After March the mine will be worked by the company on wages, but it will probably not pay. The company is in debt to the extent of $107,100, and the lode was found to be cut off by an intrusion of granite at No. 9 level as long ago as August 1905. All the gold won since then has come from the upper levels.

The Edna May, near the Southern Cross, found as a result of the Bullfinch boom, looks as if it might make a big record. The original prospectors mined and treated 581 tons with a returns of $20,000, and then sold the property for $400,000 cash to a Melbourne company with a nominal capital of $125,000 in shares of $2.50. This was in October, and already the company has treated 726 tons by amalgamation only, with a return of $30,000, with $8.75 per ton in its residue. The whole of the ore came from developing the lode at 70 ft., where a drift has been extended for a distance of 220 ft. The lode is 10 ft. wide, with bulges in places up to 17 ft. There is still nearly 1000 ft. to be driven to the east boundary of the lease, and rich ore is showing in the face of the drift in that direction. The lode in this property is in kaolin, but at each end the country changes to schist, and the lode breaks up into short lenses or shoots, becoming very erratic.

The Victorious, at Ora Banda, acquired by the Associated Northern a year ago at a cost of $110,000, looks as if it were to prove a good speculation. When bought, the ore was considered to be worth about $5.50 per ton, but recently the lode at the 370-ft. level has shown a marked improvement. It has been driven on for nearly 200 ft. and has ranged from $5.75 up to $60 per ton over a width of 60 in. The last 50 ft. driven averaged $60 per ton, and the face is in ore of this class. When the company acquired this property the shares were quoted nominally at $1.25. They have recently advanced to $3.50. During

December 7000 tons was treated with a return of $34,500 and a profit of $11,500, but during January it is expected that some 9000 tons will be milled for an enhanced profit. The property is in a district about 40 miles northwest of Kalgoorlie, and pronounced by geologists to be a continuation of the Kalgoorlie belt of country.

The Kyarra at Meekathara is turning out far better than expected. Before the mine was taken by an Adelaide company in April last, the owners had treated 758 tons for $39,500, broken from the 30-ft. level, water level. Since then the mine has been opened up to 200 ft., where the lode is 10 ft. wide, assaying $90 per ton at the bottom of the shaft. The north drift at this level is in 14 ft., in ore assaying $70, and the south drift 14 ft. in ore assaying $50. The mill started crushing in the middle of December and treated 304 tons for $7100, with an average in the residue of $10.50 per ton. This is a wonderful return.

PORCUPINE

HOLLINGER HAS GOOD YEAR.—DOME USING ELECTRICITY.—SMALL MINES ACTIVE.—SWASTIKA AND UNGAVA ATTRACTING ATTENTION.

The last report of the Hollinger mines shows conditions to be exceedingly satisfactory. For the last six months of 1912, the net operating profit was $600,664, notwithstanding the heavy additional expenses and losses incurred during the strike in November and December. For the two weeks ended February 4 and February 11 there was milled 2025 and 2122 tons containing $65,005 and $59,313, respectively. At that time there were 35 stamps in commission, but now all 40 are running and it is stated that the mill will have no difficulty in producing about $75,000 per week, as the additional stamp capacity will permit of treating a larger tonnage than formerly. When development was first started on the 300-ft. level, the grade of the ore was disappointing, but it was later found that the company had been working on a branch vein. A considerable amount of development has now been done on the main vein at this level, and the results to date show that the ore is of as high grade as on the upper levels, while the width is as great, if not greater. Despite the satisfactory statements of earnings, there is considerable criticism with reference to the length of time it is taking to attain any great depth. The company has now been operating for over three years, but the 300-ft. level has only been opened very recently and a small amount of driving accomplished. Notwithstanding the satisfactory grade of the ore and the number of veins, it is essential that a property of this sort, milling about 400 tons per day, should be proved at depth as rapidly as possible, and the slowness in this regard is one of the disappointing features. There have, of course, been many circumstances serving to retard the development of the mine, but it is believed that this is one of the points that should have had first consideration.

The Dome mine is now running on electric power at a considerable saving over former conditions. Steam-generated power in Porcupine costs in the neighborhood of $150 per horse-power year, while electric power costs about $50. On a property using about 1000 hp., as is the case with the Dome, this is a very important item. The development work at the No. 2 shaft has been satisfactory and a large body of ore, the presence of which was heretofore unsuspected, is now being developed. The question of increasing the capacity of the mill is under consideration, although nothing definite has as yet been decided upon. If the development of the mine during the next six months continues to be as satisfactory, there is every reason to expect that steps will be taken to double the capacity of the mill. While the metallurgical practice at this mine has in most respects been extremely satisfactory, it is thought that by making some changes, the cost of treatment may be cut down. Experiments are being conducted toward this end.

Among the smaller mines, there is pronounced activity, and indications point toward a good deal of construction during the coming season. The Jupiter mine is being unwatered and the company will start sinking the main shaft to the 500-ft. level. A new crusher and the other necessary machinery to permit of this work has already been ordered. It is expected that work on the mill will be started within a month. At the McEnaney, a 5-stamp mill is now in operation and satisfactory results are being obtained. Development on the 400-ft. level of this property has been so encouraging that the management has decided to increase the capacity of the mill. It is probable that 15 more stamps will be added, making 20 in all. Arrangements have now been completed for the financing of the bonds of the Vipond mine and the construction of the cyanide plant will start about the end of March. Although it has not as yet been absolutely decided, it is probable that the decantation process will be used. This is an entirely new departure for the Porcupine district. Good progress is being made with the construction of the Dome Lake mill, which should be in commission in about a month's time. As a result of the reduction of the capitalization from $2,500,000 to $5,000,000, the stock is now being sent in for transfer on the basis of 20 old shares for 3 of the new. There are 1,000,000 shares in the treasury and the balance is held by the General Assets Limited and a few industrials.

The Minister of Labor at Ottawa has instructed the sheriff at North Bay to release on ticket of leave, the three Porcupine miners who were convicted of offences under the Industrial Deputies Act and sentenced to terms of imprisonment at Sudbury in default of the payment of fines. The cases arose out of the strike of miners in the Porcupine district when the Hollinger company took action against the men for striking without notice as required by law. The cases are being appealed, and pending the results of the action, the men have been released. The Swastika district is still attracting considerable attention, and a good many sales of properties have recently been made. These sales are, however, in the majority of cases, to men who have no intention of operating the properties, but are simply holding them for a rise in price due to the speculative element attracted by the rich shipments from the Tough property. This company has shipped several cars of ore running between $400 and $600 per ton. The vein is, however, very narrow and it is doubtful if the property will ever make a large mine. There are other interesting prospects in the district, but the prices at which they are held do not permit of their development. So far, nothing has been discovered which will compare with the Tough claims. Alex Gillies, one of the stakers of the Hollinger mine, is getting up a party to go into Ungava in the spring. The party will consist of about eight men who expect to be gone four or five months. They have no particular objective, but are on a general prospecting trip and believe that the geological conditions warrant the expectation of discovering something of value. A start will be made as soon as the ice leaves the rivers.

SALT LAKE CITY, UTAH

COST OF LEAD.—TRANSPORTATION TO ALTA.—BINGHAM MINES REPORT.—ONTARIO CHANGES.

What does it cost the leading mines to produce a pound of lead? This question, asked some of the leading producers in connection with the prospective tariff revision, has shown a woeful lack of statistical records in connection with the lead industry, especially in the Rocky Mountain region. The fact is proving a great handicap in the fight to prevent a radical cut in the lead tariff. Some of the largest mining companies of America can give only a vague idea of what the cost of production is, or cannot tell at all. This stands in marked contrast to the custom of copper-mining companies in treating 'cost per pound' as one of the principal features of their accounting. As a result, the organization of lead producers which is preparing to combat before Congress any reduction in the lead tariff, is having difficulty. This is more especially true of the mines carrying silver and gold in association with the lead. A general call has been issued to mine-owners to furnish statistics for the aid of the committee,

of which Duncan MacVichie of Salt Lake City is chairman, but so far the call has brought almost no results.

Alta is soon to have better transportation facilities, if the plan of J. G. Jacobs is carried through. Mr. Jacobs, who built the Salt Lake & Mercur road a number of years ago, has secured from the Denver & Rio Grande a lease on the branch road from Midvale to Sand Spur, and the right-of-way extending beyond that to Wasatch, a summer resort in Little Cottonwood canyon. Another mile takes the road to some granite quarries, and two miles from Tanner's Flat, the terminus of the Michigan-Utah overhead tram. It is the intention to extend the tramway to the terminus of the road. The distance from Midvale to Wasatch is 10.1 miles. The completion of these plans will eliminate entirely the wagon haul between Alta and the smelters, cutting down the cost of hauling both ore and supplies.

The Bingham Mines Co., which has been working along quietly for some time, has issued an annual report which shows net earnings of $138,113, compared with $109,248 for 1911. This is in the face of a shut-down of the Dalton & Lark and Commercial mines in Bingham for several months on account of the strike. From this must be deducted $28,920 interest on first-mortgage bonds. During the year $81,000 par value of these bonds was purchased and canceled. Eagle & Blue Bell, of Tintic, which is controlled by the Bingham Mines Co., earned $91,912 for the year, the best it has ever done. The president, Mr. Graves, says that during 1913, there will be available for further reduction of bonded indebtedness $145,067. On account of the favorable contracts for smelting it now has, and of the hostility of farmers against smelter smoke, the company's smelter, originally built by Bingham Consolidated, has been sold and will be dismantled. The original cost was in the neighborhood of $1,000,000.

The annual report of the Ontario Silver Mining Co., of Park City, discloses the fact that property of the Park City Light, Heat & Power Co., all of the stock of which was owned by the Ontario, has been sold to the Utah Power & Light Co. for $180,000. The company now has $228,854 cash on hand and $62,500 in New York City and American Smelters Securities Co. bonds.

RHODESIA

GLOBE & PHOENIX.—EMPRESS PALMEIRA.—CAM & MOTOR.—OUTPUT OF SOUTHERN RHODESIA FOR 1912.

At last the directors of the Globe & Phoenix gold mine munificently have decided to accept lesser fees and to allow shareholders to have some representation on the board. This latter concession seems altogether ludicrous, but it is quite true that with a fine show of liberality the eight well paid gentlemen who constitute the London board of directors have agreed to allow a nominee of the shareholders in their midst. Unfortunately, the Globe & Phoenix is far from being the exception, as among Rhodesian mining concerns it is rather the rule among Charterland mining enterprises that those who have sunk capital in mining concerns are regarded as unimportant factors. As to the latest position at the Globe & Phoenix, the new roasting plant is operating successfully. Developments underground, on the whole, appear to remain fairly satisfactory, but there seems to be some reason for qualifying this statement somewhat in its application to the lowest levels. A third interim dividend of 1s. 9d. per 5s. share has just been declared.

At the Empress-Palmeira mine, owned by the South African Prospecting & Concessions Syndicate, the bulk of the machinery recently ordered to effect a duplication of the existing compressor and power haulage plant has arrived. The balance, light parts, and fittings, is due to arrive shortly. All possible sources of delay through flooded rivers have, so far as can be seen, now been avoided and the erection of the plant will proceed with all possible speed. The concrete foundations for the two new boilers, compressor, driving engine, and hoist were prepared in advance, and the last named is already in position for use. According to latest reports from the mine, all working faces in the east and west lodes are looking well.

The Cam & Motor company is preparing to commence productive operations at an early date and tenders are invited for the supply and delivery of wood fuel in the proximity of the main shaft. An enormous quantity has been called for, and it would seem that the company does not for the time intend to avail itself of any coal from Wankie.

While an increase of approximately £60,000 over the 1911 total is shown in the gold output of Southern Rhodesia for 1912, the dividend list was considerably less. The gold output of Matabelland and Mashonaland for last year was valued at £2,707,369, as compared with £2,647,896, and that of 'other minerals' at £257,230, as against £242,863 in the preceding year. The total value of the mineral output thus was £2,964,599, as compared with £2,890,759. So far as can be gathered at present, the gold mining, financial, and colliery companies paid out in respect of last year's operations £566,971, which is a long way below the 1911 distribution of £954,613. The amounts paid out last year are as follows:

	Per cent.	Value.
Bechuanaland Exploration Co.	4	£8,000
Charter Trust	7½	35,312
Charterland & General	5	8,190
Eldorado Banket	30	90,000
Gaika	5	13,675
Giant	32½	84,942
Globe & Phoenix	110	220,000
Lonely Reef	20	54,200
Mayo	10	15,201
Rezende	7½	8,881
Rhodesian Gold Ex.	15	805
Susanna mines	7½	2,437
Wankie colliery	12½	25,327

The decrease is due in a large measure to the absence from the list of the old Rhodesian Exploration & Development Co. (now absorbed by the Consolidated Gold Fields), which distributed £151,000 in 1911; Willoughby Consolidated, which returned £31,700; and the Enterprise G. M. & E. Co., which paid out £20,000. There also are reductions to be recorded in the declarations of the Charter Trust and of the Giant, while the Globe & Phoenix distribution is 10% less. The total sum paid out has not come up to expectation, but having regard to the absence of the Rhodesia Exploration & Development Co. through absorption by the Gold Fields, the total cannot on the whole be regarded as unsatisfactory.

NEW YORK

GERMAN FINANCIAL SITUATION BAD.—COPPER PRICES STEADY.—TUOLUMNE REPORT.—BUTTE CENTRAL LOOKING UP.—CANADIAN STATISTICS.—NIPISSING AND HEDLEY DO WELL.

General conditions in Wall Street have not changed, at least there has been no marked indication of a more hopeful tone. Some months ago and at a time when Germany was attracting more than her usual share of attention as a large user of copper, mention was made in these columns of the over extended position financially at Berlin, and the suggestion was made that when some degree of final liquidation was demanded, the German Empire would be found to be in need of real and substantial aid, if all of her many recently erected chimneys were to be kept smoking. The forecast so made has been more than justified, and while anything like talk of panic or any widespread financial disaster has been deprecated, the gold shipments sent from New York to Berlin, or to other points for Berlin account, have been matters of grave concern during the past fortnight. Nearly everyone is professing to believe that beyond the footing of the tremendous bills which have already been incurred, the European situation holds nothing of ominous portent for the future: nevertheless, the weight of the armaments is so tremendous, the appropriations for munitions, supplies, and even millions for aerial military machines—the exactions upon young men, who need to be engaged for their own good and that of their country in various lines of fruitful industry, are so large—that there is much more back of the

financial situation than appears at first glance. Beyond three or four days of semi-panicky conditions in which new low records for the year were made for several issues, market movements have been negligible and public interest as completely lacking as it has been during the past three or four months or longer.

In copper metal markets, the situation in Europe has been the governing factor. It is undoubtedly true that for the most part, in spite of all the various forms of agitation, Europe is still going forward industrially, but it is equally true that in reality the war of dollars and cents now being waged in the piling up of indebtedness must, in all prudence, be counted almost as much fraught with danger as the actual clash of arms. At home and abroad, there are a good many overwrought nerves. Copper metal has been steady at 15½c., with domestic consumers apparently willing to come in the market at 15c. Exports for January and February of this year are more than 33,000,000 lb. under the exports for the corresponding period last year. Whether or not this decrease will be overcome later will depend fully as much upon financial conditions as upon the eventual peaceful settlement in southeastern Europe. The annual report of the Tuolumne Copper Co. shows a production during 1912 of 4,716,047 lb. of copper, 131,867 oz. silver, and 259 oz. gold. The average copper content of the ore mined was 7.5%. The deepest working of the Tuolumne is now 2300 ft. The Tuolumne interests control the Pilot Butte Mining Co., and the latter is just developing into a shipping property which is expected to be a regular producer by the middle of June. The issues of both companies are held very largely in the East. Butte is to have another important producer soon in the Butte Central, which for the present is largely a silver producer. The ore is to be treated by cyanidation, and it is anticipated that the property will develop as have so many of the older properties in Butte with gold and silver in the upper levels, and copper at depth. The concentrator is now handling 125 tons per day, and from the present outlook this capacity can be at least trebled in the near future. Several examinations have been made of the property, and Butte will not be at all surprised if some of the important mining interests absorb the Butte Central. Apparently the final chapter has been written in the history of the Rudefeha-Ferris-Haggerty-Battle Lake-Tunnel Site-Doane-Rambler-North American-Penn-Wyoming Copper Co. A final decree of foreclosure has been entered in favor of the Continental & Commercial Trust & Savings bank. The history of the various promotions organized with the old Rudefeha property as a basis, if ever told in full, will read like one of George Randolph Chester's 'Wallingford' stories. None of the properties in the district has ever been able to produce enough copper to get on a regular paying basis, but various groups of promoters in succession have managed to sell to the public, millions and millions of shares in various organizations and reorganizations. Stock was sold when the mergers were put together and money was raised when they were taken apart, and again when reassembled.

The preliminary annual report covering the mineral production for the Dominion of Canada for 1912 has just been given out by the Director of Mines. The production of the more important metals as given is as follows: Copper, 77,775,600 lb., being an increase of 22,127,589 lb. as compared with 1911. The gold output was 607,609 oz., being an increase over the preceding 12 months of 134,450 oz. It is a little surprising to note that in spite of the recent revival in Cobalt, and the equipment which has been put in and which is handling low-grade ores so successfully, there was a decrease in silver production. The silver output amounted to 31,931,710 oz., being a decrease of 627,334 oz. Of the entire mineral output, the province of Ontario is credited with 38% and British Columbia with 22%. Speaking generally, the report says that "a feature of particular interest during the year was the continued and extended development of ore reserves. The satisfactory results from these operations, particularly in the case of copper-nickel ores of the Sudbury district, the Porcupine gold ores of Ontario, and a number of copper and lead deposits of British Columbia point to much greater annual output in the future." The City of Cobalt property has been sold by the City of Cobalt Mining Co. to Ottawa people for $750,000. The Nipissing Mines Co. of Cobalt has declared its quarterly dividend of 5%, with the usual extra disbursement of 2½%, payable April 21. The financial statement of the Nipissing company at the end of the quarter shows total cash assets of $1,202,257. The Nipissing company is not alone in its building up of a strong treasury position. The La Rose Consolidated Mines Co. reports on March 1 a cash balance on hand of $1,425,836: ore shipments in transit, $184,032; ore ready for shipment, $78,017; total, $1,687,885. It is understood that the balances being built up in the treasury of these two companies will possibly be reinvested in the first big enterprise to be undertaken by the Canadian development company which was organized a year or more ago by Messrs. Ambrose Monell, Percy Rockefeller, William E. Cory, E. C. Converse, and associates. The Hedley Gold Mining Co. has declared a quarterly dividend of 5%, being the regular distribution of 3%, with an extra payment of 2% payable March 31. The Hedley company has done particularly well in its dividend record; on the first of the year it distributed the regular 3% dividend with a Christmas donation for the shareholders of 12% extra; the shares are listed on the Boston Stock Exchange, but are so closely held that trades are rarely recorded. The Pato dredge belonging to the Oroville Dredging, Ltd., sank in February, but was promptly repaired and refloated. Only minor damage and small loss of time is reported.

AUSTIN, TEXAS

PROPOSED NEW MINING ACT.—A DEEP WELL.

Another effort is being made to secure the unreserved opening for the public lands of Texas to prospecting. The present law does not, it is thought, sufficiently do this, and C. B. Hudspeth and R. E. Burger of El Paso have respectively introduced in the Senate and House a new act. The proposed law provides for location of both placer and lode claims and gives exclusive possession, following discovery, staking, and survey, during such period as $100 worth of work shall be done annually on each claim. A royalty of 5% of the gross output is to be paid, and the number of claims that any individual, firm, or corporation may locate or lease is limited to five. A. M. Sivenson & Sons are drilling a deep test-well near Spur, in the 'panhandle.' It is now over 4000 ft. deep and will be continued until an adequate water-supply is found or drilling becomes too difficult.

DENVER, COLORADO

CONEJOS COUNTY REPORTS GOLD DISCOVERY.

Conejos county has recently been brought to the notice of mining men through a reported gold discovery, made by a new prospector in the district named Gilmore. The property lies three miles west of Platoro, and in a territory heretofore considered outside of this mineral belt. This new find is tellurium and free gold, in a 2-ft. streak of a well defined quartz, following a porphyry dike. It is reported to average about $700 per ton. The property is being worked by a force of men this winter, and ore is being sacked for shipment in the spring. Owing to Gilmore having Cripple Creek friends, large operators there have sent representatives to get hold of the property. While these men were on the ground in October, a heavy snow-storm came and covered the ground so that actual prospecting of the veins covered by the locations could not be undertaken. The Cripple Creek men are planning to return early in the spring.

The older properties in the district have produced large quantities of high-grade ore in the past. One has shipped $300,000 worth. The veins are large well defined 'fissures' carrying widths of 3 to 15 ft., and averaging $7 to $15 in gold and silver per ton. There is a good power site on the Conejos river a few miles below Platoro, which can be developed at small expense.

General Mining News

ALASKA

JUNEAU

The Alaska Gastineau Mining Co. will install a 200-hp. motor and three 100-kva. and three 150-kva. transformers, which have been ordered from the General Electric Company.

ARIZONA

GILA COUNTY

The old Champion mine was opened in 1875, and from that year to 1884 produced about $200,000 in silver and was then shut down. During the past week it was explored as far as possible, and old dumps have been looked over. It is now the intention to reopen the mine.

(Special Correspondence.)—At the United Verde Extension mine at Globe the work of clearing up the workings on the 800-ft. level still continues. Active development has been delayed pending the arrival of the air-compressor. There has also been some intended delay incident to acquiring the Jerome-Verde Copper Co. and also the Florence claim of which W. A. Clark owns one-third interest. These interests have now been secured. While the old company was working the property it was reported that more than the one ore lode had been discovered in the ground.

Globe, March 12.

During 1912 the Southwestern Miami Development Co. did 11,300 ft. of churn-drilling on claims adjoining the Live Oak. Five of the seven holes drilled show an extension of the Live Oak orebody, and, based on drill records, there is apparently 1,500,000 tons of ore in the claims. At Miami the slicing system of mining is gradually being superseded by the shrinkage-stope method. The new change-house at No. 4 shaft, to accommodate 860 men, is nearing completion. It is of steel and concrete and contains 100 shower baths, and steel lockers. During February, development at the Inspiration covered 5220 feet.

MOHAVE COUNTY

The Boundary Cone shaft is down 550 ft., and a drift is being driven east toward the ore-shoot found in the winze below the 450-ft. level, and is now in good ore. It is stated that rich ore has been opened on the 500-ft. level of the Gold Road mine.

PIMA COUNTY

(Special Correspondence.)—The Pioneer Smelting Co. is now handling about 180 tons of ore per day, of which 40 tons is derived from the Plumed Knight mine. The company's smelter at Corwin, originally built as an oil-fired blast-furnace, has been reconstructed so as to use coke in the ordinary way. The oil smelted the charge successfully, but it was found impossible to secure an even distribution of heat in the smelting column, so that the use of oil has been abandoned for the present, though it is planned to make further experiments later. As a result of the activities of the smelting company, which handles a good deal of custom ore, a number of promising prospects are developing throughout the country.

Tucson, March 10.

YAVAPAI COUNTY

(Special Correspondence.)—The Midnight Test mine on Groom creek is to be operated again at an early date. This property has good ore in its workings. The main shaft is down 450 ft. A revival of mining operations on Groom creek will be generally welcomed. The district is an old one, and in the past produced a great deal of rich ore, but these old properties have been lying idle for years. Many poor men made stakes on Groom creek: A rich find is reported from the Redman mine, near McCabe.

Prescott, March 10.

The Best Friend group of claims, in the Weaver district, 9 miles southwest of Kirkland, are opening satisfactorily. Three shafts are down 70, 100, and 150 ft., and ore containing copper and gold has been opened. The adit of the Nelson mine at Crown King is in 900 ft., and for a considerable distance 3 to 5 ft. of ore has been driven on, assaying from $20 to $100 per ton. Another adit is to be driven below this one. The Climax 10-stamp mill has started work. The adit in the Christmas claim, adjoining the Climax group at Hassayampa, is in 125 ft., and shows 18 in. of ore.

CALIFORNIA

CALAVERAS COUNTY

(Special Correspondence.)—The Utica Mining Co. has resumed operations at its Gold Cliff and Cross mines after a shut-down of about five months because of lack of water-power. The 40-stamp mill at the Gold Cliff is running on fair-grade ore from this property, and the Stickles plant is operating on quartz from the 1800-ft. workings of the Cross. Repairs are still under way on the flumes, ditches, and reservoirs of the company. Work has been resumed at the Reiner gravel property, on Bald hill, a mile from here. A new head-frame has been erected, and new machinery installed to replace the equipment destroyed by fire last fall. It is understood that Eastern capitalists have become heavily interested and that the mill will probably be rebuilt before the end of next summer. A. C. Wilson, formerly assistant superintendent of the Utica company, has been placed in charge of affairs. John C. Benson is president. The diamond-drill at the Waterman mine has intersected a promising ore-shoot. Samples of the quartz are currently reported to assay well in gold, and the management plans to sink a working shaft at an early date. The North Star mill is running on ore from the 600-ft. workings.

Angels Camp, March 16.

SACRAMENTO COUNTY

The report of the Natomas Consolidated of California for the year ended December 31, 1912, contains the following information: Results of the year's operations were

NATOMAS No. 8, DURING CONSTRUCTION.

highly satisfactory. No. 7 dredge went out of commission in May; No. 8, which was destroyed by fire, in October 1911, was being rebuilt during the whole year; and No. 10, which was not finished until October, only worked 3 months. The 'fleet' is practically complete, save No. 7, which is being reconstructed with a steel hull. During

the current year record returns are expected from this department. The rock-crushing department had a quiet run owing to inactivity in permanent road construction. In November a contract was closed with the State Highway Commission to supply 500,000 tons of rock. A washing plant was erected at No. 2 crusher plant, which will add to its general efficiency. The engineering department has charge of all mechanical and field construction; and in reclamation district No. 1000 three miles of levee was completed, and two miles is under construction. At the river levee a right-of-way was cleared for 18 miles, and 13 miles of core-trench and auxiliary levees were completed by drag-line excavators. In district No. 1001 the Yankee slough levees were finished, also those along the Bear, Feather, and Sacramento rivers. Land to be cleared, before the material was placed, to form these 33 miles of levees, was 750 acres. Ten thousand acres of land are ready for subdivision. In the irrigated land section, the Alder creek electric pumping plant, of 50,000 gal. per minute capacity, was completed. Other finished work in the distributing system covered approximately 21 miles of concrete-lined ditch, steel flume, siphons, main canal, and main and secondary laterals. The town of Citrus has been laid out and lands subdivided. The land department was formed in February 1912, and 3600 acres were cleared and 6300 acres prepared for grain and alfalfa planting. The production of table and wine grapes was 18,000 crates and 84,000 lb., respectively; also 9000 lb. of olives and 15,000 lb. of oranges. The whole of the company's agricultural property has been put on a producing basis, and the reclamation of land should be complete in 1913. The operations of the company during the past year may be summarized as follows:

Gravel dredged, cu. yd.	22,155,162
East side levee, material moved, cu. yd.	470,000
River levee, material excavated, cu. yd.	788,000
River levee, placed by suction dredge, cu. yd.	275,000
Material placed for Yankee slough levees, cu. yd.	3,500,000
Yield from dredges	$2,020,635
Revenue from rock-crushing, orchards, and other departments	323,406
Net income, after deducting all expenses, including loss on No. 8 dredge	1,013,683
Assets:	
Gold-dredging properties	$13,431,337
Reclamation properties	16,600,859
Irrigated land properties	4,044,426
Water department properties	4,551,042
Rock-crushing properties	1,047,772
Engineering department	1,154,542
Construction department, dredges	761,873
General equipment	90,872
Total capital assets	$41,682,724

Current assets total $735,679, and include cash, $132,176, and material and supplies, $455,502. The surplus at January 1, 1913, was $1,300,520. The capital stock of this company is 250,000 shares of $100 each, of which 160,688 have been issued, while bond issues total $17,467,000.

Shasta County

(Special Correspondence.)—Porter & Taylor have arranged to place a small electrically-operated steam-shovel on the Russell placers, near Igo. Prospecting with shafts is going forward rapidly, and gravel of good grade has been proved. The Noble Electric Steel Co. has completed most of the work at its new smelter, and expects to blow in two furnaces early in April. Each furnace has a rated capacity of 200 tons per day and will require 2000 hp. The Hazel Gold Mining Co. is disbursing regular monthly dividends of $9000, at the rate of 1c. per share. To date, the company has paid out $891,000 to stockholders. The company operates the Gladstone mine at French Gulch.

Redding, March 11.

Sierra County

A company is being formed to control the gravel properties of this county, covering about 7000 acres of patented land. The business is being negotiated by F. M. Phelps and is said to be the biggest deal in mining property in northern California for several years.

Tuolumne County

(Special Correspondence.)—Electricity is now the only power used at the Dutch mine, at Quartz, the last change from steam to electric power having just been made by the installation of a new hoist. A telephone system has also been put into the mine. The Rising sun mine, at Arastraville, owned by San Jose people, is being unwatered for further development. James Bennett and J. J. Beatty, of Carson City, Nevada, have secured a bond on the Hibbing ranch, at Blanket creek, and will shortly begin the development of some promising prospects on the property.

The Jamestown Exploration Co. was incorporated this week. Its capitalization is $100,000, with shares at $1 each, and Jamestown is the principal place of business. The directors are John Lane, J. P. Mangante, A. P. Azeredo, Ed. Parr, and A. Campora, all of Jamestown.

Gravel that yields as much as $30 per carload has been uncovered in a claim on the Stanislaus river, northwest of Tuttletown, by John Witney. The indications are that the gravel deposit is of great magnitude. Suit has been brought against the Central Mother Lode Mining Co. for $50,000 damages by Richard N. Magee for injuries received on January 14, 1913, while employed in the Mangante mine, near Jamestown. The names of James Watkins and F. E. Vickery, of Oakland, and F. M. Scammell, of Piedmont, appear as directors in the articles of incorporation of the Columbia Mining Co., filed in this county last week. The capital stock of the company is $300,000, with shares at $1 each.

Sonora, March 8.

(Special Correspondence.)—The Tonopah Belmont Development Co., which has been developing the Dreisam mine at Tuolumne, has stopped work, the property not having justified the payment which fell due on March 5. W. B. Chidester has been in charge and has returned to Tonopah.

Tuolumne, March 18.

COLORADO

Clear Creek County

(Special Correspondence.)—Work was resumed this week on the Oriental property situated on Lincoln mountain. August Swanson & Co., the owners, contemplate purchasing electrically-driven machinery this spring. Ore shipments have been started by S. Selander & Co., leasing at the Anamosa mine on Columbia mountain. The product is consigned to the Combination mill at Idaho Springs. The Pelican mill at Silver Plume is to be overhauled and repaired. H. B. Clifford & Co., of New York, will operate the plant under lease. Four sets of lessees are at work at the Conquerer mine on Covode mountain, and an average of 25 tons of ore is being mined daily. J. L. Wegrich is manager. Heavy shipments of concentrate are being made from the Pioneer mill, returning $25 per ton. Work has been resumed at the Little Giant mine on Red Elephant mountain. The 270-ft. shaft is to be sunk 100 ft. Timber is being delivered on the dumps of the Colorado Central mine, preparatory to starting development. The Marshall adit will be repaired, while the engine-room will be retimbered.

Georgetown, March 10.

Eagle County

The owners of the Lady Belle claim at Brush creek will ship ore to the Arkansas Valley plant, if the roads are good enough. Another adit is being driven about 100 ft. below the discovery adit, and is in 20 ft., in mixed sandstone and gypsum. J. Bucholz and associates have opened 2 ft. of ore in sandstone in their Flying Dutchman claim, which is about 1200 ft. east from the Lady Belle. The ore is highly mineralized, and samples have been sent to Leadville for assay.

Lake County (Leadville)

Stations at the St. Louis adit, Breece hill, interior shaft, have been completed and driving on the vein opened, when cutting a station at No. 2 level, has been started. From

the 360-ft. level of La Plata, Rock hill, lessees continue to ship the usual quantity of carbonate of zinc. Above the adit-level of the Bullion King, near Breckenridge, a 3-ft. vein has been opened, assaying 38% zinc and 11 oz. silver per ton. An 82-hp. electric hoist has been installed at the Pyrenees, Carbonate hill. A drift west of the Chrysolite shaft, Fryer hill, has been driven into what is like a white porphyry, carrying a fair percentage of silver, and the owners do not know what class of ore they have opened.

TELLER COUNTY (CRIPPLE CREEK)

The Gold King Mining Co. produced 4794 tons of ore in 1912 averaging $15.06 per ton, making $72,211, while the total to date is 91,453 tons, yielding $1,867,816. Dividend No. 19 absorbed $14,053, and the cash on hand at December 31 was $53,066. The suit of the Doctor-Jack Pot Mining Co. against the Work Mining & Milling Co., dealing with the value of the ore wrongfully mined by the latter company, is now being heard at Denver. The annual meeting of the El Paso Consolidated Gold Mining Co. was held at Denver on March 10, and with one exception all old officers were reëlected. The company will pay one-fourth of the cost of the new drainage tunnel for the district.

The last measurement of the flow of water from the Roosevelt tunnel showed 8030 gal. per minute, and there has been a steady drop in the water-level of the Elkton and Mary McKinney mines. T. R. Countryman, engineer for the drainage tunnel, is preparing a report in connection with the proposed lower tunnel.

The decision of the court at Denver is that the Work Mining & Milling Co. must pay the Doctor-Jack Pot Mining Co. $400,000 for ore extracted from the property of the latter.

IDAHO

CUSTER COUNTY

The Lost Packer mine and smelter, which are situated in the mountains about 112 miles from Mackay, the nearest railroad point, are to be operated during the present summer. The mine produces rich copper ore, and stoping is in progress. About 350 horses will be required for the season's work. This company is controlled by Utah people.

CANYON COUNTY

It is reported that a genuine discovery of rich gold ore has been made by E. Pennington eight miles west of Hanedale, with Caldwell as an outfitting point. An adit was driven 200 ft., and then 28 ft. was driven through ore which is heavily mineralized. A shipment will be made to Spokane.

SHOSHONE COUNTY

Deeds for an undivided quarter interest in 33 mining claims near Burke were filed on March 8 by E. R. Day to H. L. Day, president of the Federal Mining Co. At the Coeur d'Alene Vulcan property the adit is in 3192 ft., and two veins were cut on which development will be done as soon as the snow clears away from the district. Work at the Tamarack & Custer property near Wallace has opened ore in No. 4 adit at 700-ft. depth, 2000 ft. in from the portal. This is supposed to be part of the rich shoot mined in the upper workings of the Custer. The Culver Mining Co. has been dissolved and the Amy-Matchless Mining Co. has taken over its Pine creek holdings.

MICHIGAN

HOUGHTON COUNTY

During 1912 the Hancock Copper Mining Co.'s receipts totaled $232,977, and expenditure exceeded this by $34,565. Development was confined principally to sinking No. 2 shaft to 4000 ft. and cutting the necessary stations. Driving on No. 3 lode was done on No. 16, 18, and 27 levels, and cross-cuts driven east from No. 13, 18, 27, and 34 levels. Some work was done on a promising-looking amygdaloid lode cut by No. 18 level cross-cut 735 ft. east of No. 3 lode. It varies from 3 to 8 ft. in width, and is well mineralized 150 ft. south and 50 ft. north. Driving on this lode will be done on No. 13, 27, and 34 levels. As mentioned in these columns last week, a rich lode was cut at 3600-ft. depth. Arrangements were made for crushing 'rock' by the Lake Milling, Smelting & Refining Company.

Copper production of the Lake Superior mines in February was as follows: Baltic, 1,730,000 lb.; Champion, 2,150,000 lb.; Trimountain, 948,000 lb.; Mohawk, 1,320,000 lb.; Wolverine, 766,000 lb.; Franklin, 296,000 lb.; Calumet & Hecla, 4,794,235 lb.; Centennial, 153,010 lb.; Osceola, 1,162,810 lb.; Ahmeek, 1,061,995 lb.; Tamarack, 563,885 lb.; Isle Royale, 534,693 lb.; Allouez, 475,535 lb.; and Superior, 180,573 pounds.

MONTANA

LEWIS AND CLARK COUNTY

The annual meeting of the Barnes-King Development Co. was held at Butte on March 11. The manager, G. T. McGee, stated that the Kendall mine is opening satisfactorily, but the Piegan-Gloster has failed to show as good an orebody as was expected, and a serious cave-in had hindered work. An adit is being driven 400 ft. into the Norman claim to open the old Gloster workings. A 37 days' run was cleaned up prior to March 6, yielding $39,450. The mill at Kendall is treating 100 tons of North Moccasin ore per day, worth $9.71 per ton, with 92% extraction. The cyanide plant is to be further equipped at a cost of $10,000.

SILVERBOW COUNTY

During 1912 the Tuolumne Copper Co. produced 4,716,047 lb. of copper, 131,867 oz. of silver, and 259 oz. of gold from the treatment of 46,683 tons of ore. The first-class ore averaged 7.35% copper and 3.38 oz. of silver, while the second-class ore averaged 4.05% copper and 2.58 oz. of silver per ton. The gross value of production was $739,196, and net returns $415,528. The main shaft was sunk 206 ft. to 2080-ft. depth, and development covered 3353 ft. All ore was from the 1200, 1600, and 1800-ft. levels. On the 2000-ft. level a promising vein was opened, and stoping on the 800-ft. level is yielding good ore. In about 60 days the 2200-ft. level should be started. The new hoist installed is capable of working to a depth of 3500 feet.

YELLOWSTONE COUNTY

Drilling for oil is in progress at Hardin, southeast, and at Silecia, southwest of Billings. The well at the former place will be below 2500 ft. in May. Texas people are interested in the work.

NEVADA

NYE COUNTY

During the past week the Tonopah mines produced 10,735 tons of ore worth $228,424, making the year's total 120,095 tons and $2,521,752. The Tonopah Mining Co. is distributing $400,000 on April 21, making a total of $10,450,000. During February the plant at Millers treated 13,921 tons of ore yielding 208,400 oz. of bullion, and 102 tons of concentrate worth $35,325, the total yield being $200,075 and profit $95,407. The new Belmont mill treated 11,960 tons, yielding 287,700 oz. of bullion, with a profit of $130,147. On No. 7 level of the Jim Butler, a cross-cut from the winze cut 3 ft. of ore, which is thought to be the faulted section of the Fraction vein developed on No. 6 level. The February output was 1887 tons, yielding a profit of $20,393. At Manhattan the Big Four company will erect a larger head-frame and install an electric hoist. The new mill is treating 80 tons per day, and the recovery by amalgamation is 92 per cent.

WHITE PINE COUNTY

Lessees on the Metzgar claim of the Centennial Development Co. have cut high-grade copper ore in a drift from the bottom of its 50-ft. shaft. The vein is 18 in. wide and assays up to 30% copper. A shipment will be made as soon as possible.

OREGON

JOSEPHINE COUNTY

(Special Correspondence.)—The affairs of the Old Channel property, which is one of the largest and best equipped hydraulic mines in Oregon, and has produced steadily for

40 years, are now in a fair way toward settlement, J. F. Reddy, of Medford, having been appointed receiver. For four seasons this property has been in trouble. 'Open weather' has arrived early in southern Oregon this year, and machinery recently ordered for the Galice quartz mine will now be hauled to the property. The Ocean Beach Dredge Co., a Minneapolis corporation holding an extensive area of land, and which has been working at Gold Beach, near the mouth of the Rogue river, for several years, using old-type sluicing methods, is installing a new 'submarine' dredge. It will be equipped with a gasoline power-plant and weigh 50 tons, and is moved from place to place on wheels. Buckets carried on endless chains dip up the sand and deliver it to sluices. This system has been tested for some time past by the company.

Philomath, March 12.

TEXAS

(Special Correspondence.)—The Silver Hill property, adjoining the famous Shafter silver mine, has been purchased by the Presidio Mining Co. The property was recently under option to the Lewisohns, who drilled and sampled it, but did not, apparently, discover sufficient ore to warrant building an independent plant and so did not purchase. The Presidio company at one time operated the property on lease, but some years since abandoned it when the grade of ore fell below the profitable limit for pan-amalgamation. Now that the company is reconstructing its mill and has adopted cyanidation, the property is again valuable. Machinery for the new mill is arriving steadily and is being rapidly placed. The new De la Vergne engine continues to give a good account of itself, and for the past two months ran over 99% of the possible total time, with fuel consumption of 0.4 lb. of oil per horse-power hour.

El Paso, March 12.

UTAH

Juab County

At the Iron Blossom mine, a cage attached to the new hoist dropped 1100 ft., causing considerable damage. On the 1900-ft. level the drift is in quartz, iron, and manganese, and the vein should be reached in a few days. New chutes are being built on the 1000-ft. level of the May Day. Recent assays show the ore here to carry 22 to 30% lead, 7 to 8 oz. silver, and $3.60 to $4 in gold. The Colorado will not ship any more high-grade ore, but will wait the completion of the new Knight mill. The Yankee mine produces six cars of 37% zinc ore per week. Development on the 2000-ft. level is encouraging. Ore shipments from Tintic during the week ended March 15 were 186 cars.

Salt Lake County

The incline shaft of the Yosemite Mines Co., of Bingham, will be completed to the Mascotte adit-level early in April, having a total length of 2200 ft. The raise from the adit is now nearing the bottom of the shaft, which had been sunk to the 900-ft. level. The raise, which will be 1100 ft. long, is in the foot-wall of the Lark-Yosemite vein, and recently cut this 800 ft. above the adit. Lessees mined 932 tons of ore in 1912 and the company's royalty was $2832.

Utah County

According to J. M. Calderwood in the *Deseret Evening News*, there are a number of promising mines in the Santaquin district, which is situated in the Wasatch mountains between Spring lake on the north and York on the south. These mountains are high, and there is abundance of timber available. The rocks are limestone, quartz, and porphyry, and the veins carry lead, zinc, and silver. The active properties are the Peerless, Eva, Union Chief, Nebo, Big Nebo, United Metals, White Dragon, and Santaquin Surprise.

Tooele County

It is reported that within the next few days final operations will be started at the Consolidated Mercur mine, which has produced nearly $15,000,000 in gold and paid $3,445,312 in dividends. The waterworks will be abandoned and the machinery sold. About 200 men will be thrown out of employment.

The Ophir Hill Consolidated company, of Ophir, has just completed the erection of a new power-plant on South Willow creek, consisting of two generators of 400-kw. capacity,

MAP OF UTAH.

direct-connected to a Pelton water-wheel. The mine will now be operated full time.

Washington County

At a depth of 200 ft. the Bull Valley mine shows 2 to 9 ft. of ore carrying gold up to $200 per ton. No. 2 adit has been started in porphyry.

CANADA

British Columbia

The smelter of the Granby company, at Grand Forks, treated 24,485 tons of ore during the first week of March and shipped 433,000 lb. of copper. Philadelphia people have organized a company to operate the Corinth, near New Denver, and it is estimated that a 250-ft. adit will cut the vein. The Silver Hoard mine, of the Ainsworth district, is opening well and produces 10 tons of silver-lead ore per day, for the Trail smelter.

Ontario

(Special Correspondence.)—An interesting situation has been developed following the death of Thomas McAndrews, a miner at the Alexandria mine, who was killed a short time ago through being struck by a falling cross-head. Evidence given by the different witnesses went to show that a number of the regulations of the Mines Act had been disregarded, such as the use of a safety device on the cross-head and the posting of notices prohibiting the men from riding on the bucket. The coroner's jury brought in a verdict of criminal negligence on the part of the management, and immediately following the delivery of the verdict the coroner issued a warrant for the arrest of E. W. Beidler, manager for the company, on a charge of manslaughter. There have lately been a number of accidents at Cobalt, and stricter measures are being taken. Recently the Right-of-Way company was fined $250 and costs for using a cross-head not equipped with a safety device, while the Cobalt Lake company was fined $100 and costs on an action brought by the mine inspector for a breach of the act in using an open hook in hoisting.

Cobalt, March 3.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

D. W. SHANKS is in New York.

C. M. EYE is visiting Grass Valley.

CARR B. NEEL was at Ray recently.

F. H. GALE is visiting San Francisco.

THOMAS T. READ has returned from Arizona.

C. F. SPAULDING has gone to Oregon City, Oregon.

EDMUND JUESSEN has gone to Searchlight, Nevada.

ALFRED T. FRY is at Broken Hill, New South Wales.

J. S. LAWTON has gone to Paramaribo, Dutch Guiana.

NOEL G. HACKNEY is at Trinidad, British West Indies.

J. B. MESTER is at Edmonton, South Alberta, Canada.

H. A. RICHARDS has gone to Maraisburg, Transvaal, South Africa.

JOHN DERN and family have gone to Germany for a vacation trip.

FRANCIS O'BOYLE has gone from Pullman, Washington, to Luning, Nevada.

CLEVELAND H. DODGE is visiting the Phelps-Dodge properties in Arizona.

JAMES S. WROTH is with the Chile Exploration Co. at Chuquicamata, Chile.

CALVIN D. CRAWFORD, of Copper Cliff, Ontario, has gone to Cotint, Massachusetts.

L. M. HARDENBURGH, recently of Hurley, Wisconsin, is now at Ironwood, Michigan.

BERNHARD BRUHN is making a trip around the world, and will return to Honolulu next July.

GEORGE KINGDON will leave the Old Dominion mine to become mine superintendent at Cananea.

L. M. LOOMIS, who has been at New Brunswick, New Jersey, has gone to Philipsburg, Montana.

H. V. WINCHELL will sail from New York for Buenos Aires today to be gone three or four months.

W. J. CAREY and O. R. WHITTAKER are examining the Bonanza mine in Nicaragua for R. J. FRECHEVILLE.

B. A. BOSQUI recently resigned from his position as mill superintendent for the Montana-Tonopah Mining Company.

THE WESTERN PRECIPITATION CO., of Los Angeles, has removed to 1016 West Ninth street from 820 W. P. Story building.

JOHN GALLIVER, who has been at St. Helens, Lancs, England, is now at Fundicion de Huacracocha, Morococha, Peru, South America.

RALPH HAYDEN and ALBERT E. WIGGIN, who have been visiting concentrating and smelting plants in the Southwest, were in San Francisco this week.

E. H. WEBSTER has resigned as assistant manager for the Mother Lode Sheep Creek Mining Co., in British Columbia, and will return to Los Angeles in April.

W. B. CHIDESTER, who was in charge of the Dreisam mine at Tuolumne, California, for the Tonopah Belmont Development Co., has returned to Tonopah.

BASIL D. DAVIS and R. B. ROGERS have formed a partnership for general engineering and construction work, with offices in the Monadnock building, San Francisco.

S. F. SHAW had a fight with the rebels at Charcas, killing nine. One of his own men was injured, but he escaped with the women and children to San Luis Potosi.

J. S. DOUGLAS is to take over the active management for the Cananea Con. M. Co. L. L. RICKETTS will remain as consulting engineer for this and affiliated companies.

E. H. BENJAMIN, NEWTON CLEAVELAND, W. S. NOYES, and H. FOSTER BAIN are to represent the American Institute of Mining Engineers on the Board of Managers for the Panama-Pacific International Engineering Congress. Mr. Benjamin will be chairman of the sub-committee on local affairs.

K. ITO, K. SUOIMOTO, and D. MATSUZAWA, of the Nippon Oil Co., Ltd., have been visiting the California oilfields. They have engaged H. A. HARLEY, C. R. SMITH, C. C. FLETCHER, H. K. WHAT, and PERCY HARRISON to return to Japan with them and enter the service of the Nippon company.

GEORGE E. GUNN, who died at Salt Lake City, March 12, was a partner in the Gunn-Thompson mining partnership which is heavily interested at Ely and Mason Valley, Nevada, Inspiration, Arizona, and elsewhere. Mr. Gunn was formerly an ore buyer for the A. S. & R. Co., but went into business for himself when Ely came to the front. In the later development of the porphyry coppers he was an important factor and his firm dominated a number of the best properties.

Market Reports

LOCAL METAL PRICES

San Francisco, March 20.

Antimony	12—12¾c	Quicksilver (flask)	40
Electrolytic Copper	18—18¼c	Tin	52—53¼c
Pig Lead	4.60—5.55c	Spelter	8—8¼c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES

(By wire from New York.)

NEW YORK, March 20.—Copper is easier on account of re-sale of metal. Lead remains quiet. Spelter prices are easier with a noticeable falling off of demand. Average daily prices for the past week, in cents per pound, based on wholesale transactions, standard brands, are given below.

Date.	Electrolytic Copper.	Lead.	Spelter. St. Louis	Silver, per oz.
Mar. 13	14.75	4.33	6.03	57⅞
" 14	14.75	4.33	5.98	56⅞

Company Reports

NEW YORK & HONDURAS ROSARIO MINING CO.

This company's mine and mill is situated 25 miles east of Tegucigalpa, the capital of Honduras, Central America, and the following notes are from the annual report for the year ended September 30, 1912. Early in September there was a general strike of native miners who demanded higher wages, and it was not until October 29 that everything was in full operation again. During the year, development covered 10,282 ft., against 13,353 ft. in 1911, this being due to shortage of water-power from March to July. The cost of this work was $6.90 per foot, against $6.10 per foot in the previous year. The Buena Ventura, Catalina, Culebra, North, Nueva, Northwest, and Socorro veins produced some good ore, and they are well opened, but as individual producers they can never be of much account. Work on the Candelaria vein has proved a shoot averaging $13 per ton on the lower 100, 200, and 300-ft. levels. The Capitana vein is of limited extent and has been developed 600 ft. above the Pena Blanca level, but has produced a large quantity of high-grade gold ore. The Colonia vein produces high-grade ore from a narrow vein, and the only development to be done is north of and above the lower 300-ft. level. During the year, the Concepcion vein was the source of much good ore from and above the Pena Blanca level. An adit is being driven to open country below this. Ore from the San Miguel vein averaged $15 per ton. The Rosario produces low-grade ore, and is 6 ft. wide for over 200 ft. in blocks 44 to 38. The Crucero crosscut has been stopped until the geologist shall have examined the rock. All the work done this year was in shale, and the last 300 ft. was badly crushed and soft, heavy timbering having been necessary. Stoping, tramming, and timbering costs were $3.76, and total mining costs $7.59 per ton. Ore reserves amount to 164,216 tons averaging $17.65, and 188,500 tons averaging $8.50 per ton. The new mill with 1800-lb. stamps, described in the *Mining and Scientific Press* of December 14, 1912, was started in June and is giving good results. It cost $473,055, and with other construction work a total of $615,043. The San Juancito power-plant, completed in 1911, is of great benefit for the mill, and electric haulage in the mine. Results of the year's work are as follows:

Ore treated, tons	39,258
Yield in silver, ounces	1,387,078
Yield in gold, ounces	6,739
Total value	$944,213
To date	$17,361,956
Mill extraction, per cent	90
Costs:	Per ton.
Mining	$ 7.59
Tramway	0.50
Treatment	3.46
Surface	2.39
Total	$13.94

The new mill operates at 62c. per ton less than the old plant, with about 5% additional extraction.

Net income	$ 179,890
Dividend	30,000
To date	3,090,000
Assets, cash, accounts receivable, bullion, supplies, loan	494,319

MONTANA-TONOPAH MINES COMPANY

This company's year ended August 31, 1912, and the delay in publication of the annual report was due to the financing of the Commonwealth Mining & Milling Co., a subsidiary of the Montana-Tonopah company, whose property is at Pearce, Arizona, and where a 350-ton mill is now being erected. Development at the Tonopah mine covered 10,076 ft., costing $1.35 per ton; and diamond-drilling 1047 ft. at a cost of $3.95 per foot. In connection with the latter work, No. 11 hole was drilled 615 ft., when 300 ft. of rods became fast and it was abandoned. Most of the development work was confined to the southeastern portion of the property, where several good orebodies were opened, while the most important feature was that of the Shaft vein, which produces a large tonnage of ore. It was cut on the 333-ft. level and junctioned with the MacDonald vein, and strikes southeast, dips northeast, and has been opened to the 765-ft. level. The rich shoot on the intermediate level is 300 ft. in length and is divided into two portions by a fault dipping east. The eastern portion of the vein is 5 to 16 ft. wide of rich ore, and the western portion 5 to 8 ft., of fair ore, and a large tonnage has been extracted. At 379 ft. a large stope, 200 ft. long, has been opened, and at 515 ft. the stope is 100 ft. long and 5 ft. wide. On the 765-ft. level low-grade ore was found, and the Shaft vein will be prospected to the northwest. The Martha, Triangle, MacDonald, and South veins produced a considerable tonnage of ore. No. 10 diamond-drill hole passed out of the later andesite into the lower rhyolite and proved this formation to be 1050 ft. thick. No. 12 hole passed out of the andesite into lower rhyolite at 152 ft. below the 765-ft. level. Ore reserves are estimated as 32,000 tons. Following are details of the year's work:

Ore treated, tons	53,874
Yield, gold, ounces	10,162
Yield, silver, ounces	905,032
Concentrate produced, tons	711
Yield, gold, ounces	3,712
Yield, silver, ounces	338,895
Total value of yield	$743,901
Average per ton	$13.80
Mill recovery, by cyanidation, per cent	56.7
Mill recovery, by concentration, per cent	33.3
Total per cent	90.0
Total costs per ton	$8.77
Total revenue	$779,733
Net realization	214,376
Dividends paid	160,000
To date	430,000

During the year, two Trent underfeed agitators were installed, and for the past four months shipment of concentrate to the smelter has been discontinued. This product is now treated direct with the mill product, without lowering the general extraction.

DEXTER WHITE CAPS MINING COMPANY

On January 29 a special meeting of the company was held at Tonopah, Nevada, to decide whether the company should amalgamate with the Associated Milling Co., and the White Caps Leasing Co. of Manhattan, and form a new company with increased capitalization. Of the 440,498 shares represented at the meeting, 50,865 voted in favor and 389,633 against the proposal, so it was lost. Operations of the company from May 1, 1911, to December 31, 1912, and those of the leasing company from May 1, 1911, to January 20, 1913, were given in the report.

The White Caps Leasing Co.'s work was as follows:

Ore treated, tons	9,120
Average value per ton	$23.75
Gross value of ore treated	$216,636
Loss in residue	33,773
Expenses of treatment	58,029
Net returns	124,834
Royalty	17,646
Lease	107,188

The White Caps Mining Co. had $9235 cash on January 1, 1913, balance after paying expenses from $17,646 royalty received from the leasing company.

A report on the property was made by C. D. Wilkinson, who made the following remarks in part: Lessees have opened the mine by three levels, and No. 4 station will soon be cut. The largest stopes are above the 165-ft. level, and the flow of water is about 50,000 gal. per day. There is no ore definitely blocked out, except an irregular mass in the east shoot; but below the 165-ft. level on the east

shoot there is about 4500 tons of ore, worth $12 per ton. Above this level there should be ore worth $40,000; and below the 225-ft. level in the shaft shoot there is 600 tons of $75 ore. All ore on this level is sulphide, and the present treatment at the Associated mill will not be suitable for it, and roasting, followed by cyanide treatment, would probably do. In summing up, Mr. Wilkinson states that the mine has no developed ore; the deposit is irregular and hard to count on in depth; and it is base at depth. There is no reason to expect lower values, and a large shoot should be opened in the shaft orebody. Work since done by the leasing company, whose lease expires on November 1, 1913, shows by winzes that the ore is improving in value at depth.

DALY-JUDGE MINING COMPANY

The report of G. W. Lambourne, general manager for the Daly-Judge M. Co., operating mines at Park City, Utah, for the year 1912 shows the property to be in satisfactory condition. During the year, 9784 ft. of development was accomplished. Production amounted to 62,606 tons, with a net value of $728,381. Dividends to the amount of $225,000 were paid and the year closed with a surplus of $524,570. Improvements in treatment and in the metal market raised the price received for zinc middling from $10.83 in 1911 to $27.93 in 1912. The Snake Creek drainage adit, in which the company is interested, has been driven 5700 ft. and is delivering 6300 gal. of water per minute. Flow of water from this source is expected to afford important power. The company accounts give the cost of concentrating 58,951 tons as averaging $0.72; general expense on ore produced is figured at $0.315, marketing at $1.08, and development, $1.88. The total cost per ton was $6.58. In addition to concentrates, 3655 tons of crude ore was sold. The total yield since incorporation of the company has been $4,343,678. An important feature of the report is a vertical projection in the plane of the Daly fissure. It shows apparently large areas still to be worked, but there are no definite figures of ore reserves.

LE ROI NO. 2, LIMITED

The annual report of this company, which owns mining property in the Rossland district, British Columbia, and an interest in the Van Roi Mining Co., Ltd., which was promoted in 1908 to acquire certain claims in the Slocan district shows that the company mines 40,112 tons of ore and smelted 18,257 tons averaging $20.10 per ton in gold, silver, and copper. Mining and treatment costs totaled $9.23 per ton. At the Van Roi mine, development covered 4488 ft., at a cost of $8.91 per foot. Production was 54,115 tons of ore averaging 15 oz. of silver, 3.66% lead, and 6.26% zinc. Mining costs were $2.58, and concentrating 95c. per ton.

MOTOR-TRUCK HAULAGE is rapidly coming into favor. The New York Telephone Co. has given data showing that the cost of operating single and double teams of horses and wagons is from $5.02 to $8.54 per day; and the cost of hired cartage equivalent to the service performed by a 3-ton motor truck totaled $6300, while that of a 3-ton motor truck, based on the average performance of 10 trucks averaging 10,900 miles each, was $3885. The motor haulage saved $2414 per year. The Eagle Rock Quarry Co. operates a quarry at West Orange, New Jersey, and delivers crushed rock to customers in a 7-ton motor truck. Costs of this haulage, based on 300 working days per year, covering 12,600 miles, with an average load of 6.3 tons per trip, averaged $7.80 per day for fixed charges, and $8.17 for operating charges, a total of $15.98 per day. The average cost per ton was 34c., and per ton-mile 11.4c. One of the heaviest items of expense is the tires, which wear out rapidly when driven over rough roads.

SIX SPIDERS are employed at the Gorgona shops, Panama canal, in spinning thread for the surveyor's transits. It has been found that although the spider web has served its purpose fairly well, when the instruments are used during damp weather, the threads do not remain taut, and platinum wire is to be used in future.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

COAL LANDS—ENTRY FOR BENEFIT OF OTHERS

There is no provision of law requiring an applicant for entry of coal lands to state that such entry is for his sole use and benefit, and such an entry by a qualified person is not invalid because made in part for the benefit of others who are also qualified to make the entry and where there is no purpose to evade the restrictions as to quantity.

United States *v.* Home Coal & Coke Co. (Colorado), 200 Federal, 910. Oct. 21, 1912.

TRESPASS—HELD NOT COMMITTED

Held in an action to recover damages and restrain a trespass on plaintiff's quartz-mining claim, that the evidence sustained findings that plaintiff's claim overlapped a portion of a conflicting placer claim, that the ore taken by the defendant was taken from the overlap, and that plaintiff had made no discovery at the time of his location of his alleged claim.

Olaine *v.* McGraw (California), 129 Pacific, 460. Jan. 2, 1913.

NOTICE OF APPLICATION FOR PATENT—PUBLICATION

The regulations respecting the publication of notice of an application for patent for a mining claim require that the notice shall appear in each issue of the designated newspaper published during the 60-day period prescribed, excluding the first day of publication; and publication in only one issue each week of a tri-weekly newspaper, for the period of 60 days, does not meet the requirements of the statute and regulations.

J. C. S. Mining Co., 41 Land Decisions, 369. Sept. 28, 1912.

CLAY AND LIMESTONE DEPOSITS

The mere fact that land contains deposits of ordinary clay or of limestone, is not in itself sufficient to bring it within the class of mineral lands and thereby exclude it from homestead or other agricultural entry, even though some slight use may be made commercially of such deposits. There may, however, be deposits of clay or limestone of such exceptional nature as to warrant the classification of the lands containing them as mineral lands.

Holman *et al. v.* State of Utah, 41 Land Decisions, 314. July 15, 1912.

SEVERANCE OF MINERALS FROM SURFACE

Where a conveyance of land excepts and reserves to the grantor all mines and minerals, it works a severance between the ownership of the surface, including the limestone thereon, and the minerals, including the gypsum beneath. The owner of surface has no right to remove the minerals without consent of the owner thereof, nor can he, by carrying on mining operations, acquire adverse possession of the minerals remaining in the land. The owner of the minerals, or an undivided interest therein, can maintain an action for injunction to prohibit their removal.

White *v.* Miller (New York), 139 New York Supplement, 660. December 1912.

COAL LEASE CONSTRUED

Where a coal lease granted to the lessee the right to mine coal from beneath three tracts of land, no right was thereby given to tunnel beneath and extract coal from a tract of the grantor's land, not included in the lease, but lying between two of the leased tracts, merely because the coal could be most economically mined in this manner. Such a lease does not authorize the lessee to dump slate and refuse upon the surface of the land unless that right be expressly stated therein.

Brasfield *v.* Burnwell Coal Co. (Alabama), 60 Southern, 382. (Nov. 19, 1912.)

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

GYRATORY ROCK-CRUSHERS use 0.5 hp. per ton of rock crushed per hour.

MERCURY consumption on the Rand is about 0.035 oz. per ton crushed, and at the Homestake mills 0.13 oz. per ton.

TIN-MINING CLAIMS in the Federated Malay States cover an area of over 280,000 acres, and in 1910 the duty on tin exports amounted to $4,002,668.

ASBESTOS SHIPMENTS from nine properties in Quebec in 1912 amounted to 111,175 tons, and the stocks on hand at the end of the year were 24,176 tons.

WOLFRAM occurs in quartz veins in diabase schist at Patterson creek, Lemhi county, Idaho, and a plant of 100-ton daily capacity is being erected to concentrate this ore.

JAPANESE figures of weight and measure may be easily translated by using the following conversion factors: 1 momme = 0.1325 oz.; 1 kin = 1⅓ lb.; 1 kan = 8.28 lb.; 1 koku = 39.7 gallons.

WASHING GRAVEL for diamonds, it is well to remember that hornblende, pyroxene, garnets, sphene, and tourmaline have approximately the same specific gravity as the diamond, namely, 3.52.

TAILING from the Kennedy mill, in Amador county, is to be stored in ponds near the old Bright property, and it is said that four wheels, having a diameter of 56 ft. each, will be used in elevating the pulp to the ponds.

HOISTING ENGINES have three main periods of operation, namely, acceleration, maximum velocity, and retardation. The Ilgner system provides for balancing or equalizing the power used, by means of the energy stored in a heavy fly-wheel.

BERM CRANE 'H,' working at the south end of the west wall of the lower chamber of Miraflores lock, Panama canal, mixed with two 2-cu. yd. mixers, and placed 954 cu. yd. of concrete in 8.33 hours on January 31. This gives an average of 1 cu. yd. each 31.5 seconds, and during one hour, 160 cu. yd. was placed.

RATIO of copper to nickel in the Sudbury deposits is 36.3 parts of the former to 100 parts of the latter in ore, and 83.3 parts to 100 parts in rock in the Creighton mine, based on a large tonnage mined. Analyses of slag and matte show the ratio of nickel to copper to be greater in the latter than the former.

THE MINT at Ottawa coined 494,621 gold coins, valued at $2,685,866, and 41,474,218 silver coins valued at $5,178,768, from January 2, 1908, to February 28, 1912. One result of the mint's operation is that foreign silver coin is being returned to the country of origin, principally the United States. During the year ended March 31, 1912, silver coin worth $1,791,187 was 'deported.'

STATIC HEAT ENERGY may be transformed into kinetic energy in a turbine in three ways: (1) by the impulse turbine, by the expansion of the steam in nozzles, impinging on buckets on the periphery of the turbine wheel, which turns the shaft; (2) by the reaction turbine, by the alternate passage of the steam through revolving and fixed blades the expansion is performed on both sets of blades, the fixed one acting as guides; and (3) by means of a turbine embodying a combination of the first and second systems.

WHEN SAMPLING mines it is necessary that the samples should reveal characteristics of the ore; for example, if in a vein a well mineralized section is found to adjoin barren-looking rock, these should be sampled separately. Alternating bands in a vein should also be so dealt with, and in such cases it is as well to include an inch or more of the apparently barren rock on each side of the more valuable portion. In this way, if there is any enrichment along the contact between the two classes of rock, the metals will be included in the class of material to which they rightly belong.

TUNNEL RIGHTS are dependent upon the work being prosecuted with reasonable diligence. What is reasonable diligence has not been passed upon. Failure to prosecute work on the tunnel for six months loses the right to all blind veins which may be cut later, but not to the tunnel, which may be continued. As the claimant is allowed 1500 ft. in any direction of all blind veins cut throughout the 3000 ft. of his tunnel, he practically commands an area in the shape of a racetrack, 6000 ft. long and 3000 ft. wide. Some have considered that the claimant's rights should be confined to 1500 ft. on each side of the tunnel, making a square 3000 by 3000 ft., but there is no direct reason why he should not receive his 1500 ft. of lode, even if found at one end of the tunnel and striking outside of the square.

AIR used by the blast-furnaces at the Copper Queen smelter, at Douglas, is blown by 11 blowers driven by tandem-compound engines, six blowers being of 300-cu. ft. and five of 200-cu. ft. capacity per revolution. The air from each is piped separately to one furnace, and the quantity of air delivered to a furnace is fixed by the speed of a blower, the pressure adjusting itself to the condition of the furnace. The average pressure is 26 oz. per sq. in. By means of valves, one blower can be used on either of two furnaces, and if necessary all blowers can be connected to a common main pipe. There are six blowing engines for converters, five of 6000-cu. ft. and one of 12,000-cu. ft. capacity per minute. These are cross-compound steam cylinders, and duplex air cylinders. They deliver air at 11 lb. pressure to a common main pipe, their speed being controlled by an air-governor, which varies the speed so as to keep a constant pressure in the main pipe.

AN ICE MINE in Sweden Valley, four miles east of Coudersport, Potter county, Pennsylvania, is a peculiar phenomenon, and has been a source of much interest. Some years ago, two prospectors at Sweden Valley sank a shaft 12 ft. deep, and then abandoned it, noticing at the time a cold draft coming out of the rock. Later on in the spring a considerable amount of ice was found in the 'mine,' and instead of melting in the summer, the ice increased in thickness, while next winter the ice almost disappeared. This peculiar thing occurs regularly every year. In *Popular Science Monthly*, M. O. Andrews explains the mystery of the formation of ice. The pit, 8 by 12 ft., is at the base of a steep hill, and in the spring, the snow on the hillside melts and the water flows into it and is at once frozen. The sides of the pit are of loose shale, in which there are numerous crevices extending back and up into the hill, the rock strata being rather sharply inclined. A draft of cold air, which in places will extinguish a small taper, issues from these fissures in summer, when the temperature of the pit varies between 25 and 32°F. The air must gain access to the fissures at a higher altitude than that of the pit, and it is evident that in winter the column of air directly over the pit is cooler, and consequently heavier than that in the rock passages. It therefore forces its way down into the pit and up through the rock strata, chilling the rocks to a great depth, and storing up a vast quantity of 'cold,' which depends on the character of the winter. In warmer weather the air over the pit becomes heated, and is displaced by the cold heavy air 'flowing' down out of the passages. This cold current freezes any surface water in the pit, and maintains a freezing temperature as long as the supply of 'cold' in the hill lasts, after which the circulation of air ceases, and the ice melts. The temperature of the air as it issues from the crevices remains practically constant throughout the summer, as proved by thermometer readings.

Book Reviews

DETERMINIATIVE MINERALOGY. By J. Volney Lewis. Pp. 151, ill., tables, index. John Wiley & Sons, New York, 1913. For sale by the *Mining and Scientific Press*. Price $1.50.

This volume is elementary in style, and has been prepared primarily for the use of students in mineralogy, although it will meet the needs of a geologist or mining engineer in many cases. The first 62 pages deal with laboratory work and apparatus, reactions of the elements, crystallography, and technical terms; while 68 pages of tables cover tests and details of minerals under the heads of composition, color, streak, hardness, specific gravity, fusibility, crystallization, cleavage, and reactions in testing.

ENGINEERS' HANDBOOK ON PATENTS. By William Macomber. P. 288. Ill., index. Little, Brown & Co., Boston, 1913. For sale by the *Mining and Scientific Press*. Price $2.50.

Over 1,000,000 patents have been issued to inventors in the United States, and the Patent Office is kept busy with fresh applications for others. The author of this volume maintains that the important inventions of the future must be made by trained graduates of engineering schools, with which we do not agree. This work has been prepared in the character of information for students, and presents the theories which underlie certain inventions, and tend to guide the inventor on successful lines, both as to the law and theory of patents. The matter of 'What is Patentable,' in chapter IV, is interesting; and 'Patent Litigation,' in chapter IX, which costs an enormous amount of money, often unnecessarily, will be read with interest. A man who is his own lawyer is a fool; and nobody should be his own patent attorney, so chapter VI, explaining the obtaining of patents, is especially valuable. In connection with the proposed patent law revision, G. H. Montague has written an interesting article for the *Harvard Law Review*, which should be read with the volume under review.

THE DOMES OF NOVA SCOTIA. By T. A. Rickard. Excerpt from *Transactions* of the Institution of Mining and Metallurgy. P. 55. Ill., map. London, England, 1912.

This is an interesting description of certain peculiar formations in the seaward half of the peninsula of Nova Scotia, compiled from the author's notes when inspecting the district in August 1905. The country is traversed by a series of sedimentary rocks into which granite has intruded. The former occur as highly altered beds of quartzite and slate of great age. The region has been subjected to much folding, and the gold-bearing quartz, in following the lines of the country rock, forms 'saddles' where the slate and quartzite have been bent into anticlinal folds; but the most pronounced development of ore is on the 'domes' formed, where folds cross each other. The 'saddles' of Nova Scotia are also remarkable for peculiar large and small corrugations of quartz, which the author has termed 'furrows' and 'crenulations,' respectively. The paper is well illustrated with maps and interesting halftones.

THE SMITHSONIAN INSTITUTION. Annual report of the Board of Regents for the year ended June 30, 1911. P. 688. Ill., map, index. Washington, 1912.

Although somewhat belated in publication, this volume contains a number of interesting articles. The report of the secretary, C. D. Wolcott, covers 91 pages, dealing with the administration of this well known institution, the many explorations and researches made, the library, and astrophysical observatory. An estate valued at $40,000 was given under certain conditions by the late G. W. Poore, of Lowell, Massachusetts; and during the year all structural work at the National Museum was finished. Among the articles published may be mentioned. 'The Gyrostatic Compass,' by H. Marchand; 'Radiotelegraphy,' by G. Marconi; 'What Electro-Chemistry is Accomplishing,' by J. W. Richards; 'Production and Identification of Artificial Precious Stones,' by N. Heaton; 'Some Recent Interesting Developments in Astronomy,' by J. S. Plaskett; 'Geologic Work of Ants in Tropical America,' by J. C. Branner; 'Greater Problems of Biology,' by D'Arcy W. Thompson; 'Some Useful Native Plants of New Mexico,' by P. C. Standley; and 'Discoveries of the Art of Iron Manufacture,' by W. Belck. Included are interesting biographical notices of Robert Koch and Joseph Dalton Hooker.

COAL, AND THE PREVENTION OF EXPLOSIONS AND FIRES IN MINES. By John Harger. P. 183. Ill., index. Longmans, Green & Co., London, 1913. For sale by the *Mining and Scientific Press*. Price $1.25.

The annual coal production of Great Britain is approximately 230,000,000 tons, and the number of men killed in 1911 was 1.18 per 1000 employed; and during the 10 years ended in that year the average number of deaths from explosions was 11% of the total men killed underground. Figures in connection with the coal mining industry of the United States also shows a large number of fatalities from explosions, and the work of the Bureau of Mines in investigating causes and preventives is well known. The subject is important, and both officials and miners should be instructed in the nature of coal, and the chances of accidents arising from mining operations. This volume has been written in a non-technical manner, and should be found of value. The nature of coal and its occluded gases is discussed in chapter I, with analyses of the former, and examples of the 'flow' of gas in certain localities. Chapters II and III deal with combustion and slow oxidation. Air which contains from 14 to 21% oxygen is as good as ordinary air, providing the amount of oxygen does not fall below the minimum required to form the normal amount of oxy-haemoglobin from the venous blood. The subject of respiration is thoroughly described in chapter IV. The succeeding five chapters discusses the rôle of coal dust in explosions, coal-dust explosions, and the prevention of the same. 'Gob-fires,' or the spontaneous combustion of coal, have been the subject of much research, and many mines have had to be shut down on this account. Their phenomena are explained in chapters XI and XII. An appendix contains a few notes on fire-proofing mine timber, and statistical matter in relation to coal mining.

TABLE OF CONTENTS

EDITORIAL

MILWAUKEE has been entertaining the American Chemical Society during the week, and it is safe to say that the discussion of the 150 or more technical papers presented at the meeting was at least not dry.

AT WASHINGTON the younger men on the United States Geological Survey maintain a particularly lively society, once known as the 'Association of Aspiring Assistants,' but later re-christened as the 'Pick and Hammer.' At the annual dinner of this association is worked off all the fun and human interest that naturally must accumulate during a year's writing of serious scientific documents. With a lively recollection of our own privileged participation in earlier dinners we are disposed to agree with the song writer that without the Survey

"Rocks, hills and plains would stew
And chaos reign."

COMPETITION of the Orient in manufacturing is a bugaboo frequently paraded. Having some experience in manufacturing a paper at least, with low wages and high wages, and having seen something of the Far East, we do not take this as seriously as do some of our friends. The old laws that man's wants increase with his earning capacity, and that wages and efficiency remain in at least crude balance, will operate to prevent more than temporary disturbance of conditions. Point to the argument is lent by negotiations now being conducted by Mitsui & Company for purchase of American pig iron for Japan.

TROPICAL conditions impose difficulties in building that are little understood by those of us who live in temperate climes. Mr. R. B. Rogers tells in this issue what some of these are and how they were met in building the new plant for the New York & Honduras Rosario Mining Company near Tegucigalpa. Steep slopes and sudden heavy downpours make foundation work especially difficult. It is related that one mill in the East Indies slipped down the mountain side a number of feet after a tropical storm. Fortunately it was well built and was soon running again. Recently Mr. C. M. Eye told our readers of the difficulties met at the Benguet in the Philippines, and it is said that the American engineers are about ready to abandon the valley route of the famous Baguio road and build on the old Spanish survey up the nose of the mountain. We learn much by travel and for those who must stay at home the careful notes of a traveler gifted with the seeing eye are the best substitute.

MINING for assessments is the title of a recent report on the Comstock written by Mr. Whitman Symmes, in which he describes the "intentional mismanagement" of a "clique of six crooked brokers" controlling the middle and north end mines.

FOLLOWING Mr. Howland Bancroft's general résumé of mining conditions along the west coast of South America, printed in January, we present this week the first of a series of articles on the 'Copper Mines of Chile,' written by Mr. Juan Blanquier, an experienced mining engineer now in the service of the Chilean government. A native of Chile, and a student of mining conditions both at home and abroad, Mr. Blanquier brings to the discussion at once an intimate knowledge of the subject and the point of view developed by answering many inquiries from ill-informed foreigners. The question whether Chile is to resume her place among the leading copper producing countries of the world is a fascinating one, and one worthy of close study.

LEASING the federal oil lands has been proposed as a solution of present and future difficulties. Since much of the petroleum production comes now from leased lands, the general suggestion is not unfavorably received by the oil men. Specific proposals, however, promptly run into difficulties, though they have the merit of focusing discussion. The San Francisco section of the Mining and Metallurgical Society has taken the lead in outlining a set of principles that might guide Congress in framing any leasing law. The plan, which we print this week, is now before the members for discussion. It would be helpful to have the widest criticisms and suggestions for amendment. While no one engineer or group of engineers may expect to evolve an entirely satisfactory system, certainly the engineers as a class will do better than if the framing of a law be left entirely to outsiders.

DISCOVERY of new orebodies at Butte has received much public mention, but of more general importance are the various metallurgical experiments which are now on trial in that district. The Butte & Superior Copper Company has erected an expensive zinc concentrator, and is trying to make a satisfactory saving of exceptionally stubborn zinc ores. A part of the plant is also arranged for flotation, but the progress there is not made public, as the process used is in dispute with the Minerals Separation Company. Electric zinc smelting was also tried in an experimental way, but has apparently been abandoned. The W. A. Clark interests are experimenting on the same problems with zinc ores, but have not yet erected a working plant. The Butte Central Copper Company has built and is operating a concentrator and cyanide plant for ores from the silver veins. Two electrolytic copper leaching plants have been built and are in experimental operation, and as usual the Anaconda company and the Boston & Montana have many experiments in progress. All these things keep Butte agog metallurgically, and if all or any one succeeds, the lease of life of this big mining district will be greatly prolonged.

DIVIDENDS to the amount of $23,839,067 have been paid to date by the Goldfield Consolidated Mines Company, as shown by the annual report reviewed on another page. The production of the company has amounted to $40,136,000, to which is to be added $11,200,000 produced by lessees and $2,700,000 by the constituent companies prior to consolidation. While *finis* is by no means yet to be written in the record, these totals are impressive. The future of the mine calls for especially careful work. The great high-grade bodies of ore have been largely mined out and it is now necessary to work around the edges and on the pillars of old workings. Mr. Albert Burch, who has recently gone to the property, will have no easy task, though one he is excellently qualified to complete. Doubtless a number of small bodies of high-grade ore will be still found and all will at least wish that some small stringer, carefully followed, will lead to a new bonanza.

Gold Production and Securities

The despondent attitude which has been so universal throughout Eastern financial centres during the winter has not begun to change with the coming of spring. On every side the impression seems to prevail and the opinion is expressed that until there is a general liquidation, until accounts are balanced, there will be no general relief. The continuation of gold exports, owing to strained conditions abroad, taken with the political and economic situation at home, has given the financial interests of the Atlantic seaboard a decidedly jangled set of nerves. This feeling has been shown by the disfavor into which a vast number of industrial securities have suddenly fallen. During the past two years, there have been floated in New York and Boston many stock issues, representing all kinds of manufacturing and industrial properties, nearly all of which have been made attractive to the buyer by being put out as preferred stock, returning 7 per cent per annum. It is something of a shock to the recent purchasers of these issues to suddenly find that the banks and bankers refuse to consider them as bankable collateral. There has resulted most disheartening declines, and great depression has seized the public at large. In some quarters it is hinted that the ban suddenly put upon these stocks, which were so popular a few months since, is due to the necessity of providing a market for railroad bonds that must be sold to provide the transportation companies with both new capital and money for refunding purposes. But whatever the cause, it is not a healthy sign that securities of the highest class go begging.

In the meantime the position of India with reference to gold is attracting much attention. During the past 11 months, that is, from April 1912 to and including February 1913, the net imports of gold into India show a total of £23,179,799. For the like period of the year preceding, the total net imports were £21,457,070. The fiscal year in India is from April 1 to April 1, and it is apparent that the imports for that period will total £25,000,000. India's gold absorption during the past two years comes near to being double what it was for the two years

preceding. Taking the past four years as a whole, India has absorbed and practically withdrawn from circulation nearly $400,000,000 of gold in excess of her exports. It is not altogether the loss of this amount of actual gold bars that is of so much importance to the banking forces of the rest of the world, as it is that the fact that this same amount of bullion moving through the regular commercial channels of the Occident would create and furnish a loaning power of $1,200,000,000. Perhaps the tremendous effect of this withdrawal can better be illustrated by saying that so far as the rest of the world is concerned, it is equivalent to the loss of two and a half years' output of the entire world. Mr. George E. Roberts, the Director of the Mint, in a recent annual report predicts that there will be no material increase in the production of gold during the next ten years. This forecast is presumably based upon the predominant position of the Rand. If the production of gold is to be confined to the known places of the world, this prediction might be accepted as conclusive. However, some of the greatest mines in the world have been made where prospectors had traveled the ground over and over, and it is rash to say that new fields as well as new mines will not be found.

Uniting the Institute and the Mining and Metallurgical Society

Plans for bringing the American Institute of Mining Engineers and the Mining and Metallurgical Society of America into union are shortly to be submitted to vote. The project has been repeatedly discussed, almost since the organization of the Society, and we believe that the general sentiment of the members is distinctly favorable. There are differences of opinion as to the best plan of procedure and as to details of the terms of a proper union, but on the whole these differences are surprisingly few. It is widely felt that no good purpose is served by having two entirely distinct national societies, and while the good sense of the officers of the two organizations has heretofore prevented any conflict, there would be abundant opportunity for controversy in the future. In the meantime, the Mining and Metallurgical Society, while doing excellent work, has attained but small membership, and its reports and publications have reached but few people. Its influence has been correspondingly limited. A society that hopes to mold public opinion within and without the profession, must not only formulate and express sound judgments, but must obtain for them adequate publicity. However desirable the *Bulletin* of the Mining and Metallurgical Society may be as a means for holding the membership together, it has been a dismal failure as a medium of publicity. The formal action of the Society has obtained much less recognition than it often deserved, because most men have not known what the action was, or even that any had been taken. The arrangement proposed, whereby the proceedings of the Society are to be printed in the *Bulletin* of the Institute, is therefore one that may well prove greatly to the advantage of the work of the Society.

The Institute has, and will doubtless continue to have, a much larger membership than the Society. We believe this to be right and proper. There should be one great national organization standing on a sufficiently broad base to take in, as Dr. Raymond has well phrased it, "everyone who has clean hands and is interested in mining." Such a heterogeneous membership cannot be expected to get together in any definite consensus of opinion upon either technical or public matters touching the profession. The interests of members are too diverse, and any active propaganda based upon such an opinion, assuming it could be formulated, would be certain to run counter to the welfare of some member. A smaller, more homogeneous body, one in which membership is determined by definite and uniform standards, may, on the other hand, occasionally reach a fairly unanimous conclusion, and, if it do so, the opinion will carry deserved weight. We believe that this is a field of real importance in a country where individualism is fundamental and commercialism is rampant. It is useful in a wide variety of circumstances for an engineer to have for his guidance the deliberately expressed judgment of a body of his fellows. It is well, however, to understand the matter, and such resolutions or rules as may be formulated should not be taken too seriously. In the nature of things they can have no binding force. They are to the engineer what the opinion of one state court is to another, not an obligatory precedent, but acceptable "for the reason that there lies in them." It is the character and the unanimity of the men back of it that gives weight to any opinion in professional matters. The Mining and Metallurgical Society finds its chief excuse for existence in that it affords a means for engineers to get together in the expression of such opinions when the need arises.

The proposed plan of union contemplates that the Society shall become a part of the Institute, but shall maintain its own organization, shall have the right to independent expression of opinion, and shall continue to elect its own members. In the future, however, only members of the Institute shall be eligible to membership in the society, all publication is to be by the Institute, and a part of the annual dues of members of the Society is to go into the Institute treasury. In the main the union is a business affiliation and each institution is left to do its own work in the technical field. As practically all members of the Society are now members of the Institute, the making of membership a pre-requisite is more a change in name than in fact. It is expected that under the new arrangement a number of Institute members who have heretofore held aloof from the Society will join the latter. On the whole we believe both organizations will profit by the union; if anything, the Society has the best of the bargain, but the committees in charge of the negotiations are, we believe, to be congratulated on the fairness of the proposed plan. Certain details have been criticized and some of these have been changed. Others perhaps will be amended before the final steps are taken. Essentially, however, the project is sound and the plan good and we urge all members to vote in its favor.

Building a Mill in Central America

By R. B. Rogers

The general location of the new 200-ton mill and cyanide plant of the New York & Honduras Rosario Mining Co. at San Juancito, Honduras, is shown in the panoramic view heading this and the opposite page. The plant was constructed under the charge of B. D. Davis, whose photographs of the work are here reproduced. The site was chosen with a view to the handling of material by gravity, as far as possible.

All ore broken in the mine is dumped into one of the several chutes in the old Rosario vein, and trammed to the surface, approximately a mile, by 24-in. gauge electric locomotives, on what is called the lower 650 or Rosario level. At the mouth of this adit there was formerly a sorting plant and the head station of a small Halliday single-cable tramway, carrying the ore in 100-lb. buckets to the old mill on the Escobales creek just above the town of San Juancito. The tramway was 6100 ft. long, with a drop of about 1200 ft. Several thousand feet of cross-cutting and sinking has failed to show ore below the Rosario level. The new mill was, therefore, so placed as to receive ore from this level by extending the electric haulage-way 1600 ft. on a ½% grade along the side of the ridge forming the north wall of the canyon in which the Rosario vein outcrops and was originally discovered. It was later found necessary to tunnel behind a particularly steep point where, as shown at the centre of Fig. 1, slides caused considerable difficulty in keeping this road open.

The necessity of building a new mill was taken as an opportunity for a general concentration of all the works. Previously, the main offices, warehouse, machine and electric shops, assay office, quarters for mill and office men, were in San Juancito about two and one-half miles, by road, from the mine. They are now on the side and top of the ridge.

Fig. 1. Electric tram from adit to millsite.

close to the mill, leaving only the two hydro-electric power plants in the valley below—one in San Juancito operating under 1350-ft. head and developing 1200 hp., and the other at Guadalupe, a mile below on the same stream, developing 800 hp. Comfortable houses for married employees were given the preference of site and occupy the top of the ridge, while on the extreme point on the level spot shown in Fig. 1, a large club-house and general mess-hall is to be built. The altitude of 5000 ft., and the isolation from congested native quarters make this a far more healthy location than was to be found in the town of San Juancito.

The general scheme of milling adopted includes no unusual departures from the customary treatment of a silver-gold ore containing sulphides. The varied character of ore found in the complex vein system of the mine has made it possible to keep the percentage of sulphides down below any danger of serious interference with the milling process.

The equipment is perhaps unusually heavy for so isolated a mine. Track scales, a revolving car-dumper, a grizzly, and two gyratory crushers are placed over a flat-bottomed steel ore-bin 500 ft. long by 20 ft. wide and 25 ft. deep. Twenty 1800-lb. stamps, dropping 6 in. 110 times per minute, and equipped with 7-in. cam-shafts, are driven in batteries of 5 and mounted on concrete foundations, a rubber mat coming between the concrete and metal. Wooden battery posts 15 by 30 in. are used. On the preliminary runs, the only vibration to speak of was caused by the jumping of the end of the cam-shaft in the bearing away from the bull-wheel. The anchor-bolts used in the five-ton mortars and the battery-post shoes are 2 in. diameter and extend down into a tunnel about 30 in. square, running lengthwise of the foundations. The roof of the tunnel is 5 ft. below the surface of the foundations. The bolts hang slightly out of plumb, converging toward their lower ends. Four-inch pipes were set in their proper places in the concrete and after the surface of the foundation was dressed down to as nearly a perfect plane as possible, and the mortars placed thereon, the bolts, with a 2-in. pipe sleeve which just fitted smoothly over them, were set and the space between the 4-in. and the 2-in. pipes was grouted in, making a rigid job and yet permitting the removal of a broken bolt. Four-mesh screens

FIG. 2. GENERAL VIEW OF MILL.

are used at the stamps of all the batteries.

Two Dorr classifiers receive the pulp from the stamps and the sand goes to two 5 by 22-ft. tube-mills, thence to a third Dorr classifier which feeds a third tube-mill. There is no classification beyond this, and no trouble has been experienced from sand getting through the last tube-mill. Two Dorr continuous thickeners 10 by 35 ft. and two Hendryx de-waterers 21 by 18 ft. are installed below the crushing machinery.

Eight conical bottom air-agitation vats 45 by 15 ft., connected in such a way that either continuous or intermittent agitation may be used, accomplish the actual solution of the precious metals. Below these are three more Dorr thickeners. Two 90-leaf Merrill slime presses receive the pulp from the thickeners. It was planned to charge the presses with the thickened pulp and run the overflow direct to the gold solution tanks. One of the thickeners has, however, been fitted up as a storage tank in which the pulp may be agitated to prevent settling if better results are obtained in the presses in this way.

Two gold-solution tanks, 10 by 20 ft., are provided and zinc-dust is introduced into the suction of the Aldrich triplex pumps, forcing the solution and precipitate up to the presses in the refinery, which is just above the ore tracks from mine to mill. Four Shriver precipitate presses and six Faber du Faure tilting melting-furnaces, charcoal-fired, are used in the refinery. Aldrich triplex pumps are used for circulating mill solutions. There are four tanks, 20 by 30 ft., for stock solution and water, besides a number of smaller ones used for wash water and sumps. All tanks are of steel plate and all piping throughout the mill was so put in as to give any desired combination for crushing either in water or solution. There is a sub-station in the mill, receiving current at 6600 volts from the power plants. Practically all machinery is individually motor driven; the only exception being the classifiers, thickeners, and machines that require too little power to warrant separate motors.

Difficulties of Construction

The construction of this plant on a slope averaging about 38°, and under tropical conditions of weather, labor, and transportation was begun 15 months from the commencement of active construction work. All the material except lumber and lime was brought in from the Pacific Coast port of Amapala, necessitating trans-shipping there to lighters which carried it to San Lorenzo, the terminal of the 75 miles of national road from the coast to Tegucigalpa, the capital of the country. Apart from the roads built by the Rosario company in the vicinity of the works, this is the only road worthy of the name in Honduras. It is, in general, a fair road and in spots it is a magnificent macadam highway, 30 ft. wide, supported by massive retaining walls, passing over well built masonry bridges, and commanding as beautiful a view of mountain scenery as can be imagined; in fact, well justifying its name of El Camino Real.

From Tegucigalpa to the mines is a distance of about 16 miles over the mountains by an exceedingly rough road with grades as steep as 30% and many 'hair-pin' turns, at which points the question of grade has been forgotten entirely, the object being apparently to turn about as quickly as possible and start on a new zigzag. All freight which is too heavy to come by two-wheeled carts has to be brought over the mountain by the use of block and tackle, time, many yokes of bulls or oxen, urged on by the pandemonium of howls with which the natives endeavor to arouse the animals to greater exertion. In its recent construction work, the Rosario company has not made use of sectionalized machinery, single pieces weighing up to six tons having been brought in for power plants or mill. About 1,500,000 board feet of lumber was delivered from the company's lumber concession 10 miles distant. What lime was used was burned on the property.

Handling Material

Receiving and storing material at the works proved to be one of the most annoying problems. Naturally, in so isolated a district, freight cannot be delivered as needed, and in spite of the greatest efforts to avoid a congestion of material on the hillside, the tube-mill liners and Merrill press parts were among the first items to arrive on the job. Rough platforms were built on the outer edges of the roads in all available spots for the storage of lumber and supplies. Cement and material which might be injured by the torrential rains of the wet season were stored in provisional warehouses. Masonry-lined drainage ditches were built to deflect water from the sites of the mill and other buildings.

Of the preliminary work, the provision of sand was a most serious consideration. The stream beds in the vicinity are so steep that little sand withstands the scouring of the yearly freshets, and the cost of packing sand by mule-back from the valley below was prohibitive, not to mention the poor grade of material delivered by native contractors when this had been tried in the past. Over 5000 tons of sand was required for the concrete and masonry work. Fortunately, there were known to exist long stretches of barren hard white quartz in one of the levels of the mine 450 ft. above the Rosario level, and an old balanced cable skipway on the surface, connecting the mouths of these adits, was in shape for use. A worn out 5-stamp battery from the San Juancito plant was set up at the foot of the skipway, no other foundation than mud-sills being used, and the quartz, mined on contract and lowered in the skips, was run through, using six-mesh screens. The slime in the resulting sand was washed out in a box and the product, which was a sharp, clean, perfect sand for the purpose required, was shoveled into cars and run over to the works as needed. A good quarry was finally located about three-fourths of a mile around the mountain from the sand plant, and track laid to it on the convenient grade of an old flume. Mules were used to deliver the rock, which was a tough, close grained andesite, to the electric haulage way. A ⅓ cu. yd. Smith concrete mixer and a rock-crusher were placed at the head of the mill. Excavations, and bins and chutes were built

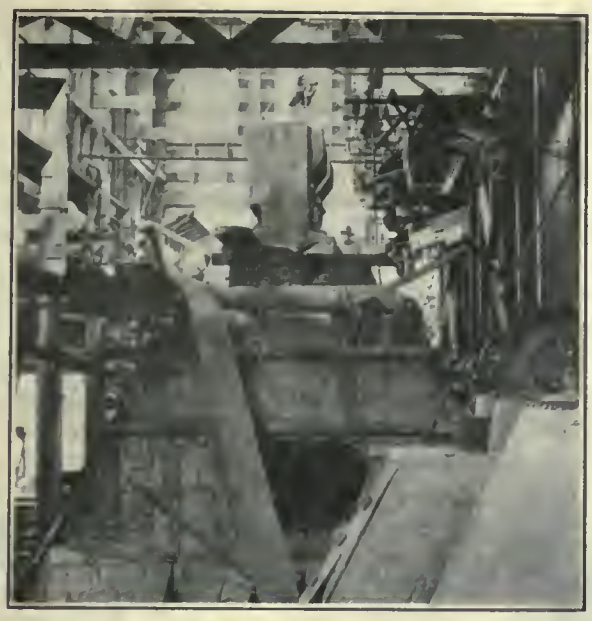

FIG. 3. CONCRETE FOUNDATIONS FOR STAMPS.

for the storage and handling of rock and sand.

The bedrock at the millsite is a shale, much distorted and broken by an underlying igneous rock. The excavation for the ore-bin encountered this shale, dipping into the hill, under about 8 ft. of overburden, and the bin was set far enough into the hill so that its top inner edge stands just on the ground line. A massive reinforced concrete wall 7 ft. thick at the bottom, tapering to 2½ ft. at the top, and flanked by 3-ft. wing-walls, partly surrounds the bin, the top girders of which extend to and rest on piers set upon this wall. The timber superstructure of the mill stands on these girders. The entire mill building is framed from 12 by 12 and 10 by 12 timbers, with correspondingly heavy floor-sills and roof trusses, it being necessary to figure on dry rot and climatic effects, as well as on original strength and stiffness. Corrugated iron roofing and siding is used throughout.

Stamp Foundations

The stamp foundation consists of two blocks of concrete each accommodating two batteries. They are battered on all four sides and heavily reinforced over the tunnel mentioned above. Their outer edge rests on the retaining wall behind the first tube-mill floor. Below this level the shale was found to lie at all angles, in some instances the stratification being exactly parallel to the hillside. Before a retaining wall could be poured, chunks of as much as 50 tons of rock would slip off from the top edge, necessitating the use of shoring, and, in some cases, the pouring of the wall in sections, the joint being made by building the end of the form like a section of stairs on edge, and leaving liberal reinforcing extending through. The base of each retaining wall is set in a footing ditch from 2 to 4 ft. deep and a foot wider than the base of the wall proper.

The old workings of the mine were stripped of half-worn rails with which all walls were heavily reinforced. Rails were placed vertically from 2 to 6 ft. apart, as the case might be, near the back of the wall, and were also laid in horizontally, overlapping at the ends, as the pouring proceeded. Wing-walls were built on both sides of the work to support the retaining walls and keep out mud and water during the wet season. The rapidity with which a torrent of rain will cut gulleys and carry tons of material down such a hillside is surprising.

The site for the cyanide plant was offset about 150 ft. to the east from the centre line of the mill because of the better character of the ground at that point. As originally planned, the agitation vats were to be placed on circular concrete foundations protected by a retaining wall and, in fact, this form of construction was intended for all the lower works. An effort was made to excavate for the first of these walls, that is, the one behind the agitation vats, but due to there being a heavier overburden here than higher up on the hill and without the concrete work above which had made it possible to get in the lower foundations of the mill proper, it was found next to impossible to hold the ground over the required length of 150 ft. The type of foundation shown in Fig. 4 was therefore devised and adopted. The vats, as shown, stand on an arched concrete platform or bridge. The pits for the vertical walls were sunk alternately so that the ground was disturbed no more than necessary, the sides of the excavation being supported through the soil by plank sheathing and 2 by 4-in. stulls, which were knocked out as the wall was poured. The pits were bottomed in solid blue shale, steps being left to avoid unnecessary excavation, and the bottom of the holes were flared out a foot on each side to give an added area of support. The forms were built up to the spring of the arches and when two alternate walls were poured to this level the intermediate pit was dug. It was just an easy day's work to pour one wall, so they contain no weakening joint planes. They are 3 ft. thick by 18 ft. long and of varying height, according to the depth of the pit. The spaces between them are 6 and 7 ft., alternately, the arches coming between two tanks being a foot wider than those under the centre of a tank. The arched floor was put on as fast as the walls were completed. It is 2 ft. thick at the thinnest point, and between each of the tanks, which are set 4 ft. apart, the floor is

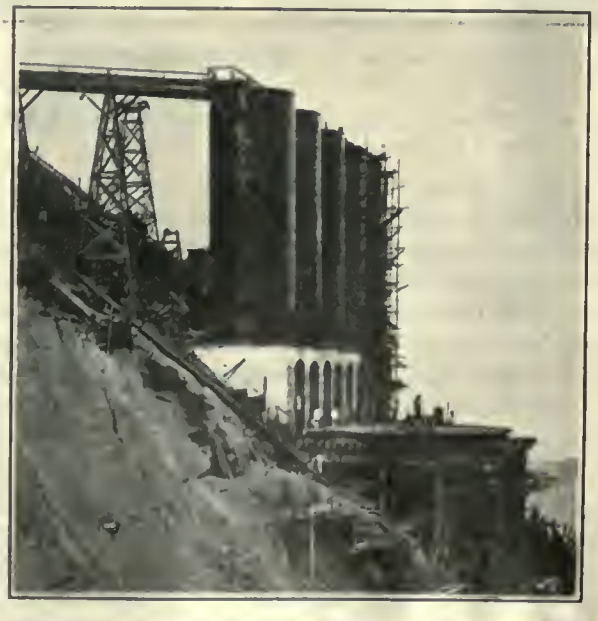

FIG. 4. AGITATING-VATS. NOTE STEEP HILLSIDE FOR BUILDING.

stepped down 4 in. to avoid loss of head by the piping arrangement for continuous agitation. The arches are heavily reinforced and they just clear the ground-line on the uphill side so that there is no tendency for water to accumulate behind the foundations and exert an overturning effect, as in the case of a retaining wall. Under the circumstances, this type of foundation is thought to have solved the difficulty satisfactorily. One American carpenter with several native assistants did the form work, much of which was so designed as to used several times. The completed foundations required a little over 1000 cu. yd. of concrete.

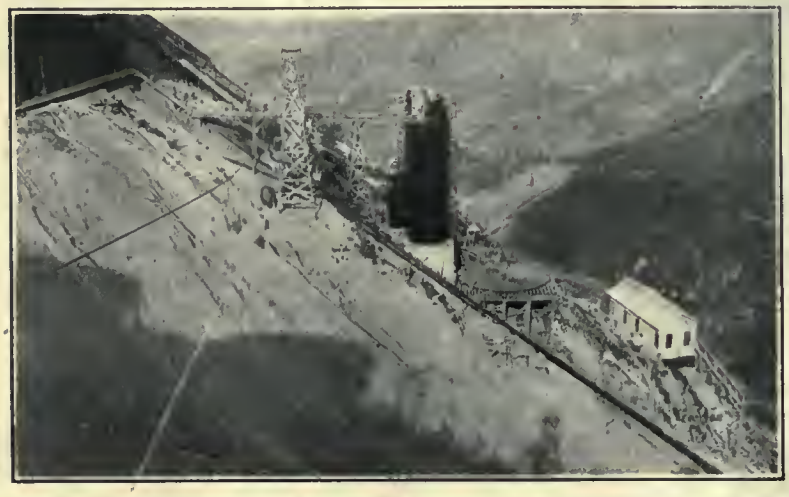

FIG. 5. AGITATING-VAT, FOUNDATION FOR THICKENER, WITH MERRILL PRESSES, AND PRECIPITATING-ROOM BELOW.

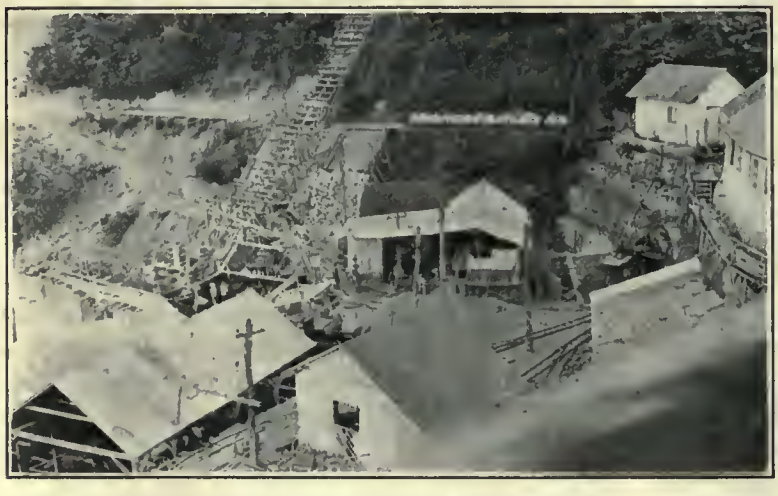

FIG. 6. MOUTH OF ROSARIO ADIT.

For the support of the three 10 by 35-ft. thickeners below the agitation tanks, four lines of concrete piers, resting on bedrock, were put in on 9-ft. centres from the face of the above foundation and in line with the centres of the walls, in the other direction. Posts 14 in. square were set on these piers and capped by 8 by 14-in. stringers running parallel to the hillside. Cross-stringers, 12 by 24 in., one end extending into a pocket left in the face of the wall, carry the 6 by 12-in. sills on which rest the vats. All of this work was heavily cross-braced and bolted to prevent swaying. A structure to carry the roof, tank mechanism, counter-shafting, and motor was erected on this platform.

Where the Merrill presses were placed, bedrock was found considerably nearer the surface. Rather than weaken the ground above by a heavy cut, the presses were set side by side on four piers similar to the vertical walls of the agitation vat foundation but tapering to 18 inches in thickness at the top. An 8-ft. cut was made in the bank for this building in order to reduce the height of the outer press from the ground, and a 7-ft. retaining wall with buttresses to each of the four piers, was put in to hold the bank and support the roof structure, the opposite side of which rests on posts standing on offsets in the main foundation piers. Concrete discharge and rich solution launders were poured, but the floor of the building is of wood. Owing to the alleged killing of cattle by cyanide solution from the old plant, it was necessary to provide for carrying the discharge about a mile by wooden flume to a point from which it will enter the creek below the town of San Juancito.

The two gold-solution tanks rest on a foundation of concrete piers and timber work similar to that built for the thickener tanks, as described above. The piers, however, are put down on 5-ft. centres; 12 by 12-in. posts and stringers were used, and 4 by 12-in. sills carry the tanks, the entire building being above the slope of the ground.

An interesting feature of the foundation work is the fact that all of the 6500 yd. of concrete poured was delivered through wooden chutes lined with old sheets of corrugated iron, from the original site of the mixer, without any handling whatever, except in the case of pouring a great number of small piers, when a receiving box was put in and wheelbarrows used. For all of the retaining walls and larger foundations, the chutes were extended so as to discharge concrete directly into the form. A rather wet mixture was used and a system of baffles was devised to be put in the chute near the point of discharge. This remedied any tendency to separate, which, however, was only noticed in the case of long, straight, steep sections of chute where the larger rocks would tend to leave the mass and roll ahead. Numerous angles in the chute and the baffles produced a well mixed concrete at the forms. Shovelers and tampers working in the forms, and careful supervision of all this work, resulted in exceedingly solid walls and foundations, with few voids. To reach the lowermost foundations the concrete passed through 600 ft. of chute. On all massive work, 'plums' were placed in the concrete. The sharp irregular surfaced rock used for this purpose was washed by hose and well worked into the wet concrete, effecting a considerable economy in cement without materially weakening the work. A mixture of 1-3-5 was used for all machinery foundations, 1-3½-6½ for massive work, and in a few instances as lean a concrete as 1-4-8 was used. This mixture,

however, is too resistant to receive 'plums' satisfactorily, so its economy in this case was doubtful. Rock and other material was lowered as needed, by a skipway built down the hill to one side of the work. The foundations for the 20 by 30-ft. stoek-solution tanks, several hundred feet to the west of the mill (see Fig. 1) were made of masonry, as were also the retaining walls for the refinery, warehouse, offices, and other buildings. Conerete vaults were built in the main office and in the refinery.

The great amount of 'fines' produced at the crusher was screened and used for mortar for masonry work. It was also used as a dressing for the roads about the works, which during wet weather became so slippery that without it, walking up hill was a slow process. As many as 600 natives were employed on the construction when they could be obtained, besides about 30 Americans, including mechanics, riveters, etc. The native labor in the vicinity of San Juaneito is, to say the least, above the average for Latin America. There are many skilful masons, mechanics, carpenters, and miners among the men, due probably to a couple of generations having grown up in and about the Rosario company's works. The recruits, however, who were brought in from the outlying country by scouting parties sent out during the shortage of labor exhibited comical ignorance of the use of a shovel.

Gold Dredging in Russia in 1911

ST. PETERSBURG CORRESPONDENCE

The annual statement has just been issued by the consultative committee of the gold and platinum producers of Russia on the operations of dredges in Russia and Siberia during the year 1911. These statements have been issued annually by the committee since 1906, but more than usual delay has taken place in the present report for which no explanation is given. The probability is that this greater difficulty was experienced in getting the information together. It is not always easy to persuade the dredging companies to furnish such statistics for obvious reasons, and some refuse them altogether. The Permanent Consultative Committee received replies from dredging companies operating 51 dredges. The following statement gives a comparative review for the past five years:

	1907.	1908.	1909.	1910.	1911.
Number of working hours per dredge	2259.23	2502.24	2771.57	2914.93	3026.67
Number of cu. yd. washed per dredge	139,300	166,400	188,805	182,486	212,268
Approximate recovery	$20,235	$25,380	$32,185	$31,357	$37,292

It is shown in the report that the number of working hours per dredge increased from 2914.93 to 3026.67. The average quantity of gravel handled increased about 30,000 cu. yd. and the average recovery about $6000 per dredge. This would indicate both a better manipulation of the dredge and also that the ground worked contained a higher gold content. The average value of the ground worked was 17.5c. per cubic yard, as compared to 16c. for 1910. Of the 51 dredges reporting, 5 produced less than $10,000 each; 15 each from $10,000 to $25,000; 14 from $25,000 to $40,000; 14 from $40,000 to $70,000; and 5 exceeded this latter figure. The dredge reporting the highest recovery produced approximately $160,000. The companies reporting and the number of dredges controlled by each is as follows: Alexandrovsky, 1; Amgun Gold Co., 2; Bogosloff Mining Co., 1; Borovinsk G. Co., 2; Verch-Isset M. Co., 1; Draga Co., 5; Trans-Ural M. Co., 1; Neviansk Factories, 7; Nizhne Tagil Works, 5; Novoudyl G. Co., 1; Platinum Co., 8; Russian G. Co., 2; Savelieff Co., 1; Spassky Co., 1; Sissertsk Co., 1; Fedoroff Co., 9; Shouvaloff Co., 2; Savinnich Co., 1.

The report does not give separate figures for the platinum and the gold produced, so the different amounts of the two metals cannot be obtained. The number of dredges working is less than for the preceding year, but according to the report, greater judgment was exercised in the selection of dredging areas as well as in closing inefficient dredges. The results also show that when the work has been under foreign management the operation has generally been successful. It would have been interesting had the report given the number of dredges of foreign construction, but on account of the high duty on machinery, most of the dredges are of Russian manufacture. The report claims that in addition to improvements in dredge construction the workmen as well as the dredge-masters have shown considerable improvement in their manner of handling the machinery, and that this, in part, accounts for the better results from operations. The production for 1912 will probably show a reduction below that of 1911, partly on account of the strike at the Lena Goldfields and partly because in the Amur region and the Urals the workmen have been withdrawn from the mines by the superior attractions of railway construction on the Amur railway, and the rewards offered by platinum production. Those interested in dredging will be surprised that the number of dredges has fallen off in Russia, where such an immense proportion of the gold produced is from gravel. While one may expect dredging to decline in the Urals where the gold-bearing gravel is approximately exhausted, in the east where practically all the gold produced comes from the placers, it might have been expected that the number of dredges in use would increase.

Southern iron ore deposits are extensive, as was shown by a map compiled by the U. S. Geological Survey for the Southern Commercial Congress. On it large areas were indicated in Missouri, Arkansas, Tennessee, Virginia, West Virginia, and North Carolina, and smaller bodies in Maryland, Alabama, Texas, South Carolina, and Georgia. The output from the ten producing southern states in 1911 was valued at $7,379,267. An estimate of the available iron-ore reserves in the southern states by C. W. Hayes, formerly chief geologist of the Survey, places it at 500,000,000 long tons, together with a much larger quantity of low-grade ore. Copper is produced in seven of the southern states; the value of the 1911 output was $2,455,363.

Copper Mines in Chile—I

By Juan Blanquier

Copper mines have been worked in Chile since the year 1601, and the output of copper kept constantly increasing up to the year 1876, when it reached 52,308 tons. At that time Chile was by far the largest producer of copper in the world. The statistics of the year 1879, for instance, show the following figures for the three largest producers: Chile, 46,422 tons; Spain and Portugal, 33,985; United States, 23,724. Since the year 1882 the United States has taken the lead in copper production, keeping the first place up to the present day.

The copper production of Chile has been without increase for a long period averaging about 45,000 tons per annum for the past five years. This is due principally to two reasons, the first being that no high-grade ore deposits have been discovered during that time, and that the attention of the miners has been turned to the deposits of nitrate of soda, borax, and similar deposits which are easier to work and give greater returns. This does not mean that the copper mines in Chile have been exhausted or that the country is not liable to resume its place among the foremost producers of copper of the world. On the contrary, the actual conditions are exceedingly favorable for an important improvement in the copper industry of the country in the near future.

Before commencing the discussion it may be useful to give some general idea of the country in regard to its geographical situation, climate, resources, and other matters. All the figures given in the present article are taken from official statistics and publications of the Chilean Government.

Constitution and Government

There are three powers in the state: the legislative, the judicial, and the executive. The legislative power is vested in the National Congress, consisting of a Senate and a Chamber of Representatives, both directly elected by popular vote. The judicial power is vested in a High Court of Justice in the capital, seven courts of appeal distributed over the Republic, Tribunals of First Instance in the capitals of departments, and subordinate courts in the districts. The executive power is exercised by the President, elected for a term of five years by indirect vote. The President is assisted in his executive functions by a Council of State, composed of five members appointed by the President, six members chosen by the Congress, and by a Cabinet composed of seven ministers. For the purpose of local government, the Republic is divided into provinces, and the provinces into departments, both under the charge of salaried officials directly appointed by the President.

Finally, I may point out very emphatically that the leading South American Republics, including Chile, Argentina, and Brazil, have strong and stable governments based upon the freedom and equality of their citizens. Revolutionary movements of any kind are unknown in these countries as they are in the United States and the leading European countries.

Area and Population

Chile forms the southwestern part of South America and is a long and narrow strip of land that runs from parallel 10°57′ to 55°59′ south latitude and is bounded on the east by the summit of the great Andes range and on the west by the Pacific ocean. The total length of the country is 2650 miles and its average width a little over 100; the area being about 290.000 square miles. The population is 4,000,000 inhabitants, including 150,000 foreign born residents and 100,000 Indians. The principal towns are Santiago, the capital, with 400,000 inhabitants, and the sea port of Valparaiso, with over 200,000 inhabitants.

Two important mountain ranges, known as the Andes range and Coast range, run parallel from north to south, the entire length of the country. Between the ranges there is a large longitudinal valley. This valley varies in width and is interrupted in some places by tranverse ranges running easterly and westerly. The Andes range forms the natural easterly boundary between Chile and the Argentine Republic. The altitude of the Andes varies considerably; it averages 13,000 ft. in the northern part between parallels 17°51′ and 31°30′ and rises to an average of 17,000 ft. between the latitudes 31°30′ and 34°, where some of the highest peaks are situated; among them being Aeoneagua peak, which is 23,000 ft., the highest peak in either of the American continents. Farther south the altitude of the range decreases gradually to the sea-level when it reaches the Strait of Magellan. The Coast range averages 3300 ft. in height in the northern part of the country. It rises abruptly from the sea coast and its continuity is somewhat broken. It decreases in altitude farther south, and finally ends at the coast in latitude 41°30′, giving origin to a number of islands still farther south.

The longitudinal valley previously referred to runs northerly and southerly between the two ranges above mentioned. It is interrupted by a number of transverse ranges between parallels 29°30′ and 33°, where it resumes its normal southern course again. The altitude of the longitudinal valley decreases from a maximum of 4000 ft. at its north end to 1600 ft. at latitude 33°, from whence it gradually descends to the sea-level in its southern end.

Rivers

There are a great many rivers in Chile, especially in the southern portion, the course of practically all the principal ones being from east to west. They have their sources in the Andes range, forcing their way through the Coast range and empty into the Pacific ocean. In the northern part of the country, down to parallel 27° there are only a few unimportant rivers. The region is desert and there is practically no vegetation with the exception of a few small cases. From parallel 27° down to 42° there are a number of important rivers of permanent

flow, some of them navigable for small steamboats. In this part of the country for a distance of about 1000 miles, 18 big rivers empty into the sea, besides a number of smaller streams. These rivers are more or less uniformly distributed over this 1000 miles.

The water flow is permanent during the entire year, increased, however, in the winter by the rains and in the summer by the melting snows in the mountains. These waters are extensively used in the irrigation of the longitudinal valley above referred to, the soil of which is extremely fertile. There is also practically unlimited opportunity for the development of hydraulic power in these rivers on account of the steepness of the water courses and permanency of flow. There are a few hydro-electric plants in operation, the largest being 24,000 hp., besides a number of smaller ones. The total developed hydro-electric power is estimated at 60,000 hp., 85% of which is used in the towns for lighting, electric traction, and power. Compared with the available water-power, the amount of power actually developed is insignificant. There is a vast field for investment in electro-chemical and other industries, requiring cheap and abundant power because of the existence in the same region of raw materials.

Climate and Natural Products

With the exception of tropical, the climate and natural products of this country are varied on account of the great difference of latitude from north to south and the enormous differences of altitude from east to west, varying from 20,000 ft. in the mountains to sea-level. Regarding the climate, agricultural products, and mineral resources, the country may be conveniently divided into three different sections, or regions, as follows: (1) The north region, extending between parallels 17°57′ and 26° 40′; (2) the central region, extending between latitudes 26°40′ and 40°; (3) the southern region, between latitudes 40° and 55°59′.

The north region is almost entirely a desert, being hot and dry, with rainfalls practically unknown. Agriculture in this region is insignificant. The weather is generally clear and sunny, the temperature being rather high all the year round. The climate is not pleasant, although it is healthy; tropical diseases and fevers being unknown. The mineral resources of this region include deposits of natural salts, especially nitrate of soda, borax, sodium chloride, different kinds of sulphates, potassium salts, etc., of which only nitrate of soda and borax are extensively mined, the output for the year 1911 being: nitrate of soda, 2,454,000 long tons; borax, 44,500 long tons. Gold, silver, copper, iron, manganese, lead, and zinc are mined to some extent, while large deposits of guano and native sulphur are known to exist.

In the central region rain precipitation increases from north to south, being abundant in winter (June, July, and August) and infrequent in summer. The climate is exceedingly mild and pleasant and is considered one of the finest and healthiest in the world. The mean annual temperature averages 59° F. in the valleys, with moderate variations. The weather is also clear and sunny. The soil is very fertile and a variety of agricultural products is grown, including grapes, oranges, and all kinds of fruit which grow in a temperate climate, cereals of every description, tobacco, flax, and others. The mineral resources of this region are principally in its northern part. Included among them are important deposits of gold, silver, copper, iron, manganese, lead, cobalt, zinc, sulphur, lapizlazuli, lime, and gypsum. In the southern part of the same region there are important coal deposits and alluvial gold. Of all the mineral resources mentioned, the copper, iron, lime, or cement rock, and coal deposits are objects of important exploitation, while the remainder are worked only on a small scale, although there are many important deposits known to exist.

Industries and Communications

The southern region is rather cold, with heavy precipitation through the year. Agriculture is carried on to a small extent, while natural forests cover extensive areas of land, the timber industry being important. Sheep are raised extensively in the southern part of the region, and the export of raw wool is considerable. The existence of coal deposits is known. Placer mining for gold is being done to some extent and prospecting for oil is now active.

There are 21,000 miles of serviceable wagon-roads and nearly 1000 miles of inland waterways. The total railroad mileage is 4500 miles, more than half of which is owned and operated by the state. International communication with Argentina and Bolivia are made by three distinct railroad lines. One transcontinental line about 1000 miles long runs from the Chilean port of Valparaiso in the Pacific ocean, to Buenos Aires, the capital of Argentine Republic on the Atlantic ocean. The other two international railroads connect La Paz, the capital of Bolivia, with the two Chilean ports of Antofagasta and Arica. There are three other trans-Andean railroads in course of construction which, when finished, will run from three points on the Chilean coast far into the Argentine Republic and will ultimately reach the Atlantic coast.

Communication with other South American nations, as well as with Europe and the United States, is made by sea. The shortest route between Chile and the United States is by way of the Isthmus of Panama. The trip from New York to Valparaiso takes a little over 19 days, and is made as follows: From New York to Colon (in the Isthmus of Panama), by steamer, 7 days; crossing of the Isthmus of Panama, by rail, 3 hours; from Panama to Valparaiso, by steamer, 12 days. When the Panama canal is open it will be possible to make the trip direct by steamer from New York to Valparaiso in 15 days. The distance is about 5300 miles.

Commerce

The total exports and imports of the Republic of Chile for the year 1911 amounted to $275,000,000 (American gold), of which $140,000,000 was for imports and $135,000,000 for exports. The imports consist principally of machinery of every description, coal, oil, steel, iron, and all sorts of manufactured products. The exports consist principally

of raw materials, including borax, nitrate of soda, iodine, gold, silver, iron and copper ores, blister copper, and agricultural products.

Mining Laws

Mining laws and regulations are liberal in Chile. Deposits of gold, silver, copper, platinum, mercury, lead, zinc, bismuth, cobalt, nickel, tin, antimony, arsenic, iron, chrome, manganese, molybdenum, vanadium, radium, iridium, tungsten, and precious stones may be acquired by location whether situated on public lands or on the private property of an estate. In addition to the metals above enumerated, all fossil deposits, including coal, may also be freely acquired by location if situated on lands belonging to the state or municipalities, but cannot be located if situated on private property.

The state has created a monopoly of all the deposits of guano which exist in Chile and no trade whatever is carried on in this particular product at present. The same conditions exist as to nitrates found on public lands and lands belonging to municipalities, with the exception that lands containing deposits of nitrates may be acquired from the state by purchase at public auction. All alluvial deposits, such as auriferous sands, may be freely acquired by location of claims. Any man or unmarried woman of 21 years of age can take up a metallic mineral claim containing an area of not to exceed 36 acres or an area of not to exceed 120 acres for a claim containing non-metallic minerals. No limit is fixed as to the number of claims which may be owned by corporations. Taxes on mining properties are as follows: For those containing metallic deposits, $0.80 per acre per year; for non-metallic deposits, $0.015 per acre per year: for auriferous sands, $0.082 per acre per year.

When the mineral deposits are located on a private estate, the locator is entitled to occupy and condemn all the land he requires for the convenient working of the mines, for accumulating ores and dumping requirements, for building mills and reduction plants, for accommodations for the workmen, and for wagon-roads and railroads. He is also entitled to use whatever wood and water and grass is required for the men and animals employed. The owner of the estate is, in return, entitled to be indemnified as follows: (1) For the value of the land occupied in the exploitation of the mines and the building of the mills and reduction plants; (2) for the wood, water, and grass used: (3) for the deterioration to the estate resulting from the above operations. Foreigners enjoy exactly the same rights as Chilean citizens for acquiring claims and working mines in this country.

Copper Mining

The total output of copper ore from Chile during an average year (1909) amounted to 500,000 long tons, of an average grade of 9.21%, containing about 100,000,000 lb. copper. This came from 775 different mines. Of this total number of mines, 100 of them produced 375,000 gross tons of ore, while the remainder, that is to say, 675 mines, produced an aggregate of 125,000 long tons. This gives an average output for each mine of 185 long tons per year. These figures give an idea of the great number of copper mines situated in different parts of the country and the insignificant development of each particular mine. Moreover, this number refers only to the mines actually producing, as the total number of copper mines producing and in process of development in the country is 10,821, covering an area of about 90,000 acres.

With the exception of a few important mines, the work is carried on in the most primitive way, no machinery whatever is used, all underground work as well as transportation and outside work is invariably done by human labor, and attention is paid only to high-grade ores. The reasons for the backward condition of the majority of the copper mines in Chile may be stated as follows:

1. Lack of interest of the native capitalists in mining enterprises, the reason for this being that they find investment for their capital in other fields which require less skill and technical knowledge, and which are considered by them to be safer, as for instance, real estate, agriculture, and industries derived from agriculture.
2. Deficiency of transportation facilities.
3. Lack of reduction plants for treating the ores.

Less than one-half of the copper output was actually reduced in the country during 1909, in which year 78,000 long tons of crude ore was exported to Europe or to the United States to be treated. The average grade of these ores was 24.09% and they contained about 42,000,000 lb. of copper. In the same year over 8000 tons of 50% copper matte, containing 9,000,000 lb. of copper, was exported, as well as 45,000,000 lb. of blister copper which was refined in Europe and the United States.

Labor

Over 15,000 men are engaged in copper mining, the average wage per day being $1 and the average work-days in the year 280. From these figures it will be seen that the output of ore per man per day is only 0.119 tons, and the cost of labor $8.40 per ton mined. The labor efficiency is exceedingly poor, due principally to the small scale on which work is conducted and to the fact that, on account of hand sorting, only the high-grade ore is shipped, resulting in sending to the waste pile the great bulk of the ore mined, which is not of sufficient grade to pay its transportation. For the sake of showing what can be obtained from the native labor, when the operations are properly conducted, I may quote some figures published by W. Braden, of the Braden Copper Co., relating to his mining operations, as follows: 174 men, in a 9-hr. shift, using 2¾-in. Ingersoll machine drills, drilled 5082 ft. at a cost of 2.025c. per foot; average drilled per man per day is 29.3 ft. Also, 1008 men engaged in hand drilling, drilled in 9 hr. 13,855 ft. at a cost of 8.2c. per foot: average drilled per man per day, 13.8 ft. The average of ore mined per man per day is 12 tons.

Freight on ores is generally high, due to deficiency in transportation facilities. The average cost for freight per ton of ore from the mines of the interior to the coast is $3.50.

Handling Material in Labor-Wasting Mills

By S. A. Worcester

An observing manager or engineer who pays particular attention to economy of labor can hardly fail to notice that in many mills of comparatively recent construction, much shoveling and hand tramming and other manual labor are practised, in places where simple automatic devices of the most obvious character would save the labor of one to ten or more men. The fact is noticeable that the most recent designs of some engineers of prominence evidence a lack of close attention to the careful reduction of labor costs to the lowest practical minimum. This is due in some cases to the manager's prejudice which prevents the engineer from adopting certain arrangements which he knows to be useful. In the majority of cases it is due to the designer's failure to keep up to date by the use of the best of all text-books, the current technical press.

Shovels v. Cableways

The use of the shovel should be practically eliminated in plants of any considerable size. I have in mind a 100-ton cyanide plant and a 75-ton plant at which the entire tonnage is shoveled three times, also one 75-ton plant at which it is shoveled twice. These mills are of recent design and treat low-grade mine dumps. The ore is first shoveled into cars of about 1600-lb. capacity, then trammed by hand to the mill, where it is shoveled into the crusher. In one mill the crushed ore is trammed to the tanks with a 1600-lb. car. The other two use conveyors for this purpose. In all three mills the charge is leveled with the shovel and shoveled out after leaching. At one 75-ton plant the tailing is shoveled into tram cars and trammed to the dump by hand. In winter, out-door tramming is often obstructed by snow and ice and the tracks need frequent extensions and moving in all weather.

At each of these plants a light cableway, using a drag bucket for excavating the dump and delivering it to the mill, would eliminate the out-door shoveling and hand tramming, track construction, and maintenance, saving about $15 per day at the 100-ton mill and $12 each at the others. At one cyanide plant of 125 tons capacity the ore is mined in an open pit. An inclined hoisting shaft runs beneath the pit, with one or more chutes into which the ore drops and is hoisted by skips. From the skip hoist the ore is trammed by hand to the mill. The situation of this mine and mill is such that a cableway with a digging bucket and a radially movable tail tower would easily excavate the ore and deliver it to the crusher, using one man's labor instead of three, and with a much less expensive plant, eliminating the shaft, raises, chutes, head-frame, and hoisting equipment.

One dump milling plant now in mind, of 500 tons capacity, began operations by running drifts under the dump with raises connecting to the dump and having chutes from which the ore was trammed to the main shaft. Here it is hoisted to surface bins from which it is trammed by electric cars to the mill. When the rock had caved to the angle of repose, it was necessary to have a crew of shovelers throw a large part of the dump into the chutes, thus handling the rock four times in order to deliver it to the mill. Later a drag scraper, drawn by two small single-drum steam hoists standing side by side, was installed for scraping the ore into the chutes. One drum pulled the head rope and the other the tail line which was passed around a movable sheave anchored in the dump. Hand labor was thus finally eliminated, but the system of machine operation is an expensive one. The hoist and scraper outfit are ill adapted to frequent moving, the expense of driving, raising, and chute-making is high, and tramming and hoisting are also expensive, and the system is complicated with many possibilities of break-downs and delays. A traveling cableway with a suitable drag bucket operated by one man would excavate this tonnage with ease and deliver it to the electric surface tram-car, eliminating all manual labor and all underground and hoisting expense.

Another plant of about 300-tons capacity uses a power shovel for excavating the dump, loading it in cars which are hauled by an electric hoist to the crusher. This system involves a constant expense for moving shovel tracks and car tracks, rope guides, and signal wires, and cleaning around the shovel. It employs at least five men in excavating rock and delivering it to the crusher. This particular dump is admirably placed for excavating and delivering the entire tonnage with the labor of one man, by using a radial cableway and suitable digging bucket.

I have in mind a number of concentrating plants designed by engineers of some prominence, in which table and jig concentrates are shoveled and wheeled or trammed from the machines to bins, where any of the simple conveyors now used in other mills for the purpose would do this work admirably and save the labor of one or more men per day. In many mills now employing a man for feeding the crusher, this attendant can be eliminated by using a hopper of ample size, the man who delivers the rock having time to pick out wood, etc., if the plant is well designed.

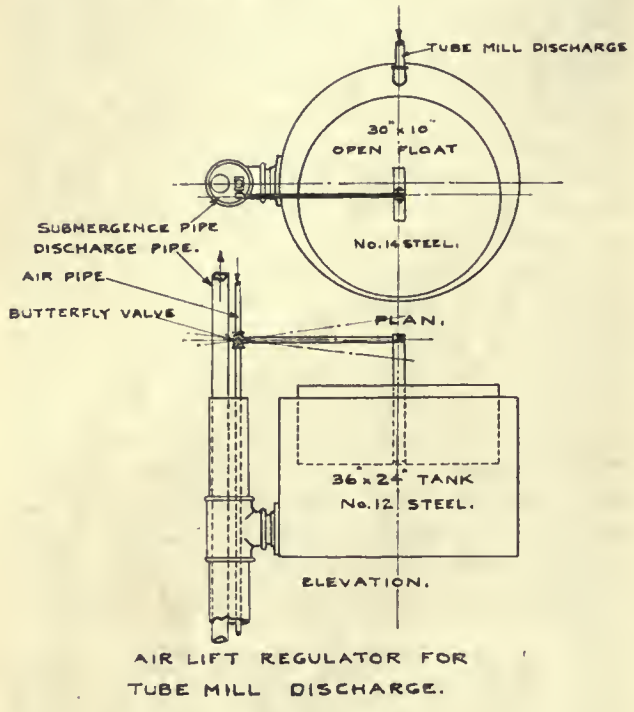
Belt-Conveyors

For delivering sands to leaching tanks, inexpensive belt-conveyors save hand tramming, and a simple excavator, now thoroughly tested, will level the charge automatically, and will discharge the nearly dry tailing through a central gate to a conveyor which will carry it to the stacker. The dry tailing system has the advantage over sluicing of retaining the tailing on the millsite for possible future use, and of avoiding all construction and maintenance of dams and accessories. It avoids damage to neighboring property by tailing, with attendant litigation: this latter item being in many cases one of

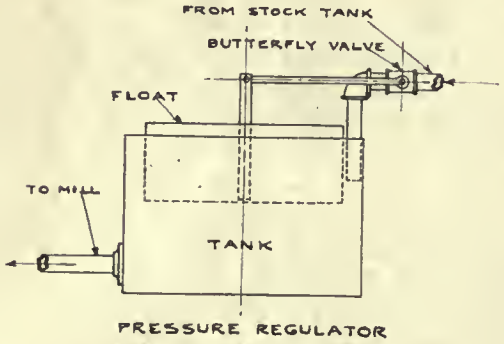
importance. One large plant, for instance, which sluices out tailing, has built several successive dams at great expense for construction and maintenance, and is in almost constant litigation with property-owners along the gulch below the mill.

Another plant discharges tailing having a large amount of moisture and uses dump-cars for carrying the tailing to the dumps. This mill, keeps a large force of men employed most of the time impounding tailing, extending and moving tracks, and building trestles. A well designed cableway would stack semi-dry tailing as high and steep as rock dumps will stand, and would require no track or trestle, and no considerable maintenance. The entire 500 tons per day would be easily handled by one man. The initial cost of the cableway for either of these two mills would be but a small fraction of the amount which has been wasted in labor and maintenance. Another item in favor of semi-dry tailing is the large saving in water, which is a large expense at all of the plants mentioned.

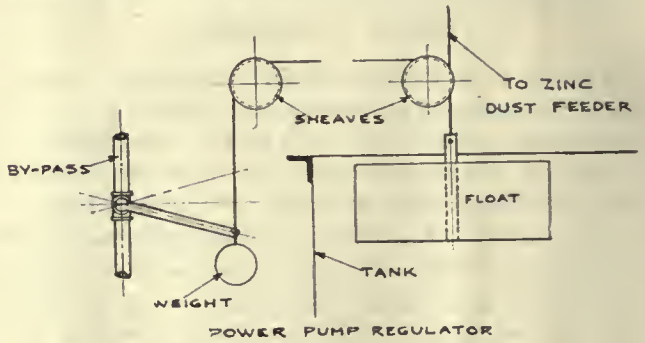
Careful attention to the use of minor automatic devices in and about the mill will often result in saving the labor of several men, besides effecting much more reliable and continuous operation. Floats, for instance, can be used to great advantage for automatically regulating variou soperations. A float which I have used in many places, and which is reliable, is shown above. It is a simple open pan or bucket. Its advantages over closed floats are chiefly that it is less likely to leak and leakage is easily seen and remedied. Also it can be loaded as desired, and is much cheaper than the closed float. The large float shown will carry a load of nearly 100 lb. and will give an effective maximum pull and lift of about that amount. It does not become waterlogged, like the wooden float. Used as a power-pump regulator, this float, placed in the gold-solution tank, maintains a nearly constant level in this tank by opening and closing the bypass leading from the discharge to the suction of the power pump, which has a fixed speed and constant delivery. Besides governing the quantity of solution pumped to the filter-presses for precipitation, this float may also accurately proportion the feed of zinc-dust by being connected to the feeder gate or equivalent device. If it is desirable to maintain the solution level within narrow limits, the bypass valve lever is made short, and if it is more important to have the work of precipitation nearly constant, the valve lever is made long and larger range is allowed for the movement of the float. The feeder connection or lever must, of course, be similarly proportioned.



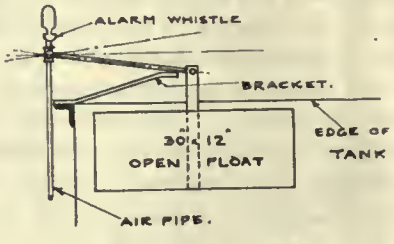
AIR LIFT REGULATOR FOR TUBE MILL DISCHARGE.



PRESSURE REGULATOR FOR MILL SOLUTIONS &c.



POWER PUMP REGULATOR



HIGH LEVEL ALARM.

Used for regulating air-lifts returning pulp in circuit from tube-mills to classifiers, this float economizes compressed air, using just what is necessary to elevate the pulp and preventing any overflow at this point. The float is placed in a small tank, into which the tube-mill discharges, and which in turn discharges to the submergence pipe of the air-lift. Where solution or water is used for classifiers and similar machines requiring careful regulation of the quantity delivered at each point, it is important to preserve a nearly constant pressure, regardless of the fluctuating head in the stock tank. For this purpose, the float, placed in a small tank, and connected to a butterfly or gate valve, as shown, answers admirably.

Where tanks are alternately filled and emptied, the high-level alarm, connected either to a whistle as shown, or to an electric bell, may be used to good advantage, saving many nasty messes and, at times, serious losses and possible stoppages of the plant.

It is obvious that by slight changes the same float can be made to act as both high and low-level alarm.

Inattention to keeping crushing rolls true is a very common cause of wasted power and loss of crushing capacity, with consequent overwork for the screens. If roll housings are provided with suitable openings, and a portable electric grinder of two or more horse-power, mounted on a convenient slide rest, is used frequently, grooving can be almost entirely prevented and the rolls kept up to capacity. This is particularly important for finishing rolls. An efficient dust-remover, such as an exhaust fan connected by pipes to all dust-making machines, and discharging into a dust-house of ample size, is a valuable labor saver, avoiding much sweeping and cleaning and much cutting of bearings in a dry-crushing plant, and necessarily keeping the mill in much better condition than where dust is allowed to fly freely.

One frequent power waste is the use of unnecessarily high pressure for air agitation. As compared with gentle agitation, a violent movement of pulp will not ordinarily give results proportionate to the increased power cost. Careful attention to this item is well worth while. Agitating-vats of large height and small diameter are objectionable on account of the great air-pressure required, also the greater mill height, pumping power, and stair climbing necessary. They require a special high building and cost more per unit of capacity than the tank having height equal to diameter. Experience with the lower agitator has shown it equal in efficiency and much more economical and convenient.

Sand-Filling Stopes at the Witwatersrand Deep Mine

*The sand-filling plant of the Witwatersrand Deep, Ltd., has been operating at full capacity for about five months past. Experimental work commenced 12 months ago, but for some time the quantity of sand lowered was small. About the end of last August, arrangements were sufficiently advanced to allow of despatch of all the current sand, and since then the plant has been handling about 22,000 tons per month, or the whole of the sand leaving the mill, which is about 60% of the tonnage milled by the Witwatersrand Deep, 38,000 tons per month.

The East Rand dike, which traverses the Witwatersrand Deep claims, virtually divides that property into two portions, which are known as the north and south sections. Sand-filling is proceeding in both these portions of the property. In the north section, sand is delivered through a borehole, and in the south section down a winze. Under each row of tanks, conveyor belts are installed, which deliver the sand to two sludge pumps. There the material is mixed with about four times as much water and pumped to the two dewatering stations at the surface. The pulp is pumped to the north station in an 8-in. delivery pipe. Here the sand, mixed with water, is passed into six Caldecott dewatering cones, and is gravitated down a borehole 750 ft. deep. The mixture is freed of much of its water by the Caldecott cones, and enters the mine workings with about 28% of moisture. The system at the south section is similar to that described. In order to guard against the lowering of free cyanide into the mine workings, tests are periodically carried out, and potassium permanganate is fed into the pulp as a neutralizing agent.

The whole installation is working satisfactorily and economically. The surface costs are about the same as those entailed in dumping residue, and the underground costs are only about 4.4c. per ton. Sand-filling has thus increased the ordinary working expenditure by an exceedingly small amount, while it has proved advantageous to the company in two or three ways. The most important gain has been that larger areas of ground have been rendered capable of being worked. By means of sand-filling, pillars and hitherto inaccessible blocks have been brought within the scope of mining. Sand-filling also has bettered the underground workings considerably in regard to safety. In a mine like the Witwatersrand Deep, where the angle of dip of the 'reef' is fairly steep, pillars which have withstood the strain of the superincumbent strata for some years show signs of crushing, and sand-filling assists them in supporting the hanging wall far more effectively than timber.

The amount of water to be mixed with the sand has to be more or less carefully determined. Without sufficient water, distribution underground cannot be effectively carried out, and an excess of water presents the serious disadvantage of having to be pumped out again. This latter consideration is of importance at the Witwatersrand Deep, where recent operations have been much hampered by the large amount of water encountered. At present the company is pumping about 1,500,000 gal. per day, as compared with 2,000,000 gal. a short time ago. It is hoped shortly to reduce this amount, as in a month or two the East Rand Proprietary Mines, adjoining the Witwatersrand Deep on the East Rand, will have powerful new pumping equipment at work, which it is anticipated will relieve the Witwatersrand Deep of much of its present water. This influx is considered to be due to the transverse dike which crosses a corner of the Knights Deep, the Witwatersrand Deep, and the East Rand Proprietary to the Angelo Deep. The management of the Witwatersrand Deep accordingly has had to guard against the accumulation of further quantities of water underground, and the present admixture of about 72 parts sand and 28 water per hundred has been determined to give the best results. The water is pumped back from the Caldecott cones to the sludge pumps in a 12-in. delivery pipe.

*From the *South African Mining Journal.*

Water consumption at Broken Hill, New South Wales, during 1912 amounted to 344,403,800 gal., an increase of 44,277,700 gal. The Broken Hill Water Supply Co. made a profit of $300,000.

Gold Recovery by Volatilization

By Ben Howe

*Most people in Western Australia who are interested in metallurgical problems know by repute the refractory nature of the gold ores of the Gwalia Consolidated mines in the East Murchison goldfield. Lately, a process, of which the application, at any rate, is entirely new to the metallurgy of gold, has been tried on these ores, and bids fair to solve a difficult problem. The process has already passed the laboratory stage, and is running with a small furnace. The results from this have been so consistent and the extraction so good—varying from 92 to 94%, that a large furnace is now being erected.

Briefly stated, the process consists in roasting the ore with a small percentage of salt, whereby the gold is volatilized and passes off as fume. The fumes are led through chambers and drenched with water, which dissolves lime, arsenic, and iron salts in the fume, and leaves the gold suspended in the solution as a black powder. This water is pumped through a filter-press before returning to the chambers to attack more fume. The black gold-slime remains in the filter-press, from which it can be removed at any time and smelted. It is not absolutely necessary to grind the ore very fine before roasting. Ore as coarse as 20-mesh has been successfully volatilized; but the finer the ore the quicker the volatilization. Thus the same ore ground to pass a 100-mesh screen is volatilized in 10 minutes, to 40-mesh in 30 minutes, and to 30-mesh in 50 minutes. It will, therefore, be found, in most cases, cheaper to grind the ore fine than to keep it for a prolonged time in a furnace at a high temperature. The salt may be mixed with the ore dry, or the ore may be wet-crushed in salt water from the mines or salt lakes, and subsequently dried. If the ore is given a rough preliminary roast before the addition of salt, 1 to 2% is sufficient for most ores; but if mixed with the raw ore, more salt, say, 3 to 4%, is necessary.

Type of Furnace

The furnace used is the simple brick-lined rotary type without ribs or other projections inside, with a constant feed at one end and a discharge at the other. The temperature required is about 1000°C., orange to yellow heat, the temperature, in fact, attained in a muffle furnace during cupellation. A higher temperature than this sinters the ore. This is no disadvantage if it occurs at the very discharge of the furnace, but if too high a temperature is carried back into the furnace the ore sinters at this stage and volatilization ceases before the ore is ready for discharge. Any high temperature up to this sintering point is not detrimental to good volatilization, and the sintering is easily observed by the workman and can be avoided. Sintering for even the last quarter of the furnace length only reduces the gold volatilized by about 5 to 7%. A low temperature is quite fatal to good results, as little action seems to take place below a bright red heat. It is advisable to use oil or gas-firing in the furnace; in the first place because the temperature is more easily under control; and again, because the fume, under this mode of firing, is not contaminated with soot as it would be from a wood fire. Only a small draught, just sufficient to carry the fumes through the furnace, is required. In this way the heat is well conserved within the furnace, and the great loss of heat carried into the flues, so characteristic of the many roasting furnaces, is avoided. The water used in breaking down the fumes becomes charged with sulphurous and a little hydrochloric acid, both of which are helpful in taking up the salts of the base metals into solution. Owing to the constant circulation of water, no great heat is experienced in the breaking-down chambers, and wood can be used in their construction.

Laboratory Tests

The laboratory tests to try the suitability of an ore to this treatment are very simply carried out. Two assay tons of the finely ground ore, of which the gold content is known, is mixed with 5% of salt. Either common salt or salt evaporated from mine waters may be used. It is advisable to commence experiments with 5% of salt and gradually work back to find the minimum amount of salt necessary for any particular ore. The mixture is spread out evenly to cover a 4 or 5-in. roasting dish, and then placed at the back of a muffle already heated to a good cupellation temperature. It should remain at this temperature for half an hour without rabbling, or any further attention, and can then be removed, cooled, mixed with the usual fluxes, and assayed in the ordinary manner. The percentage of volatilization of the gold is high, generally over 90%. The charge, on being removed from the muffle, should present the reddish appearance of roasted ore. It will probably have caked slightly by the action of the salt, but can be readily crushed up with a spatula. Should it appear hard and sintered the temperature has probably been too high, and a somewhat low volatilization result will ensue. Care must, however, be taken to keep the muffle hot enough, as low results are noted with a low temperature. The laboratory tests are as simple to carry out as the manipulation of the process itself, and have been found reliable when the ore is put to the test in the rotary furnace. A rabbled furnace of the reverberatory type is not suitable for this process.

Volatilization of gold from ores roasted with salt was noted in chlorination mills, but, as far as I am aware, no attempt to recover the gold was ever made by taking advantage of this action. A similar loss of gold was noted some years ago in the secondary roasting of highly arsenical ores with carbon, though in this case the loss was not so great as when roasting with salt. In 1910, A. T. Fry, a former assayer and chemist of these mines, first observed that the Gwalia ores lost their gold by roasting with salt, but no advantage was taken of this curious volatilization until I took charge of the mine in July last. During the past three months I have worked out the process described above, and have erected a small plant which is at present work-

*From the *Monthly Journal* of the Chamber of Mines, Kalgoorlie.

ing and giving good results. That such great advances have been possible in so short a time is due entirely to the extraordinary simplicity of the process. It seems highly probable that the method of gold recovery will cause radical changes to be made in many Western Australian reduction plants. All ores carrying even small quantities of arsenic and calcite, and these minerals are present in most ores, are amenable to treatment. All ores of this category readily yield their gold by volatilization with salt.

Leasing Oil Lands

The council of the Mining and Metallurgical Society has submitted to the members for discussion and vote the following plan for leasing the federal oil lands. The plan was prepared by a committee from the San Francisco section of the society, but has been modified in the light of discussion of the other sections. It is provisional only and intended to stimulate debate, but has the merit of being a definite and consistent proposal. It happens that M. L. Requa, chairman of the committee in charge, dissents strongly from section 4, and has filed a minority report.

1. There being no laws at present under which oil land can be acquired satisfactorily, a special federal law should be enacted, governing the acquirement of oil, gas, and asphalt lands, and all lands known or reasonably supposed to contain oil, gas, or asphalt should be disposed of only under the terms of the new law.

2. From time to time, as the desirability of maintaining a stable price for oil may in the opinion of the Secretary of the Interor demand, oil, gas, and asphalt lands now reserved or hereafter withdrawn shall be thrown open to entry in blocks of such size as he shall determine. In fixing the size and position of the blocks, he shall recognize the principle that the pioneer may properly be allowed a larger area than the one who follows.

3. Prior to the opening of any lands to entry, they shall be properly surveyed and suitably monumented, and they shall be divided into tracts of 160 acres.

4. Where two or more individuals or corporations desire to lease the same tract of land, the lease shall be allotted by the Secretary upon the basis of competitive bids, the proffers to be in terms of royalty offered, and all royalties to be chargeable and payable in terms of the product. Whenever a lease is thus allotted to a bidder in competition with others, it shall consist of such an acreage as shall be fixed in each particular case by the Secretary; but no lease allotted without competitive bidding shall contain more than 320 acres. No allotment shall be made of any lease or leases unless in the opinion of the Secretary the individual or corporation acquiring the lease shall be financially able to develop the property completely and to care for it during and after development in the manner best calculated to bring about its greatest production and least waste, with due respect to neighboring properties.

5. Successful entrymen shall file with the Secretary a good and sufficient bond to the amount of $10,000 for the faithful performance of the terms of the contract. The Secretary, in making these leases, is empowered, in cases where he thinks it advisable, to substitute for the aforesaid bond of $10,000 either a bond in a less amount or an annual rental for the acreage reserved.

6. Lessees shall commence drilling within a specified and agreed time, and all money expended upon the lease in a bona fide effort to develop oil, gas, or asphalt, or to operate for oil, gas, or asphalt, shall apply to the extinguishment of the bond, and when the total amount so expended equals the amount of the bond, the latter shall be canceled.

7. Transfer of leases shall be valid only upon approval of the Secretary, and he may refuse approval whenever in his judgment such transfer would be contrary to public interest; but he shall not use this power of refusal as a means to exact increased royalty.

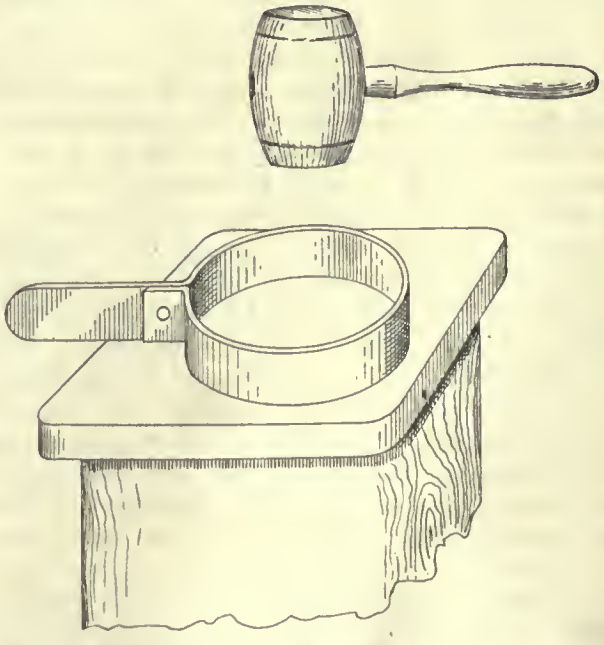
8. The lessee shall drill each year an agreed number of wells or shall keep in operation an agreed number of strings of tools, unless the local price of oil falls below a certain agreed price. If the lessee forfeits a lease, he shall retain his rights in all wells already drilled and may continue to produce from them so long as he pays the agreed royalty, and forfeited leases shall be immediately open to re-letting; provided no drilling shall be done within 300 ft. of an existing well.

9. Line wells must be drilled last, except where it is necessary to protect a lease against adverse drilling.

10. Net revenue from leasing the oil lands should go in large part to the state within which the lands are situated.

Crushing Samples

For breaking down samples, a convenient device is a ring made of strap iron and formed with a handle, as shown above. With this the larger pieces may be raked out and held while being cracked with a hammer.



Gasoline Locomotives for Hauling Ore

By Jesse Simmons

*The ore transportation problem of the Trojan Mining Co., Lawrence county, South Dakota, was that of moving not less than 200 tons of ore per day a distance of 4000 ft., the track to be outdoors, and the ore-bins at the mill at an elevation of 21 ft. above the tracks at the mine. Ore was also to be secured at two other points between the one mentioned and the mill. The problem was solved by H. S. Vincent, manager, who adopted gasoline locomotives, the first to be employed in this service in a gold mine in the United States. Gasoline locomotives are cheaper in first cost of installation than electric or compressed-air machines, the former requiring, in addition to the usual track, an overhead wire for the trolley, or a third rail, and a return circuit, usually effected by bonding the rail joints. When power is purchased from a custom power plant, peak loads are a consideration of importance. In using compressed-air locomotives an air-compressing plant must be provided capable of delivering air at 1000 lb. pressure per square inch, and heavy receivers and pipe-lines must be maintained for its storage and distribution. Small steam-engines probably do not develop the efficiency of the larger machines. That Mr. Vincent's decision was sound is evidenced by the fact that after having one gasoline locomotive in service for the better part of a year, a second was ordered and is now in service. In all essentials it is a duplicate of the first and was manufactured by the Milwaukee Locomotive Co., of Milwaukee, Wisconsin. It is of 7 tons weight and 35 hp. The cylinders are four in number, 6-in. stroke by 6-in. diameter, developing above horsepower at 800 r.p.m. The weight of the engine is 925 lb. Crank-shaft and connecting-rods are of forged steel, with 5 long bearings for the crank-shaft. The main frame is of steel, and the engine is enclosed within a housing of removable steel-wire screens. The drive-wheels are 21 inches in diameter, wheel base 40 in., length over all 11 ft., width 48 in., height 48 in. The working drawbar pull is 2340 lb. at low speed. The transmission is of the enclosed type, having two speeds, 4 and 8 miles per hour, forward or backward. The engine is provided with a hand brake, operating simultaneously on all four wheels, hand or foot operating gong, sander, and a chemical tank for absorbing the odors. The usual load for the locomotive to haul in actual service is 12 carloads of ore, each car being of 22 cu. ft. capacity, or 1 ton of Trojan ore. This load the engine handles over the 2% maximum grade, at high speed, or 8 miles per hour. At 4 miles per hour the load has been increased to 24 cars, which has been easily hauled. Table I gives details of operations of one of the locomotives for a portion of a month.

In addition to the ore handled over the railroad, from the siding a considerable quantity of the supplies for the mill are hauled. These are delivered to the siding over a tramway 1500 ft. in length,

*From the *Pahapasa Quarterly*.

TABLE I

Locomotive Operation for 16 Days in September 1912

	From Decorah...	From siding.....	Total	Average per day.	Per car hauled...	Per ton mile.....
Cars hauled 3297	218	3515	220	.....	.....
Ton miles traveled	..	2580	161.25	.....	.....
Cost of operating:						
Labor .....$		56.00	$3.50	$0.016	$0.021
Supplies:						
Gasoline, 200 gal. @ 22½c		41.00	2.56	.....	.....
Engine oil, 22 gal. @ 30c		6.60	0.41	.....	.....
Black oil, 5 gal. @ 15c.		0.75	0.05	.....	.....
Cup grease, 4 lb. @ 15c.		0.60	0.04	.....	.....
Waste, 6 lb. @ 15c.....		0.90	0.05	.....	.....
Total supplies		49.85	3.11	0.014	0.019
Repairs:						
Material		8.80	...	.....	.....
Labor		11.40	...	.....	.....
Total repairs		20.20	...	0.006	0.009
Total operating cost.....		125.95	7.87	0.036	0.049

conneeting with the C. & N. W. railroad on the hill above. Cars are operated over this tramway by means of an electric hoist. Practically 50% of the mill supplies and repairs are taken to the plant by this means. Owing to the irregularity of deliveries it was impossible to compute the cost of hauling these supplies, henee no account is taken of them in the table. Gasoline for the engine is hauled from Deadwood, a distance of 8 miles, in wagon tanks holding 365 gal. The gasoline is stored at the mine in a buried tank, 54 in. diam. by 10 ft. long, of steel construction.

Grades of Trojan Ore Railroad

Distance, ft.	Grade.	Remarks.
200	level	Decorah mines.
400	+ 0.8%	
800	level	
400	+ 1.0%	
300	level	Siding station
1000	+ 2.0%	
500	− 1.25%	
400	level	Mill-bins; elevation, 6111 ft. above sea-level.

From this table it will be seen that the heaviest grade is 1000 ft. of 2%, and after passing the head of this grade the loaded train strikes 500 ft. of track with a down grade of 1.25%, which is the only grade on the line in favor of the loads. The track is 18-in. gauge, laid with 25-lb. rails on 4 by 6-in. sawed ties spaced 2 ft. apart. Some of the older switches are turned off on a 20-ft. radius, but most of these have been replaced with less abrupt curvature, as the sharp curves were probably a little too much for the locomotive to negotiate without causing strains. At the machine-shop at the top of the hill near the ore-bins, a pit is provided enabling repairmen to get under the machine and make necessary repairs. This is done each Sunday. The locomotives in cold weather are run into a tunnel near the mill where frost cannot reach them during the night.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Extralateral Rights and the Prospector

The Editor:

Sir—I have read with much interest L. C. Campbell's article in your issue of March 8 on the American mining law. It expresses the natural view of the honest lawyer, well and forcibly. But is it the view of the thoughtful miner, or of the mining engineer armed with a proper knowledge and appreciation of the circumstances connected with the search for and location of mineral deposits? I think not. Laws, to operate satisfactorily, must be suitable to the conditions they are intended to control. Mr. Campbell, being a lawyer, and not a miner, cannot be expected to have a correct concept of the individual called a prospector, or of the rôle that he performs in the mining industry. This is clear, for he writes: "The supporters of the extralateral system argue that it is unjust that a prospector should spend his time and money in prospecting for and finding a vein, only to learn later that by its dip it passes beyond his sideline, at which he must cease working."

The advocates of extralateral rights do not hold such an opinion. Far from it. With them the matter is not one of justice or injustice, but of comparative expediency. For they know that the prospector never spends any money working on his claim, because he never has any. And so he never reaches his sideline. In other words, he is an explorer, and not a developer. No; their argument runs about as follows. The prospector is the individual who will wander over the country and search for undiscovered mineral outcrops. He will do it only if the laws governing the location and tenure of mining claims are so arranged as to lead him to think that he can make some money in the occupation by *selling his claim*. The simple and inexpensive method of location of the American mining law, coupled with its apex rights, produces such beliefs in his mind, and he goes out on the search. That is all there is to it. Take away these attractive features and he declines to go. He adopts some other way of gaining a livelihood, and as a consequence the industry of mining languishes because there are no new discoveries except such as are made by pure accident during the progress of work of another kind, such as making a railroad grade or excavating a cellar. That is the way the mining man looks at the problem. Now let us see if the facts in the case will support this view.

There are just two mining regions in the world where a mining title can be initiated in a simple and inexpensive way, and where also the claim carries extralateral rights. These are, in the United States, west of Texas, Oklahoma, Kansas, Nebraska, and the Dakotas, and in Alaska. Are there any prospectors in these places? Yes, thousands of them. Can you find them anywhere else? No. Here is a clear cut issue. Can anyone give the name and address of a prospector (of the class with which we are so familiar in the West, or anything like him) that is at work in Canada, in the United States east of New Mexico, Wyoming, and Montana; in Mexico, Central America, South America, Europe, Asia, Africa, or Oceanica? No. He does not exist in those lands. They have not even a name for him, for the mental conception of his occupation has not yet been formed.

The inference then is plain. Either we must continue to give the prospector his inducement in the way of a simple and inexpensive location procedure, and extralateral rights (or their equivalent in some other form, like bonuses) or else we must say goodbye to him. In such an event exploration will cease as it has elsewhere, and new discoveries will only occur by accident. Will such an outcome be of advantage to the country? There are several other points in Mr. Campbell's excellent paper that I would like to traverse, but time will not permit.

THEO. F. VAN WAGENEN.

Denver, March 12.

[Our readers hardly need the assurance that we dissent strongly from the position taken by Mr. Van Wagenen, which is in effect that there can be no mining development without the special inducements to 'prospecting' that have heretofore been given in the Western United States. Especially do we dissent from the implication that there are no prospectors in Canada, Mexico, Australia, and other great mining countries where the steady development of mines has been as active as in our own country. We shall leave to our Canadian friends the giving of names and addresses, fully assured that they can do so. Once before we printed a letter from Mr. Van Wagenen in which he stated there were no prospectors in Canada, and our mail was a burden for weeks after. As to Australia, our special correspondence letters have repeatedly detailed facts that show that while prospecting is not so active as a few years ago, it needs but the rumor of a 'strike' to bring them in by hordes. Among those still active and hearty is Patrick Hannan, discoverer of Kalgoorlie and still hopeful of finding another goldfield. In Australia it is to be remembered that all boundary planes are vertical, but the absence of extralateral rights does not operate to deter prospectors, nor do they esteem such absence any injustice. Conditions are temporarily unsettled in Mexico, but, while we have never personally prospected in that country, we have listened by the hour to tales of prospecting there told by intimate and veracious friends, and in many countries of South America staking and prospecting is as active as in the United States. One needs but a short stay at any hotel in Lima, Santiago, Rio de Janeiro, or even Toronto to learn that the man with a claim to sell is much in evidence. It is a common fallacy to assume that the old way is the only way and that things cannot be different because we have never known them to be. It is into this error, in our judgment, that our correspondent has fallen.—EDITOR.]

Labor in the Mines of Western America

The Editor:

Sir—I note with interest what H. F. Davis has to say in regard to the college men and miners, in his article on 'Labor in the Mines of Western America,' published in the February 1 issue of your paper. Under this heading he says that "It is neither neeessary nor desirable that the graduate should learn to be a praetieal miner. It is unneeessary beeause the duties of superintendent or manager, for which he has prepared himself at the expense of several years work and some thousands of dollars, do not require it; undesirable beeause to learn 'praetieal mining' well enough to properly do the work of a shift boss in any kind of a mine it will require not less than from four to five years actual underground work in several mines."

In order to more thoroughly understand the position which I take, that a superintendent should be a praetieal miner, it may be as well to define the duties of a mining superintendent as I see them. A superintendent should have absolute eontrol over all mining operations, from the time the ore is drilled up to the time it is shipped to the mill or smelter, and should eontrol all attendant operations as well. This, of eourse, is aeeomplished through bosses in the various departments. For instanee, the maehinery and men neeessary for the operations of hoisting, air eompressing, blaeksmithing, and maehine and other repairing, will be under the master meehanie; all earpenter work, under the boss earpenter; the ore-house under the head sorter; and lastly the underground work under the foreman.

The underground labor and attendant expenses amount to 80% or more of the total eost, the amount varying aeeording to the hardness of the roek, width of stopes, and other faetors, and on this aeeount it is desirable that the superintendent should devote the greater part of his time to this work. In order to be sueeessful in his position he must be thoroughly aequainted with his work and should have had enough praetieal experience to know a shift's work when he sees one and should proeure a good foreman to look after the details of the work for him. He should also be able to fill the position of foreman at any time if that worthy should be siek or quit unexpeetedly. The superintendent who relies upon his foreman for all his praetieal knowledge is going up against a hard 'row to hoe,' as model foremen are hard to get and hard to keep; most of them oeeupy a superintendent's position.

The green 'Sehool of Mines man' knows nothing about handling labor, and the only way of seeuring this knowledge is to work with the miners and get their views upon shift-bosses, foremen, superintendents, and mining affairs in general. This in itself is a great eduеation, and the man who follows it will graduate with a greatly reduеed opinion of his ability and, in nine eases out of ten, a more truthful one. Then, too, the miner has a greater respeet for the man who has had a thorough praetieal training, as they know he understands and makes allowanees for the diffieulties and drawbaeks ineident to their ealling.

A eertain superintendent, who had never worked underground, but who had been in the superintendent's offiee for some time, went into a stope in his mine and said to the maehine man, "Why did you drill so many holes today, you know that it will shake up the whole eountry when you shoot," not realizing that the holes would not be shot all at the same instant; as a result the footage drilled per man per shift was greatly reduеed in all parts of the mine and the superintendent beeame a butt for all kinds of jokes among his men.

Of eourse if a superintendent eares to delegate all authority for underground work to his foreman, the position he oeeupies would easily be filled by a 'Sehool of Mines' man or any person with eommon sense and a little business ability.

Mr. Davis also says that the superintendent should hire no men for use underground without consulting his foreman. I believe that the superintendent should always hire the men working under him, taking adviee from his foreman as he sees fit, for in this way he has an aeeurate knowledge of the personnel of the erew and avoids a mine filled with men of one nationality. This is a eommon fault with the ordinary foreman, if he happens to be a Cornishman the erew is mostly eomposed of Cornishmen; if a Swede the Swedes are the predominant miners in his foree, and so on. The shift-bosses should have power to diseharge any man in the erews working under them, and no appeal from this deeision should be eonsidered except in ease of manifest injustiee to the miner, and then it is time to look for a new shift-boss.

E. A. Colburn, Jr.

Vietor, Colorado, February 27.

Water-power now going to waste at The Dalles of the Columbia is to be utilized by a plant whieh it is proposed to eonstruet 90 miles east of Portland and 180 miles above the mouth of the Columbia river. A report by J. H. Lewis, State Engineer, estimates 300,000 hp. eontinuously, and 236,000 hp. additional, available for 8 months in the year. The present ehannel of the Columbia is to be elosed by a dam 300 ft. long and 180 ft. high, and a new channel exeavated in solid roek 1400 ft. wide. The drainage area at this point is 236,800 square miles, and available water averages 235,000 see-ft. with 73 and 42-ft. head at low and high water, respeetively. The power-plant would be on the Washington side of the river and eontain 21 turbines supplied by a canal 20 by 300 ft., 15 miles from the dam. Turbines would be of maximum eapaeity of 32,000 hp. each at 80 r.p.m. of the vertieal type with generator on top. The eost is estimated at $77 per horse-power for 300,000 hp. and eost of produeing low-tension power at the station, $6.90 per year.

Gold production of Queensland in January was 20,591 fine ounees; Vietoria, 27,232 oz.; Western Australia, 104,705 oz., and New Zealand, 30,942 oz. The value of minerals, other than gold, exported from Western Australia in 1912 was: copper, $290,000; tin, $335,000; silver, $76,000; silver-lead ore, $105,000; eoal and other minerals, $485,000. The February output of Western Australia was 100,987 ounees.

Special Correspondence

LONDON

CORNISH TIN MINING.—CHINESE ENG. & M. CO.

Cornwall mining is passing through a period of low-grade ore production. The Dolcoath report for the half-year ended December 31 provides several 'records.' The amount of ore treated (60,631 tons), the total receipts (£119,487), the profit (£46,569), and the average price received per ton of concentrate (£137 10s.) are all the highest; while, on the other hand, the yield of black tin per ton is the lowest, being only 32 lb. The reduction in the working cost per ton from 25s. 3d. to 21s. 1d. is welcome; it is due chiefly to the greater amount of ore raised and also to the efficiency of the new hoisting and crushing plant. The report of R. Arthur Thomas shows that developments at depth are disappointing, and that the deep levels tapped by the Williams vertical shaft have not responded as was expected. The Carn Brea & Tincroft has also a tale to tell about a record low content of the ore mined during the latter half of 1912, the figure being 21 lb. of black tin per ton. E. S. King, who has introduced so many wholesome reforms during the past eighteen months, and provided the funds therefor out of revenue, at the same time earning a divisible profit for the shareholders, has not had fortune on his side in the way of useful discoveries of high-grade or even medium-grade ore. What would have happened to the mine if the price of tin had not been maintained continuously at a high level, is more than even Mr. King would care to contemplate. However, the yield per ton is greater than that of two other active mines, namely, East Pool and Falmouth Consolidated. But the greatest event that has happened in Cornwall within my recollection is the provision of the capital for an entirely new plant for Carn Brea & Tincroft by the ground landlord, Lord Clifden. It was due to his action, as advised by his agent, John Gilbert, that a clean sweep of old-fashioned ideas was made two years ago, and a modern manager, E. S. King, appointed. He has shown what he can do, as recorded above, and the time has now arrived when he is to be provided with an up-to-date plant for crushing and concentrating. Lord Clifden owns much property in Cornwall, and derives a handsome income also from the china-clay industry, which, by the way, pays far better than tin-mining. He and his agent study the principles and practice of mining keenly, from the world-wide point of view, and are cognizant of the mechanical and chemical improvements whereby low-grade ores of all sorts from gold to tin can be made to yield a profit. The money is to be advanced as a loan at low interest, and the fact that it is not to be raised by stockbrokers is another matter for congratulation.

MAP OF CORNWALL.

The South Crofty is also passing through a period of disappointing development, and at the meeting of shareholders, both the chairman, Francis Allen, and the manager, Josiah Paull, had the uncomfortable duty of confessing that, in spite of vigorous exploration, the ore recently disclosed had been of low grade. The returns for 1912 showed a decrease in the yield of all the metals, tin, wolfram, and arsenic. The presence of specular iron has caused trouble in obtaining a high-class wolfram concentrate, but Mr. Paull has been able to remedy this. The high price of tin was sufficient to maintain the total yearly profit. The figures for 1912 are so interesting that I quote them in detail. During the year 66,076 tons of ore was raised and treated, yielding 627 tons of black tin, 130 tons of wolfram concentrate, and 986 tons of arsenic compounds. The receipts from the sale of these products were £82,481, £11,147, and £9886, respectively. The yield per ton was 21.28 lb. black tin, 4.42 lb. wolfram, and 33.45 lb. arsenic compounds, and the receipts per ton were 24s. 11d., 3s. 4d., and 3s., respectively, or a total yield per ton of 31s. 4d. The production shows a decrease all round, as compared with 1911, when 63,882 tons of ore yielded 677 tons of tin concentrate, 148 tons of wolfram concentrate, and 1008 tons of arsenic compounds. The income per ton in 1911 was 31s. 6d. The working cost per ton in 1912 was 22s. 6d., as compared with 20s. 2d. in 1911. The total income during 1912 from the sale of produce was £103,071, and the net profit was £25,201. Out of this, £20,000 has been distributed as dividend, being at the rate of 40% on the nominal capital, though it must be remembered that the bulk of shareholders who subscribed in cash paid £4 for each £1 share. The sum of £5000 has been transferred to reserve, which now stands at £25,000. The directors have invested £6839 of this reserve fund in bonds of the Chinese Engineering & Mining Co., and in bonds of the Cuba Railroad Co., but they have refrained from any further investment of such funds until a resolution has been passed by shareholders enabling them to invest in any security they may select. At the meeting they were badly beaten and were instructed to put their reserve fund in future to deposit with bankers.

TORONTO, CANADA

MINERAL PRODUCTION SHOWS INCREASE.—MEETING OF CANADIAN MINING INSTITUTE.—DEMANDS MINISTER OF MINES. NEW OFFICERS.—B. C. COPPER.

The preliminary report of the mineral production of Canada during 1912, by John McLeish, chief of the Division of Mineral Resources and Statistics of the Canadian Department of Mines, issued subject to revision, shows an increase of about 29% over the output of 1911. The total value was $133,127,489, as compared with $103,220,994. Of last year's output, $61,177,989 was metallic and $71,949,500 non-metallic. The only new camp of importance contributing largely to the year's output was Porcupine, the gold production of which was $1,745,292. The total gold production was $12,559,443, as compared with $9,781,077 in 1911. Silver showed a slight decrease in quantity, the output being 31,931,710 fine ounces, as against 32,559,044 oz., but owing to higher prices the value showed an increase from $17,355,272 in 1911 to $19,425,656. The total shipments of ore and concentrate from Cobalt and the adjacent mines were approximately 25,684,082 oz., in addition to which 4,773,878 oz. was shipped as bullion. There is practically no recovery of refined copper in Canada, the production being represented by the copper contents of smelter products, matte, blister-copper, and the amount of copper contained in ores exported but which is estimated as recoverable. On this basis the production was 77,775,000 lb., valued at $12,700,311, as compared with 55,648,011 lb., valued at $6,886,989, in 1911. Quebec province is credited

with a production of 3,225,523 lb., as against 2,436,190 lb., due to increased production from the pyritic ores of the eastern townships. Ontario's production was 22,250,601 lb., as compared with 17,932,263 lb. in 1911, mainly derived from the nickel-copper ores of the Sudbury district, where mining and smelting were carried on with greatly increased activity. The total production of nickel-copper in 1912 was 41,925 tons, valued by the producers at the smelters at $6,303,102, an increase of nearly 20% over the output of the previous year. The nickel contents amounted to 44,841,542 lb., valued at $13,452,463. The total production of lead was 35,763,472 lb., valued at $1,597,554, as against 23,784,969 lb. of the value of $827,717. The shipments were practically all from British Columbia mines. Complete returns of iron-ore production had not been received, but shipments from Canadian mines were estimated at about 175,000, as compared with 210,344 tons in 1911. Shipments from the Wabana mines, Newfoundland, by the two Canadian companies operating there were 1,331,912 tons, of which 956,459 tons was shipped to Sydney, N. S., and 375,453 to the United States and Europe. The production of pig iron in Canadian blast-furnaces was 1,014,587, valued at approximately $14,550,900, as compared with 917,535 tons valued at $12,307,125 in 1911. Of last year's output 256,191 tons was classed as bessemer, 544,534 tons as basic, and 213,862 tons as foundry and miscellaneous. There was also a production in electric furnaces of 7834 tons of ferro-alloys valued at $465,225, as compared with 7507 tons, valued at $376,404, in 1911. The production of coal showed a very large increase over 1911, as in that year production was considerably reduced owing to a protracted strike in western Canada, and exceeded all former outputs. It amounted to 14,699,953 tons, valued at $36,349,299, as against 11,323,388 tons, valued at $26,467,646, in 1911. The output of oven coke was 1,411,219 tons, valued at $5,352,520, as against 935,651 tons, valued at $3,630,410. The production of petroleum has shown a steady decline for the past five years, the output for 1912 being 243,336 bbl., valued at $345,050, as compared with 291,092 bbl., valued at $357,073. Cement shows a considerable increase, the production being 7,120,787 bbl. of the value of $9,083,216, as compared with 5,692,915 bbl., valued at $7,644,537, in 1911. The report notes that a feature of much interest during the year has been the continued and extended development of ore reserves. The satisfactory results from these operations, particularly in the case of the nickel-copper ores of the Sudbury district, the Porcupine gold ores of Ontario, and a number of the copper and lead deposits of British Columbia point to much greater annual outputs in the future.

The annual convention of the Canadian Mining Institute was held at Ottawa March 5 to 7, with a fair attendance, A. E. Barlow of Montreal, the president, occupying the chair. The Duke of Connaught opened the convention with an address congratulating the delegates on the growth of the mining industry and the good work done by the Institute. During the convention many valuable papers were read and discussed. The most important question considered was a resolution in favor of making the Department of Mines independent under its own minister instead of its being as at present subsidiary to the State Department, which was negatived after a full discussion. The following officers were elected: president, Alfred E. Barlow, Montreal; vice-presidents, Thomas Cantley, New Glasgow, N. S., and G. G. S. Lindsey, Toronto; councillors, M. L. Baker, Kingston; J. A. Bancroft, Montreal; W. R. Brock, Ottawa; D. H. Browne, Copper Cliff, Ontario; E. T. Corkill, Toronto; T. Denis, Quebec; F. Dulieux, Montreal; James McEvoy, Toronto; Lewis Stockett, Calgary; and W. A. Williams, Grand Forks, British Columbia.

Among copper stocks the weakness in 'British Columbia' has been something of an unexplained feature. The financial statement to be presented at the postponed annual meeting is understood to show a balance in the treasury available for dividends of more than $425,000. To pay the regular dividend requires a little less than $300,000. There seems to be no reason to anticipate any change in the rate of the distribution to the stockholders, and while the market weakness has been pronounced, there has on the other hand been some good averaging by holders thought to be connected with the Newman Erb interests in the company.

FAIRBANKS, ALASKA

WILLOW CREEK MINES ACTIVE.—TOLOVANO MILL CRUSHING.—LITIGATION.—DOME CREEK FIND.

By tracing rich float, Moore & Meyers have discovered a very promising vein on Willow creek, a tributary of upper Ester creek. A shaft has already been sunk 50 ft., with the vein still showing up well. Cross-cutting and driving on this level will be carried on now to prospect the oreshoot. While the new mill is not yet in operation, steady development work on their Ester creek property is being rushed by the Hudson Bros. and other owners of the property, including Mike Beegler, Charles Koegley, Jim Elwell, and Tommy Hilling. Ted Hudson reports the showing as promising at present, although the mill will not be started until constant operation is assured by ore reserves. Last week Keegan & Cole, lessees on the Wild Rose, of upper Dome creek, brought in their first clean-up since work was started. This amounted to $930, showing the ore crushed to average $40 per ton in free gold. Better rock

TOLOVANO MINE.

has been opened up lately, and the next clean-up is expected to be much larger. The operation of the new 2-stamp mill has been hindered by lack of water and improper placing of foundations for building and machinery. What was thought to be solid formation proved to be but frost. This lease adjoins the one being worked by Mr. Spalding, from which considerable money has been taken the past season. Alois Friedrichs has resumed work lately on his Ridgetop property and has already tapped the oreshoot found on the surface. Driving on the 50-ft. level has uncovered a good width of ore, assaying from $44 to $120 per ton. A shipment will probably be made soon, as considerable ore has been broken and the property is crossed by the railroad. After a shut-down of several weeks, the Tolovana mill is again crushing steadily on ore taken out by lessees who are opening up a new vein some distance from the main workings. While much good ore is available in the old workings, considerable water has made the directors decide to wait until summer before continuing work.

Suit brought by Fred Fey against Graham, Bosh & McDonough to quiet title to the property claimed by both at the head of Fairbanks creek has been set for next April. It is to be hoped that some settlement will be reached, as the property is a promising one and should not remain idle. The suit to quiet title of the Keystone Fraction between Smith Bros. and owners of the Happy Home Association is now being tried. This rich piece of placer ground lies between the Daly Bench and that part of the Happy Home Association worked by Ed. Homer last season on Eva creek. Above the old Homer lay, a rich block of ground is now being taken out by the present laymen, who

are assured of a successful season by the richness of the ground and the benefit of former experience in handling heavy thawed ground.

The same number of pay-streak extensions seem to be showing up as usual this season. The extension of the rich pay on 4 Above Fairbanks creek has been found by Freeman & Larson. The ground is said to go $2.50 per square foot of bedrock, and the depth of 17 ft. makes it a good open-cut proposition with cheap costs of working.

Extension of the Dome creek pay has been evidently picked up on the Shakespeare Association at the mouth of Dome creek. Pay-ore has also been found at last on Happy creek in the Ester district on the other side of the divide, and several lays have been let. Cripple creek also promises to produce considerable this season, as the Keystone drill has found good pay and several sets of laymen are now bedrocking their working shafts. Some pay has been found on 28 below Goldstream, and although water was not available for sinking last fall, several hundred dollars has been rocked out during prospecting operations. Good indications are also showing on No. 27 Below, where a hole is about to be bedrocked.

JOHANNESBURG, TRANSVAAL

INCREASED TONNAGE.—STAMPS IDLE.—COAL RATES AND PRODUCTION.—COPPER AND TIN MINES.

According to the figures issued at different times during the year by the Chamber of Mines, no less than 29,163,802 tons of rock was mined on the Rand in 1912 and 25,486,361 tons sent to the mills. This is another marked increase in the tonnage milled as compared with the previous year, when the total was 23,888,260, and, judging from what is likely to occur in the Far East Rand and along the Rand generally in the rearrangement of the mills during the current twelve months, an even higher tonnage may be expected. The number of stamps at work during the year on the Rand averaged 9449, but stamps are not increasing as rapidly as tube-mills, which on the average are given as numbering 262. It is not long ago that 30 stamps to one tube-mill was considered a fair proportion, but at one mine today one tube-mill serves only a dozen stamps, and one of the principal groups, after experiments, has adopted as the best proportion one tube-mill to 15 stamps. The duty per stamp under these circumstances must be expected to increase, and last year averaged 8.39 tons per stamp per day throughout the whole of the Rand. The Chamber of Mines figures give the output of gold on the Rand as 8,753,568 oz., value £37,182,795, the recovery being thus 6.82 dwt. per ton milled. The working costs for the whole of the year averaged 18s. 8d. per ton, an increase of 8d. as compared with the previous year. Several of the new producers and others who have contributed largely to the increased production during the year have not worked cheaply by any means, such as, for instance, the City Deep and Bantjes, while working costs at the Geldenhuis Deep have been abnormally high. Then none of the three principal amalgamated producers—Randfontein, Crown, and East Rand Proprietary—have been able to work as economically as last year; in fact, the last named was some five shillings per ton higher, and this will explain why working costs per ton during the year on the average have been higher. It was officially anticipated that the August reduction of railway rates on coal would make a marked difference on the working costs at the gold mines, and December at 18s. per ton constituted the lowest working cost for the year, but the costs of working have so consistently risen during the past three years despite the increased tonnage milled, that it seems difficult to foresee how the costs are likely to be reduced below those for December. The working profit per ton is given at 10s. per ton and the total profit as £12,678,095, but then the whole of this working cost is not available for dividends, some portion of it being utilized to meet capital and other charges.

Among the miscellaneous minerals produced in the Transvaal, after gold and diamonds, coal ranks first in importance, the feature of the Transvaal coal trade being that as output increases year by year prices as steadily decline. Last year the collieries produced 4,340,219 tons of saleable coal which sold at an average pit top price of 4s. 4d. per ton. In the previous year the output was 3,997,130 tons, and the average selling price, as published by the Chamber of Mines, was 4s. 11d. per ton. Both copper and tin show marked declines during the year, for in 1912 the shipments of concentrates only amounted to 1343 tons, as compared with 2090 tons during the preceding year. There is only one copper mine at work in the Transvaal. It is the Messina and is situated in the northern extremity of the Transvaal, close to the southern bounday of Rhodesia. It is without any means of railway transport, but as a line is now under construction to the mine, attention during the year has been given more to development than mining, hence the smaller output. The Messina mine is a promising property, and is opening in a satisfactory manner. Whether the Messina district will ever become a large producer of copper it is difficult to say. Indications of the existence of copper are numerous in the northern Transvaal, but outside the Messina, wherever so far opened, they have proved disappointing. Last year's tin mining in the Transvaal was also anything but satisfactory, the shipments having fallen from 3373 tons in 1911 to 2726 tons last year and the value from £395,472 to £338,897 despite the rise in the market price of tin. For some of the decline the unusual drought is responsible, but more is probably due to the erratic mode of occurrence of tin in the Zaaiplaats district, and to the fact that in 1911 the Zaaiplaats output was unduly forced. The erratic method of the tin occurrences in the Waterburg district militates considerably against successful tin mining; many are the instances of failure, and it almost looks as though tin mining in the future in this district will make but little progress. The Transvaal Consolidated Lands have been at work for years prospecting their different farms along what is known as the tin belt, but although they have erected a mill, have not yet succeeded in finding a permanent payable tin deposit either in the shape of a lode or pipe. Rich deposits have been found frequently, but nothing permanent either in width or value and the predicted boom for Waterburg tin seems more distant than ever. The Rooiberg field, farther south, has more permanent features, and in that neighborhood the prospects of establishing a tin mining industry are far more encouraging.

NEW YORK

CHILEAN IRON.—CANANEA CHANGES.—DIVIDENDS.

The week ended March 22 with a despondent tone prevailing throughout the East, part of which was undoubtedly due to the Easter holidays and the unwillingness to risk committments for a four-day interval.

The iron ore properties recently mentioned as having been acquired by the Bethlehem Steel Co., of which Charles M. Schwab is the head, are to be operated by the Bethlehem Chile Iron Mines Co., recently incorporated under the laws of Delaware. The new concern is already in the market to make a long time contract for the transportation of the ore, but it is anticipated that in view of the present demand for bottoms of all kinds, the new company will be obliged to construct its own fleet of steamers. It is interesting to note that part of Mr. Schwab's recent statement in regard to the property, in which he says "the valuable and extensive iron ore lands obtained by the company [the Bethlehem Steel Co.] in Chile contain about 67% of iron, or 17% more than the average of the present Lake Superior ores." The officers and engineers of the Bethlehem Steel Company consider this acquisition one of the most important developments in its history."

The C. K. N. Mining Co. of Cripple Creek, originally known as the Cripple Creek Gold Mining Co., has a new executive head in one of the society leaders of the old town of Mount Vernon, N. Y. The new president of the company is Miss Olive L. Granfield, whose father, the founder of the company, was fatally injured in an automobile accident in Colorado a short time ago. The new president will find

one of her chief duties, as such official, the defending of a suit for $1,000,000 brought by the El Paso company, the head of the new $25,000,000 merger recently formed, the stock of which is now being distributed throughout the East. The recent report of the El Paso company just available shows a net profit for 1912 operations of $218,914.

The continual tendency of the copper interests to narrow the circle of the controlling factors and to make closer relationships between the various groups, is instanced in a rather important manner in the recent acceptance by James Douglas of the vice-presidency and general managership of the Greene-Cananea Copper company. Mr. Douglas is the son of the James Douglas, who has for so many years been identified with the Phelps-Dodge organization, and who is in fact a chief among the men who have made history in the development of the copper industry in the United States and Mexico. The staff of the Greene-Cananea is to be further augmented by the appointment of George Kingdon as assistant to Mr. Douglas. Mr. Kingdon has been for many years mining superintendent of the Old Dominion. L. D. Ricketts continues as president and consulting engineer of the Greene-Cananea organization. The Black Hills Copper Co., controlled by Pittsburg interests operating properties in Yavapai county, Arizona, is about to make a $250,000 bond issue, in order to provide working capital and enable the management to resume and push development.

The copper market is mostly marking time. The Amalgamated people are said to have recently sold 50,000 tons at 15c. for export, cleaning up its production to the first of May. Practically all the business done during the week was at the price mentioned. Regular dividends have been declared by the North Butte Mining Co., which will pay 50c. per share April 4; by the Ahmeek Mining Co., which will pay $7 per share April 10; by the Osceola Consolidated, which will pay $3 per share April 30; by the Phelps-Dodge Co., which will pay $2.50 per share March 28; by the United Globe Mines, which will pay $7.50 per share April 7.

MIAMI, ARIZONA

FEBRUARY PRODUCTION.—NEW CONSTRUCTION.—BLACK WARRIOR SHIPMENTS.—MOLYBDENUM AND VANADIUM.

The Inspiration Consolidated Copper Co.'s development work for February amounted to 5220 ft. for the Inspiration division and 600 ft. for the Live Oak division, a total of 5820 ft., showing an increase of 520 for the Inspiration and 110 for the Live Oak over the January footage. At the Inspiration division a total of 20,400 tons of ore was mined, of which 9000 tons was hoisted at the Joe Bush shaft. At the Live Oak division 2430 tons of waste and 370 tons of ore were hoisted at Live Oak No. 2 shaft and 2100 tons of waste at Live Oak No. 1 shaft. A total of 360 men are employed in the mining department, 300 at Inspiration and 60 at Live Oak.

The further development of the Miami orebody is being carried on by two churn-drills and diamond-drilling. The site for the new lumber yard and warehouse which is being constructed necessitates a fill of 2000 cu. yd. At the Southwestern Miami, drilling is steadily progressing, and the management expresses complete satisfaction with the results of the past developments. Hole No. 4 is now 755 ft. deep, No. 11 is 870 ft. deep, and No. 14 is 500 ft. deep. All three holes are bottomed in schist.

The Old Dominion is making the steady progress which has characterized this company under the present management. Ore reserves are being constantly increased and extensive development is being carried on. Late shipment of steel is retarding the construction program of the new units to the mill. At the Buckeye, one of the outlying properties of the Old Dominion which as yet has made no underground connections with the older workings of the property, ten men are at work raising and driving. At the Arizona Commercial Co.'s Copper Hill shaft work is progressing favorably. The shaft has now reached a point below the 900-ft. level, and sinking is being continued. Development is being carried on by driving on the 700 and 800-ft. levels. Driving on the 700-ft. level has not as yet reached the boundary of the orebody previously discovered. There are 50 men in the employ of the company.

At the Superior & Boston, drifts are being driven east and west on the sixth level. The vein is over 40 ft. wide and is ore bearing throughout, with 15 ft. of ore that averages better than 7% along the foot-wall side and 25 ft. on the hanging that will probably run 2½ to 3% copper. A car of ore per day from the raise and the sixth level drifts is being shipped to the El Paso smelter. Mining conditions are excellent. J. A. Thomas, formerly in the employ of the Old Dominion, has made an examination of the property and has reported favorably.

At the Black Warrior work is being carried on at a steady pace. Shipments are being made at the rate of about 100 tons of ore per day to the El Paso smelter. The ore is silicious and runs about 7% copper. The working force, recently curtailed on account of bad weather, has been increased to its normal number of 50 men. The new Inspiration branch railroad to the main Inspiration shafts passes

MAP OF ARIZONA.

within a hundred feet of the Warrior ore-bins, and, if satisfactory shipping concessions can be arranged, should materially increase the shipping capacity of the Warrior company.

The Jahns Mining Co., about 12 miles west of Miami, is soon to resume operation. The property is in a faulted zone showing lead, silver, gold, and copper. The country rock consists of limestone, quartzite, and granite, which has been shattered by intrusions of diabase. The group consists of 31 claims, being bordered by the Continental on the northeast and the Castle Dome on the east. H. Jahns is general manager for the company and is now at the property.

The shaft of the New State, in which high-grade lead ore carrying molybdenum and vanadium was discovered last year and which was the cause of much favorable comment throughout the district, is reported to have been sunk on patented ground of the Continental group. The Continental group is the property of the Old Dominion. The Old Dominon option on the Castle Dome, adjoining the Continental, expired on March 1. The option was for $200,000. The Gibson Copper Co., which has been curtailing output on account of lack of fuel, caused by the recent stormy weather, will use oil burners. The fuel used at present is of wood hauled by Mexican wood-choppers from the Pinal mountains. Development is daily exposing and materially increasing the present ore reserve. It is reported that the high-tension power line that is being strung from Roosevelt to Superior may be utilized at the Gibson, thus reducing the present cost of production.

General Mining News

ALASKA

Cordova

Congress at Washington has voted $100,000 for the construction of a Federal building at Cordova, in which will be all the administrative offices.

Arrangements have been made to ship copper ore next winter from the property of the Mother Lode Mines Co., which is situated about a half-mile northeast of the Bonanza. A tramway and receiving-bin are to be built, timber having arrived for this purpose. The Kuskalina Copper Co. has two shifts working in No. 3 adit, which is 6 by 8 ft. in the clear. The ore in this adit is equal in copper content to No. 1 and 2 adits. The Great Northern Development Co., Alaska United Copper Exploration Co., and others are preparing to resume work at their mines. The Kennecott Mines Co. is erecting a building near the mine and repairing its tramway. It is stated that over 600 men will be employed during the summer. Trains are now running regularly to Kennecott.

Fairbanks

Fairbanks creek and tributaries are busy, and about 30 different parties are taking out gravel and getting ready for extensive summer work. The Tolovana mill of 2 Nissen stamps crushed about 70 tons of ore from a new vein opened to 100-ft. depth in the Tolovana holdings. The Chena stamp-mill crushed 300 tons, averaging $16 per ton, from the 100-ft. level of the Rainbow mine on Skoogey gulch. This level has been driven 300 ft. At a depth of 156 ft. coarse gold has been found in the Alabama claim, and there is yet a width of 200 ft. to prospect. A one-eighth interest in the Reliance Mining Co. has been sold to L. C. Hess by D. Cascaden, this being the first big deal in quartz claims this year. The Spalding mill on 9 Above, Dome creek, is crushing rich ore from the 50-ft. level of the Soo and Waterbury claims. Fourteen tons of ore from the Foster-Hungerford lease on the Empire group, on Chatham creek, averaged $40 per ton at the Pioneer mill. A shipment of 25 tons of ore will be made from the Homestake claims on Wolf creek, to either the Rexall or Newsboy mills. A drift off the main adit has been driven on the vein for 210 ft. The adit cut it at 315 ft., and has since been driven to 750 ft. The last crushing averaged $77 per ton. J. Paulsen, on lower Dome creek, passed through gravel at a depth of 161 ft. The Rexall property on Wolf creek is being operated again with Allan Cunningham in charge. A vein 3 ft. wide is being driven on. Gravel yielding up to $30 per square foot has been found by Adolph Bock on Sullivan creek in the Hot Springs district. The gravel is said to be 100 ft. wide.

In the Koyukuk region there are about 300 men at work, and all are doing fairly well. Returned prospectors state that nothing has been found in the Novi country to warrant favorable mention.

Juneau

During February the Alaska Treadwell mills crushed 65,912 tons of ore, yielding $84,894 from amalgamation and $71,727 from cyaniding 1295 tons of concentrate. Operating expenses were $78,309 and construction $3568, and the net profit was $72,741. The average per ton milled was $2.37. Development covered 580 ft. and the stock of broken ore increased 3887 tons.

The Alaska Mexican mill crushed 17,598 tons of ore during February, yielding a total of $32,086 from amalgamation and cyanidation of 372 tons of concentrate. Operating expenses were $21,761, and construction, $1561, leaving a profit of $8763. Development covered 218 ft., and the stock of broken ore decreased 9961 tons.

Ketchikan

The Princeton Mining & Milling Co. has installed a mill at its property near Ketchikan. The plant consists of a crusher, 5 stamps, slow-speed Chilean mill, and Deister tables. The ore to be treated is low grade, and the mill will be started early in April. A 100-hp. boiler and 8-drill air compressor were also installed.

Nome

On the southern end of the claim at No. 3 Holyoke creek, Nylander and partners have opened 'pay' from 4 to 5 ft. thick and 35 to 40 ft. wide, averaging 3 to 4c. per pan. This 'strike' is considered of importance, and a continuous run of 700 ft. is expected. It is 40 ft. below the surface and 20 to 30 ft. above bedrock.

The 100-mile dog-team race from Solomon to Council, one of the features of winter life in this district, was run in 12 hours, 41 minutes.

Valdez

Congress at Washington has voted $50,000 for the construction of a dike at Valdez as a protection against the waters of the glacial stream which has always been a menace to life and property of the town.

ARIZONA

Cochise County

No. 1 cross-cut on the 300-ft. level of the Shattuck-Arizona mine is in 11 ft. in ore averaging 29% lead, 11% copper, 30 oz. silver, and 60c. gold per ton. The total length is 29 ft., all in high-grade ore. On the 400-ft. level, No. 21 and 22 cross-cuts are in high-grade copper and lead ore, respectively. No. 24 has opened copper ore, while on the 500 and 600-ft. levels good copper and lead-copper ores are being opened, respectively.

The Calumet & Arizona smelter produced 4,050,000 lb. of copper in February, as against 4,780,000 lb. in January. The Shattuck produced 1,136,080 lb. copper, 109 oz. gold, and 13,323 oz. silver. The Copper Queen company continues its churn-drilling and sinking the Wade Hampton shaft, which is in new country. The lighting voltage at the works has been changed from 220 to 110 volts. During 1912 the Superior & Pittsburg produced 36,118,399 lb. copper, 361,227 oz. silver, and 13,815 oz. gold, valued at $9,131,967. Dividends amounted to $1,919,734. An average of 485 men was employed.

Pinal County

The old Silver King mine, 3 miles from Superior, is reported as again being bonded for $75,000. The property has been idle for many years and is credited with a production of $15,000,000. The Copper Butte mine, near Cochrane and Ray, will probably be worked again. An incline shaft has been sunk 400 ft. Minnesota people are interested.

Yuma County

The French company at Swansea has shut down its mine and smelter, as it has been losing about $20,000 per month. It is said that there are two rival factions in connection with the company's stock, and also that more Frenchmen have started from Paris and the works may soon be operated again.

CALIFORNIA

The February oil production of the state totaled 6,789,000 gal. from 5862 wells, shipments amounting to 6,517,000 bbl. Stocks on hand at the end of the month were 47,968,490 bbl., of which the Kern river field held 30,045,998 bbl. In cementing off the water in the well of the K. T. & O. company in the Coalinga field, 18 tons of cement was used, and the work was successful.

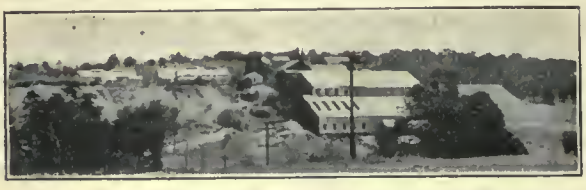
Nevada County

The gold production from quartz mines at Grass Valley is estimated to be about $89,680,000. The Golden Center of Grass Valley Mining Co. has been incorporated with a capital of $300,000 by C. A. Brockington and others, and has acquired from the Berriman estate the old Dromedary property, situated in the centre of Grass Valley. This mine has been shut down since 1871 on account of litigation, but the new company has 40 acres of continuous country under the town, containing the Dromedary, Hill, Ledge, Whiskey, and Church Hill veins. The Dromedary shaft, which is 300 ft. deep, is to be equipped and pumped

out, then the four veins mentioned are to be developed and a mill erected if warranted.

SAN JOAQUIN COUNTY

A compromise was filed at Stockton on March 22 in an injunction suit involving thousand acres of land in San Joaquin, Sacramento, and Amador counties, recently filed against eight large mines by the Valley Farm & Stock Co. and 26 other land-owners. By the terms of the agreement the Kennedy Mining Co., the Zeila company,



SOUTH EUREKA MINE AND MILL.

the Argonaut company, the South Eureka company, the Central Eureka company, the Original Amador company, the Bunker Hill Consolidated, and the Fremont Consolidated are to be exempt from litigation until December 1914. If by that time certain steps are taken to protect the plaintiffs' property, exemption is promised forever. It is the charge of the land-owners that the mining companies have allowed tailing and other débris to accumulate in Dry creek to such an extent that the stream has frequently overflowed and inundated the surrounding territory. Several of the companies have already taken steps to impound and stack their tailing.

TUOLUMNE COUNTY

(Special Correspondence.)—The recent find of gold-bearing gravel at the Leap Year mine, on Table mountain, southwest of Jamestown, was made in a raise started lately 50 ft. from the face of the 1000-ft. adit. It is confidently believed by the Nautilus Gold Mining Co., which is operating the property under bond from Joseph Hopkins, the owner, that the ancient river channel so long searched for has been found. The find of auriferous gravel in the Leap Year claim has greatly encouraged the operators of the Punch Bowl mine, who have been driving from the opposite side of the mountain in search of the old channel. Another contract has just been let for driving the adit at the McCormick mine, near Jacksonville, an additional 100 ft. The adit, which will expose at depth the rich shoots from which former operators took out much gold, will be 1150 ft. long, when the contract just awarded is completed. The property consists of several claims and is being developed by Andrew McCormick and others. The Jamestown Exploration Co., recently incorporated, will shortly begin development at the Carlin mine, situated near Jamestown. Machinery is being installed at the Stanislaus gravel mine for operating with electric power. The adit at the Sonora mine, near Stevens' Bar bridge, has entered into a body of fine ore, gold being visible to the naked eye in much of the rock broken.

Sonora, March 15.

(Special Correspondence.)—R. J. McCann has 12 men employed at the Longfellow mine, at Big Oak flat, and rapid progress is being made in the work preparatory to the complete resumption of operations. It is the intention to sink the shaft to a much greater depth, simultaneously extending the east and west drifts at the 800-ft. or present bottom level. The ore-bins are being filled and the mill put in working order, and the ditch and flumes that convey water to the property are being repaired. The old Chilano mine, situated between Sonora and Jamestown, which has yielded $150,000 to date, is being reopened by John Ryan and associates. A steam-hoist is being installed, and the present force of five men will soon be increased. The Santa Ysabel mine, situated between Quartz and Stent, was examined this week for prospective purchasers.

Sonora, March 22.

COLORADO

BOULDER COUNTY

The coalfields in this county have been disturbed by labor troubles since April 1, 1910. The American Fuel Co., which has 8 mines, has been favorable to the unions, and when in January 1912 the company was in financial difficulties the miners agreed for a while to work two weeks out of four without pay. On March 15, 1913, the company was to have paid all back wages, amounting to $20,000, but failed to do so, and the United Mine Workers of America called out 1000 men from the mines. The Rocky Mountain Fuel Co. has been employing non-union men since the strike was called, April 1, 1910.

CLEAR CREEK COUNTY

About 50 men are employed at the Capital mine, and the company's mill is concentrating 130 tons of ore per day. The old Williams & Tong lease, being operated by the company, shows 16 in. of ore worth $35 per ton in gold, lead, and copper. The Pike Leasing Co., operating below the adit-level, has made a shipment of good ore. Hummer & Son, in a block west of the main adit, have opened 2 to 7 in. of ore assaying 3.66 oz. gold, 13.75 oz. silver, and 29% lead. Their regular mill ore returns $9.50 per ton. The Capital company has a number of men on the 300-ft. level mining ore.

GILPIN COUNTY

Lessees at the Alps mine, on Quartz hill, have opened good ore on the 800-ft. level, and are sinking a winze 50 ft. One shipment of 2.3 tons returned 8.10 oz. gold, 14.60 oz. silver, and 7% copper, while 3 tons of second-class ore yielded 2.63 oz. gold and 5.70 oz. silver per ton.

The Golden Flint Mines Co. acquired an old property in the Independence district, in the northern part of the county, in November 1911. Since then the mine has been pumped out, development done, a 2000-ft. tramway constructed, and a 100-ton mill erected at a cost of $83,000. The mine shows three veins from 2 to 11 ft. wide, worth from $135 to $8 per ton in gold. Steam or electric power can be used. The mill consists of Chilean mills, copper plates, concentrators, and cyanide plant. J. H. Elspass, of Denver, is in charge.

LAKE COUNTY (LEADVILLE)

The prosperity of certain metal-mining districts is generally determined by the number of furnaces a local smelter is able to keep in blast, and the Arkansas Valley plant has five blast-furnaces in operation, with plenty of ore in reserve. Interest is still centred in the work being done at the Mt. Champion claims at the head of Half Moon and Lackawanna gulches. The ore-shoot opened is of peculiar shape, and has been the cause of some discussion. A recent shipment of 15 tons of sorted ore netted the company $9670, but the run-of-mine ore is worth from $100 to $130 per ton.

OURAY COUNTY

During February the Mountain Top adit was extended 341 ft., making a total of 969 ft., leaving 1101 ft. to be driven to the vein. A dike 17 ft. wide was driven through, it being good breaking rock, and extra progress was made. The Brown Mountain Smelting Co. has been financed with a capital of $300,000, and the smelter plant at Ouray is being overhauled preparatory to being started before May. A good supply of ore will come from the Wanakah and other mines, and about 35 men will be employed. The smelter is on the Denver & Rio Grande railroad.

SAN MIGUEL COUNTY

The Tomboy mill worked 27 days in February and crushed 10,500 tons of ore, yielding $32,500, and produced 1600 tons of concentrate worth $54,500, the total value being $87,000. Working expenses, not including $850 on aerial tramway, were $47,500, leaving a profit of $39,500. The tramway is in full operation and doing excellent work. After working at reduced capacity, due to a broken piston in the air-compressor, the Ophir mill is again treating 150 tons of ore per day. A hoist at the Smuggler mine had a brake band broken on March 12, but was soon

repaired. The Liberty Bell mine and mill is in full operation, 80 stamps being at work.

TELLER COUNTY (CRIPPLE CREEK)

The annual report of the El Paso Consolidated Gold Mining Co. states that development covered 6039 ft., and gross ore sales amounted to $820,960. Mining cost $186,912; shipping and marketing, $233,022; lessees were paid $129,593, and the total expenses were $610,548. The net profit was $238,757, and four dividends were paid, totaling $122,500. On January 1, 1913, cash on hand amounted to $131,556. On March 31 a dividend of 2½c. per share, equal to $61,250, will be paid, making the total to date $1,658,545.

In connection with the proposed fourth drainage tunnel, it is estimated that from 5000 to 7000 gal. of water per minute, with a head of 700 ft., would be available from the Roosevelt tunnel, giving about 800 hp., which could be partly used in driving the next tunnel.

It is stated that 31 tons of ore from the new shoot in the Vindicator mine was worth $21,000, or $700 per ton. The main shaft of the Commonwealth mine, on Raven hill, may be soon sunk deeper. Four well known Victor men were captured on March 16 at the El Paso mine, heavily armed, and are at present in jail for carrying concealed weapons, but their presence at the mine is supposed to be for high-grading. There are now 27 sets of lessees in the Isabella mine. The 12-in. drum-shaft of the hoist at No. 2 shaft of the Portland broke during the past week.

IDAHO

SHOSHONE COUNTY

The Hecla Mining Co., operating the Hecla mines at Burke, has declared a dividend of $70,000, making the current year's total $110,000, and to date $2,760,000.

IDAHO COUNTY

The Center Star mine has been bonded to Pittsburg people, and D. C. Livingston, of the State University at Moscow, is making an examination. About three years ago New York people took an option and did considerable work, but did not buy the property. The lower adit cuts the vein at 150-ft. depth, and has been driven 400 feet.

OWYHEE COUNTY

Crowds of people are rushing to Homedale, on the Oregon Short Line, which is 8 miles from the new gold-bearing district recently discovered. Assays show the ore to be of high grade, and there are about 1000 men there already.

MONTANA

BROADWATER COUNTY

At the Radersburg district, suitable buildings are being erected at the Keating mine for a 50-ton plant to employ a new process to extract 90% of the gold and silver contents. During the summer the Keating company will enlarge its mill to 300 to 400-ton capacity, to deal with ores from other mines, there being large quantities of ore worth from $5 to $12 per ton in gold. It is expected that within 6 months there will be 600 men employed by Radersburg mines.

SILVERBOW COUNTY

(Special Correspondence.)—The new concentrator of the Boston & Corbin company at Corbin has been put into commission, and is now treating 250 tons of ore per day. The construction of the mill was commenced last fall, and work on the buildings and the installing of machinery was carried along throughout the winter. The mill is giving every satisfaction, and the first shipment of concentrate has been made to the Washoe smelter at Anaconda. The completion of this mill, and its successful operation, has created more interest in mining affairs, and several properties are making preparations to start work, among them being the Blackjack, Hidden Treasure, Corbin-Pennsylvania, and the Butte Consolidated.

The High Ore mine, of the Anaconda company, which is now down to a depth of 2800 ft., is going to be extended another 500 ft. The High Ore, which is now one of the deepest mines in the district, is also one of the best, and the idea in carrying the shaft down another 500 ft. now is to conclusively prove that at depth the property is even richer than on the upper levels.

Butte, March 24.

The East Butte Copper Mining Co. will add to the equipment of its plant a 150-hp. motor and control apparatus recently ordered from the General Electric Company.

NEVADA

EUREKA COUNTY

The Buckhorn Mines Co. has been developing its property for 2½ years, and has a large tonnage of low-grade ore opened. The 1800-ft. tunnel which is being driven to connect the lower levels with the mill ore-bins, is nearly completed. An electric power-plant will be erected at Beowawe, 18 miles from the mine, on the Southern Pacific railroad. Work on the new mill is in full swing.

HUMBOLDT COUNTY

At Rochester, J. A. Causten and others declined to make a payment on their option on the 'Big Lease' on Lincoln hill, as the rich shoot 'pinched' out. Soon after, it is stated, the owners opened more rich ore, and Rochester people are looking happier. On March 19, J. Nenzel bought out George Wingfield's entire holding in the Weaver claims for $65,000; $10,000 having been already paid. At the Big Four lease of Crown Point No. 1, 300 sacks of ore is being shipped per day. At a depth of 117 ft. in the Codd lease on the main Nenzel vein, at the head of Rochester canyon, 12 ft. of ore has been opened, assaying $35 to $69 per ton. J. P. George, S. Stevens, and P. C. Stevens allege that they were partners of J. Nenzel in all of his claims and holdings at Rochester, and have brought suit against him, the Rochester Mines Co., and the Crown Point Mining Co., to recover half of the 500,000 shares owned by Nenzel in the former company, and a half in the latter company, and the El Finato claim.

LYON COUNTY

During the week ended March 20 the Mason Valley smelter received 2243 tons of ore from the Mason Valley mine, 1894 tons from Nevada-Douglas, and 631 tons from other properties. Ten carloads of matte were shipped.

NYE COUNTY

During February, 9 mines at Tonopah produced 43,881 tons of ore worth $886,400. The yield during the week ended March 22 was 11,910 tons, worth $251,970. At the

MILL OF MANHATTAN ORE MILLING COMPANY.

West End the north cross-cut on the 800-ft. level opened a low-grade quartz vein. In No. 7 level of the Jim Butler the south cross-cut passed through 8 ft. of ore assaying

from $30 to $50 per ton. Driving east and west on the shoot shows good ore. Earnings of the Tonopah & Goldfield railroad for the seven months ended January 31 were $422,520, of which $108,528 is net profit.

At Manhattan, at 150-ft. depth in the Kendall-Douglas lease of the Manhattan Consolidated, a winze has opened 5 ft. of ore which assays up to $2492 per ton. The Big Four mill is now treating 100 tons per day.

STOREY COUNTY

During February the Ophir cyanide plant treated 2400 tons of tailing yielding $3949 in gold and $6502 in silver, with 89.84 and 74.45% extraction, respectively. The cost of transportation was 32c. and treatment $1.52 per ton, and profit $6022.

NEW MEXICO

GRANT COUNTY

From the Pinos Altos mine, G. Utter has shipped a carload of ore assaying 40% iron, 20 oz. silver, and $10 in gold per ton to El Paso. He has about 2500 tons of ore of a similar character. Two opal claims have been staked 9 miles east of Silver City.

OREGON

JACKSON COUNTY

(Special Correspondence.)—S. S. Bullis, of New York, who recently bought the famous old Sterling hydraulic mine, near Jacksonville, is making preparations to develop and equip the property for much larger operations. Several carloads of pipe and machinery have arrived at Jacksonville, and the improvements will be made during the summer at the close of the operating season. Two giants have been working steadily through the winter. The old 'diggings,' which have produced from $25,000 to $60,000 per year for the past 30 years, are now nearly worked out. There is a quantity of higher ground, equally as rich as the old, but it cannot be worked by the present water system on account of being above the gravity head of the giants. In order to reach it, a new high-line ditch will be dug having a length of 35 miles. The present ditch of the Sterling is 25 miles long, and the water-supply one of the best on any southern Oregon placer. The same source of supply will be utilized for the new ditch. This work at the Sterling is in keeping with similar work that has lately been done upon other large hydraulic mines in southern Oregon, many of these, because of continued operation, covering a period of from 25 to 50 years, being short of available ground. Most of them have rich bench diggings, to reach which higher ditches must be constructed and new equipment installed. This has been done on the Columbia on Grave creek; the Steam Beer and Blalock, near Leland; the Wimer, of Waldo; the Logan & Simmons, of the Illinois; as well as many other smaller properties in Josephine and Jackson counties. These important changes will bring southern Oregon back to its former record of gold production and establish the placer-mining business on a new and more substantial basis.

Grants Pass, March 22.

UTAH

JUAB COUNTY

Water has been encountered in a winze below the 2300-ft. level of the Grand Central mine. The winze is 80 ft. deep and has been sunk in low-grade ore, and sinking has been stopped. The lower levels of this mine are producing most of the ore shipped. At the Opohongo a shoot was cut on the 750-ft. level. Below the 700-ft. level a great deal of work has been done from the winze, from which a drift has been driven on ore for 200 ft. Lessees at the East Tintic Development property are shipping from 100 to 150 tons of zinc ore per month. Ore shipments from the Tintic district during the week ended March 21 totaled 181 cars.

SALT LAKE COUNTY

On December 31, 1912, the Ohio Copper Mining Co. had $281,208 in cash and accounts receivable amounting to $273,127. Profits from August 1, when the company was reorganized, to the end of 1912, were $105,000, and the net income was $57,000. During the five months production was 2,343,439 lb. copper, 11,920 oz. silver, and 380 oz. gold.

WASHINGTON

FERRY COUNTY

(Special Correspondence.)—C. C. Reed, supervisor of the Colville National Forest, has received application from the J. L. Harper Consolidated mines, at Republic, for a contract to purchase 200,000,000 ft. of timber on O'Brien creek, and San Poil and Granite creek water-sheds. The timber desired is mostly Douglas fir and western larch, on about 160,000 acres of land on the mountains and river bottoms in Ferry county, within a radius of 12 miles of Republic, extending from 2 to 12 miles southward, 6 miles northward, about 8 miles westward, and 12 miles eastward from Republic. In case the desired contract is secured, the Harper Consolidated mines will begin extensive operations by next June. The cutting of the timber alone would require a large force. The cost of the timber, it is estimated, would average about $1 per 1000 ft. Assuming that a sawmill with a capacity of 150,000 ft. per day was installed, it would require about 3.75 years to cut the timber into lumber. The largest timber operation heretofore recorded on the Colville forest was the purchase by the Orr-Leeper company, last fall, of 700,000 ft. of western red cedar at Boyds, on the east side of the Sherman range, west of the Columbia river, to be used for poles and piles. The request of the Harper Consolidated mines would take about all of the natural timber now standing on the water-sheds of the three creeks, or about 1/30 of the total mature timber upon the Colville forest, which is estimated at about 6,000,000,000 feet.

Spokane, February 19.

A meeting of the North Washington Power & Reduction Co. and the Republic Mines Corporation was held at Spokane on March 11, and plans were formulated for the merging of the two companies, to operate on a large scale in the Republic district.

The North Star Mining Co., which is developing an extension of the First Thought mine in the Orient district, will resume work on April 1 and do considerable diamond-drilling. The property is equipped with a 30-hp. gasoline engine, air-compressor, and hoist. An adit is in 600 ft., giving 100-ft. depth, and a shaft has been sunk from the surface to 100 ft. below the adit. A winze and cross-cut have opened ore containing gold worth $4 to $21 per ton.

CANADA

BRITISH COLUMBIA

Ore production in the Kootenay and Boundary districts during the week ended March 15 was 51,275 tons, making a total for the year of 516,324 tons. The Mother Lode mine of the British Columbia Copper Co. shipped 7613 tons to the smelter at Greenwood, which dealt with 14,550 tons of ore during the week. The Surprise, Hamilton, and Ben Hur mines at Republic, Washington, are shipping to Trail, while the United Copper at Chewelah has sent 1116 tons to that smelter during the current year. The mines of the Consolidated Mining & Smelting Company of Canada have produced 223,787 tons of ore from July 1, 1912, to March 7, 1913. W. Baelz, connected with the Vancouver Nanaimo Coal Mining Co., states that a plant capable of shipping 1400 tons of coal per day is to be constructed at the Issaquah mine, the present plant having a capacity of 400 tons per day. The Granby smelter treated 48,894 tons of ore during the first two weeks of March and shipped 868,000 lb. of copper.

During January the adit of the Portland Canal Tunnels, Ltd., was driven 209 ft., making a total of 392 ft. An average of over 200 ft. per month is expected, the size being 7.5 by 8 ft. For ventilation, 400 ft. of 10-in. pipe has arrived at the property. Twenty men are employed, and it will be late next fall before the adit will cut the Glacier creek orebody. Prospecting is under way at the Seven Mile. Pearson & Peterson, Red Reef, Cascade Falls, and Indian Mines claims. The Lucky Jim Mining Co. will erect a mill to treat its lower grade ore. About $250,000 worth

of ore has been opened above No. 5 level, and 400 tons of ore is ready for the smelter. The mine is equipped with an air-compressor and lighting plant.

ONTARIO

(Special Correspondence.)—The Schumacher company has two diamond-drills operating on its property near Pearl Lake; the McEnaney company is prospecting its ground from the 400-ft. level by diamond-drilling; and the Moneta has resumed operation by diamond-drilling on its southern claim, presumably to cut the extension of the McEnaney veins. The Kirkland Lake section, north of Swastika, is busy, being the scene of a small boom. A deal involving $100,000 has just been concluded for the Wishman claims to a group of Toronto capitalists, David Fasken and associates, while other deals are under way. It is reported on good authority that the Wettiaufer interests have an option on the Tommy James claims, in southeastern Shaw, which they are at present diamond-drilling.

Timmins, March 20.

Thirteen Cobalt mines shipped 485 tons of ore, and five sent out 252,180 oz. of bullion, during the week ended March 15, making the respective totals for the year 3606

COBALT.

tons and 1,727,810 oz. During February, La Rose company produced 230,102 oz., worth $136,182. Expenses amounted to $57,409, and the cash on hand and ore shipments total $1,687,885. On March 20, La Rose, Nipissing, and Timiskaming companies paid dividends totaling $662,000. On the 575-ft. level of the latter mine, a vein 2 to 8 in. wide, averaging 2500 oz. per ton, has been opened for 70 ft. At the Lucky Cross, Swastika, the east crosscut has intersected 18 in. of gold-bearing ore. About 100 ft. of work has been done on the 200-ft. level. At the mill the stamps, concentrators, and copper plates are in position, while the 5 by 9-in. rock-crusher is being installed. The engine and Hardinge mill have not arrived at the mine.

YUKON

The Yukon Gold Co. is satisfied that dredge No. 1, which was blown up on February 14, as mentioned in these columns on March 8, was dynamited, and is offering a reward of $5000 for information. Now that warmer weather is coming on, preparations are being made for a busy season. For the year ended March 31, 1912, the revenue from the Yukon Territory was $563,731, and expenditure $1,112,717. The Boyle Concessions, Ltd., has taken over the entire holdings of the Northern Light, Power & Coal Co. and all subsidiary companies, including the Dawson Electric Light & Power Co., the Dawson City Water & Power Co., and the Yukon Telephone Syndicate, Ltd. The capital stock of the Northern Light & Power Co. is $3,000,000, and the properties include the coal mines, the fine steam power-plant at Coal creek, the railway from Coal creek to the mine, the transmission line of 35 miles over the hills to Dawson, the steamer *Lightning*, and other assets. The capital stock of the Dawson Electric Light & Power Co. is $150,000, the water company $50,000, and the telephone company, $65,000; making a total for the four companies of $3,265,000.

A message has been received from Atlin saying that J. E. Owens had reached there with several hundred dollars' worth of placer gold he had taken from the new 'camp' in the Teslin district, mentioned in the editorial pages last week. This is the first authentic information concerning the new district.

MEXICO

A preliminary report of the Batopilas Mining Co. states that the production during 1912 was ₱702,000. Mining, milling, and general expenses were ₱516,951, while the estimated profit was ₱162,404. The smelter at Chihuahua is treating nearly 1000 tons of ore per day. A census taken of the smelter 'camp' recently showed that over 2500 people are sustained by this industry.

HIDALGO

At the Santa Gertrudis mine a new head-frame, conveyor bridge, and steel ore-bin are being constructed. During December the Real del Monte mine produced 41,000 tons of ore. At the San Jose shaft of La Blanca mine the hoisting rope broke and a large number of men were killed and wounded.

SONORA

Exports from this state through the port of Agua Prieta during February were valued at ₱2,173,100, made up of 13,606 tons of mineral and 8085 lb. of silver bullion from El Tigre. Copper exports were worth ₱1,389,600; gold, ₱285,800; and silver, ₱497,700. The Cananea smelter produced 8,000,000 lb. of copper during the month. The smelter building is being remodeled, and the roof lifted 15 ft., which is expected to correct the smoke trouble. No. 4 Great Falls type of converter has been installed.

The property of the Cerro de Plata Mining Co., situated 35 miles south of Nogales, Arizona, has been examined by A. T. Bird, and a full report published in the *Oasis* of March 15. The district is one of slate and porphyry, with intrusions of rhyolite and granites, in the immediate vicinity of the country is a brecciated andesite cut by dikes of trachyte and quartz. About 2000 ft. from the mine a canyon has cut a wide lode which carries from 6 to 26 oz. silver per ton, and in places a high percentage of copper. The mine has been opened and shipments of rich silver ore sent to El Paso totaled 1400 tons, averaging 117 oz. per ton. Development has opened 57,660 tons of ore, which should yield 46.5 oz. per ton. In November 1912 a 5-stamp mill and cyanide plant was completed and is treating 25 tons per day, with 85% extraction. The total ore treated to February 4, 1913, was 1725 tons, yielding 52,571 oz., while the residue contains 27,641 oz. of silver. A mill of larger capacity is to be erected.

The Tigre Mining Co. at El Tigre treated 5016 tons of ore during February, also 4813 tons of current and 1617 tons of dump tailing, the total yield being $113,576. Costs, including marketing concentrate and taxes, amounted to $65,931, leaving a profit of $47,645.

State troops attacked Cananea early in the morning of March 24, from two directions, with artillery and hand grenades. The federal garrison of 350 men withstood the first assault. The concentrating and smelting plants of the Cananea Consolidated Copper Co. are shut down, and about 2000 employees are expected to help the state troops.

NICARAGUA

(Special Correspondence.)—The adit at the Escandola mine of F. Pelias & Co., near Santo Domingo, is nearing the vein where rich ore was left several years ago on account of trouble with water. Several small veins have already been cut.

Santo Domingo, January 25.

WESTERN AUSTRALIA

(Special Correspondence.)—It is reported that the Moore Filter Co., of the United States, is about to proceed against all users of vacuum-filters. There will probably be a big fight, as the various mining companies have subscribed $120,000 for a defense fund.

Kalgoorlie, January 29.

Market Reports

LOCAL METAL PRICES

San Francisco, March 27.

Antimony	12—12¾c	Quicksliver (flask)	40
Electrolytic Copper	15¾—16c	Tin	52—53¼c

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

ROBERT LINTON is in Pittsburg.

E. H. BENJAMIN is in New York.

C. C. BROADWATER is in New York.

J. W. HUTCHINSON is in New York.

JOHN B. FARISH is at the St. Francis.

J. B. HARRELL is at Melrose, Montana.

HOWARD D. SMITH has gone to London.

C. H. MACNUTT has returned to London.

SAMUEL COLT has gone to Dolomi, Alaska.

HEATH STEELE is at Bonne Terre, Missouri.

CHARLES S. HALEY has returned from Peru.

H. F. WIDDICOMBE is now at Salt Lake City.

C. T. DURELL will be in Denver, Colorado, soon.

G. W. METCALFE was in San Francisco last Saturday.

W. H. LANDERS has gone to the New Almaden mine.

E. T. DUMBLE was in San Francisco during the week.

H. REIS is now with the Eagle Oil Co., at Tampico, Mexico.

J. A. HOLMES is expected on the Pacific Coast the last of April.

E. RAMMELMEYER has returned to Salt Lake from a trip to Europe.

THOMAS T. READ will leave San Francisco this week for New York.

DOUGLAS WATERMAN was married to Miss MARY PAGE DUTTON, March 22.

D. P. BOOTHE is superintendent for the Tonopah Victor Mining Company.

SEELEY MUDD, son of SEELEY W. MUDD, was married recently in New York.

E. E. CARPENTER has left Tonopah to take charge of the Nevada Wonder mill.

R. B. MARTIN will sail from San Francisco for Manila on the *Siberia*, March 29.

B. A. EARDLEY, of the Princeton M. & M. Co., Ketchikan, Alaska, was in Seattle recently.

A. W. ROSS, of London, has gone to Naraguta tin mines, Bauchi province, N. Nigeria, Africa.

C. G. OSGOOD has been appointed mill superintendent for the Montana-Tonopah Mining Company.

W. B. FISHER is now general manager for the Michigan Utah Con. Co. operating in Little Cottonwood canyon, Utah.

FRANK H. PROBERT is making a geological investigation of the Boston-Corbin Copper Co.'s property at Corbin, Montana.

DONALD F. FOSTER, of the Prestea Block A company, Prestea, West Africa, is at Belmont, Sutton, Surrey, England.

R. E. WILLIAMS, who has been assistant general manager for the Waihi Gold Mining Co. for several years, is retiring. He has been engaged in mining for forty years.

J. L. DOBBINS, formerly engineer for the Nevada Consolidated Copper Co., has returned to San Francisco from China, and is now with Haviland, Dozier & Tibbets.

GEORGE T. COFFEY, who has been in San Francisco for several months, leaves for Dawson City this week to superinteud the hydraulic operations for the Yukon Gold Company.

H. P. BARRY, general manager for the Waihi Gold Mining Co., New Zealand, is retiring after 21 years' active work, during which time the mine produced bullion worth $48,000,000.

SIR RICHARD MCBRIDE, Premier of British Columbia, who is also Minister of Mines for the province, gave the Charter Day address at the University of California this week and was given the degree of D.C.L.

James Lewis & Son's Copper Report

The rapid decline in the value of standard copper which took place during January continued during February until £63 2s. 6d. was accepted for cash on February 18, a fall of £14 2s. 6d. since the beginning of the year. There was a recovery to £64 17s. 6d. on the 20th, but under the influence of weak American advices prices declined again to £63 15s. on the 25th, recovering, however, on general 'bear' covering and a better demand from consumers to £65 on the 28th. On March 3 the buying had continued, and with a strong market there has been a further advance to £66 7s. 6d., this being the closing value for both cash and three months.

The losses due to the serious fall in the price of copper since the beginning of this year have mainly fallen upon American producers and refineries who withheld their copper from the market and refused to sell at prices which European consumers were willing to pay, and have now to accept the equivalent of £68 10s. to £69 per ton c.i.f. for wire bars. The extent to which the stocks held by the English and French manufacturers have been denuded is shown by the small quantities of copper taken for consumption from the arrivals and from the public stocks, as given in our last report. Nine hundred tons of American wire bars and ingot bars have been put into warehouse at Liverpool, and large quantities on the Continent during the past month, presumably on account of the producers.

Exports from the United States during February were advised as 26,767 tons. European stocks have increased 1947 tons, and the visible supply 1572 tons during the month. Imports are 8940 and deliveries 9128 tons less than during the same period last year. Total arrivals in England and France for February were 16,034 and deliveries 17,711 tons fine. Arrivals in England from Chile were 2012 and deliveries 2308 tons fine, and from other countries 9834 and 11,021 tons, respectively. Arrivals at Liverpool and Swansea from the United States were 2025 tons of bars and 1185 tons of ingots, equal to about 3204 tons fine copper; in London, 502; and in France 3808 tons fine. Chile charters are advised as 2600 tons, including 1200 tons for the United States. Chile exports for the past year were 37,850 tons fine, and chartered to February 28 were 7400 tons fine.

Total non-metallic.....	.....	$ 71,949,500
Grand total	.....	$133,127,489

This is an increase of $29,906,495 on the previous year.

The percentage of yield from the various provinces was as below:

	Value of production.	Per cent of total.
Nova Scotia	$ 18,843,324	14.15
New Brunswick	806,584	0.61
Quebec	11,675,682	8.77
Ontario	51,023,134	38.33
Manitoba	2,314,922	1.74
Saskatchewan	909,934	0.68
Alberta	12,110,960	9.10
British Columbia	29,555,323	22.20
North West Territories	5,887,626	4.42
Total Dominion	$133,127,489	100.00

The detailed mineral production of Ontario in 1912 was valued at $47,471,990, the most important products being as follows:

	Quantity.	Value.
Metallic:		
Gold, ounces	89,080	$ 1,859,285
Silver, ounces	30,322,805	17,455,080
Copper, tons	11,116	1,581,062
Nickel, tons	22,421	4,722,040
Iron ore, tons	117,357	238,884
Pig iron, tons	589,593	8,054,369
Lead (concentrate), tons.....	26	1,290
Cobalt oxides, pounds	1,029,532	317,165
Nickel oxides	117,160	11,716
		$34,240,891
Less Ontario ore smelted into pig iron, 71,589 tons		145,326
		$34,095,565

Non-metallic:		
Arsenic, refined, pounds	3,927,347	$ 79,297
Brick, common and pressed	445,028,000	3,805,919
Building and crushed stone	.....	953,839
Calcium carbide, tons	1,998	120,000
Cement, barrels	3,028,486	3,373,653
Corundum, tons	1,960	233,212
Feldspar, tons	12,133	24,416
Graphite, refined, tons	1,246	65,076
Gypsum, tons	31,331	50,246
Lime, bushels	2,297,525	381,672
Mica, tons	318	36,634
Natural gas	.....	2,267,897
Petroleum, imperial gallons	8,432,730	344,537
Salt, tons	90,986	450,251
Talc, tons	5,902	53,118

The total non-metallic production was worth $13,376,425.

Mining and smelting nickel-copper ores in the Sudbury district of Ontario was carried on with an increased output during 1912. Prices ranged from 40 to 55c. per pound, electrolytic being 5c. higher. Details of the industry are as follows:

Ore mined, tons of 2000 lb	737,584
Ore smelted, tons of 2000 lb	725,065
Bessemer matte produced, tons of 2000 lb	41,925
Copper content of matte, tons of 2000 lb	11,116
Nickel content of matte, tons of 2000 lb	22,421
Value of matte	$6,303,102
Export of matte to Great Britain, tons of 2000 lb	2,536
Export of matte to United States, tons of 2000 lb	19,574

Preliminary estimates of the yield of Quebec, as made by the Department of Mines, show a total value of $11,017,046, as against $9,679,786 in 1911. The principal minerals produced were as follows:

	Quantity.	Value.
Asbestos, tons	111,175	$3,059,084
Bricks	100,146,100	1,284,232
Cement, barrels	2,684,002	3,098,350
Copper and sulphur ores, tons	62,107	631,963
Gold, ounces	980	19,924
Granite	.....	358,749
Graphite, pounds	1,210,278	50,680
Lime, bushels	1,705,937	455,570
Limestone	.....	1,361,082
Marble	.....	250,939
Mica	.....	99,463
Ochre, tons	7,054	32,010
Peat, tons	500	2,000
Sand, tons	81,800	33,200
Silver, ounces	26,526	14,591

Chilean Mineral Production

The total mineral production of Chile from 1810 to 1910, according to a *Daily Consular Report*, has amounted to nearly two and a half billion dollars in value, as below:

Minerals.	Quantity.	Value.
Gold, grams	103,057,323	$ 68,084,544
Silver, grams	8,794,136,000	298,695,000
Copper, metric tons	2,169,586	664,292,019
Manganese, metric tons	565,308	4,767,308
Iron, metric tons	154,321	594,968
Lead, metric tons	12,302	542,850
Cobalt, metric tons	6,388	423,663
Coal, metric tons	27,700,748	114,516,524
Nitrate, metric tons	35,596,571	1,235,311,994
Iodine, metric tons	9,557	48,780,332
Borate, metric tons	331,428	15,961,812
Salt, metric tons	2,350	3,371,548
Guano, metric tons	257,274	5,501,637
Sulphur, metric tons	45,163	1,977,810
All other	.....	688,233
Total	.....	$2,463,510,242

Company Reports

GOLDFIELD CONSOLIDATED MINES COMPANY

The report of this well known company covers 14 months from November 1, 1911, to December 31, 1912, made necessary by a change in the company's fiscal year conforming to that of the calendar year. The report of the president, George Wingfield, states that, during the period under review, ore production was 415,786 tons, averaging $19.77 per ton, a total of $8,220,238, and deducting metallurgical losses and cost of ore purchased, the net yield was $7,652,046, or $18.40 per ton. Gross expenses totaled $2,765,046, leaving net realizations of $4,886,399. Costs were reduced by $1.36 per ton, the chief items being milling, 28c. per ton; marketing concentrate, 61c.; marketing bullion, 8c.; and general expense, 10c. per ton. Two dividends of 50c. per share each, and two of 30c. each, or $1.60 per share, were distributed, aggregating $5,694.637. While they exceeded the net profits for the term, excess realizations of previous years made them possible. The year closed with a cash balance of $728,823, with bullion and other settlements outstanding of $214,774. The additional milling plant, costing $79,000, was in operation in February 1912, and resulted in an increase of 50c. per ton profit through the elimination of marketing concentrate. Plant depreciation was written off, amounting to $140,790. Development work covered 48,146 feet.

The report of the general superintendent, J. F. Thorn, who has since resigned, summarizes the 14 months' work as follows:

The production of milling and shipping ore, according to each section of the mine, was as follows, minor fractions being here disregarded:

Shaft.	Tons.	Average.	Value.
Combination	70,578	$18.88	$1,332,525
Mohawk	140,147	18.66	2,615,751
Red Top	18,748	22.15	415,225
Laguna	36,591	13.01	476,064
Jumbo (Clermont)	128,618	23.10	2,970,749
Jumbo No. 2	8,678	17.58	152,532
Total	403,360	$19.74	*$7,962,846

	Tons.	Value gold and silver.	Value copper.	Total average.	Total value.
Jumbo	12,241	$254,862	$83,194	$27.62	$338,056
Laguna	185	2,526	570	16.74	3,097
Total	12,426	$257,389	$83,765	$27.45	$341,153

	Total val.	Av. per ton.
403,360 tons milled	$7,962,849	$19.74
12,426 tons shipped	257,389	20.71
415,786 tons total production	$8,220,238	19.77
Loss in tailing	561,218	1.36
Value recovered	$7,656,020	$18.41
Cost of ore purchased	3,974	0.01
Value realized	$7,652,046	$18.40
Expenses:		
*Mining	$1,409,000	$ 3.39
Transportation	34,754	0.08
Milling	670,427	1.61
Concentrate treatment	158,496	0.38
Marketing concentrate, residue, and by-products	53,995	0.13
Marketing bullion	28,137	0.07
Marketing ore shipped	80,320	0.19
General expenses, including legal and administration	188,470	0.45
Bullion tax	53,635	0.13
Income tax	30,354	0.08
Total operating expenses	$2,707,598	$ 6.51
Miscellaneous earnings	29,342	0.07
Net operating expenses	$2,678,251	$ 6.44
Realization from operations	$4,973,795	$11.96
Construction	87,395	0.21
Net realization from operations	$4,886,400	$11.75

*In statement of production and expenses the value of the copper in the ore shipped ($83,765) has not been taken as

production. The amount realized from the copper has been considered as an offset to the expense of marketing the ore. This value amounts to 20c. per ton on all ore mined, and by adding this to production it would make a corresponding addition of 20c. per ton to total costs, making them $6.92 per ton instead of $6.72.

Operating costs are shown in the following table:

Item.	Cost per ton.	Total.	
Mining—415,786 tons:			
Labor	$2.34	$973,925	
Supplies	0.89	371,015	
Power	0.16	64,060	
Total	$3.39		$1,409,000
Transportation—403,360 tons:			
Railroad operation	$0.06	$ 24,452	
Railroad maintenance	0.03	10,302	
Total	0.09		34,754
Milling—403,360 tons:			
Labor	$0.39	$156,219	
Supplies	0.94	379,639	
Power	0.33	134,568	
Total	1.66		670,426
Concentrate treatment:			
Labor	$0.07	30,321	
Supplies	0.27	109,540	
Power	0.05	18,635	
Total	0.39		158,496
Total operating	$5.53		$2,272,679

CONCENTRATE TREATMENT COSTS

Tons treated—24,376.			
Labor	$1.24	$ 30,321	
Supplies	4.50	109,540	
Power	0.76	18,635	
Total	$6.50		$158,496

In the Combination ground, development covered 6236 ft. The principal new orebody was the 136 BX, about 300 ft. northwest of the shaft on No. 2 level, and has produced 8931 tons averaging $34.73 per ton. This lode is 150 ft. long and 40 ft. wide. A new shoot was found in the Reilly vein, 300 ft. southeast of the shaft, between No. 5 and 3 levels, and produced 12,994 tons, worth $23.48 per ton. Development in the Mohawk covered 16,332 ft. The Sheets-Ish vein on the 150-ft. level produced 24,272 tons, worth $20.01 per ton. On the 250-ft. level a new sill in the 111 vein yielded a small tonnage. The 490 shoot, between the 450 and 600-ft. levels, produced 26,682 tons of $39.02 ore. The 202 stope, between the 250 and 350-ft. levels, should yield a large tonnage during the current year. In the Jumbo-Clermont section 14,599 ft. was done, the greater part being confined to the lower levels of the Grizzly Bear, where an important discovery was made on the 1300-ft. level. The shoot was found after passing through a barren zone on the 1200-ft. level, and has produced 1453 tons averaging $32.80 in gold, silver, and copper. The Grizzly Bear shaft has been sunk to the 1400-ft. level, but driving is slow on account of high temperatures, a large flow of water, and limited hoisting capacity. These troubles are being remedied as fast as possible. Little new ore was opened in the Red Top and Laguna properties, although development covered 9541 ft. Ore reserves are estimated as 300,000 tons of good grade, in addition to a large tonnage of low-grade but profitable ore. To enable thorough prospecting of the country below 1400 ft., a diamond-drill of 3000-ft. capacity has been set up.

According to the report of the mill superintendent, J. W. Hutchinson, the concentrate plant, which he described in the *Mining and Scientific Press* of January 25 and February 1, was completed in February 1912. Its operation has cut out the cost of marketing concentrate and increased the net profit from the mill 50c. per ton. During the current year the accumulated concentrate on the dump will be re-treated. The mill is in good condition, and it worked 95.22% of the total time, the stamps averaging 9.44 tons each per day. It will be necessary to renew all the cloths on the vacuum-filter, as they have been in continuous service for four years.

Total production of the property of this company may be stated as follows:

	Tons.	Av. value.	Total value.
Combination mine	317,189	$35.31	$11,198,643
Mohawk mine	515,363	38.56	19,871,036
Red Top mine	226,284	27.78	6,286,071
Jumbo-Clermont mine	370,003	45.08	16,680,597
Total	1,428,839	$37.82	$54,036,347

Of the above production, $11,200,000 was made by lessees, and $2,700,000 by the several companies prior to their acquisition by the Goldfield Consolidated Mines Co., which has a production of about $40,136,000, of which $23,839,067 was paid in dividends. The capital stock is 5,000,000 shares at $10 each, of which 3,559,148 have been issued. The balance-sheet shows the mill, railroad, absorption, mill supplies, concentrate, bullion, and cash on hand to be worth $1,111,219. Undivided profits amount to $641,723.

STANDARD CONSOLIDATED MINING COMPANY

This famous old property is situated at Bodie, Mono county, California, near the Nevada border, and the thirty-fourth annual report gives the following information. Interesting details of the cyanide plant will appear in a future issue of this journal.

During the year ended January 31, 1913, the mine produced 8150 tons of ore averaging $11.72 per ton, and the cyanide plant treated 16,569 tons of talling from the ponds worth $5.63 per ton, the total realization being $188,902. Development in the mine covered 6216 ft., in 35 different sections, at a cost of $6.37 per foot, of $4.86 per ton; and stoping was done on 20 different veins at a cost of $5.86 per ton. An examination of the property was made by T. H. Leggett, and various suggestions have been followed as closely as possible. Because of the nature of the 'stringers' which are being worked, and the old veins which are being reworked, it is not possible to make an estimate of the ore reserves. An effort to interest lessees in the territory not being worked has been partly successful, and so far 8 leases have been issued, five being in operation. Work was discontinued on the Nevada claim, as nothing payable was discovered. The mill worked much below its capacity during the year, being hampered by limited capacity of the cyanide plant and shortage of water for power. The cost of milling was $1.92, and treatment $2.10 per ton, the total recovery being 86.6%. The hydro-electric plant continues intermittent in operation during the winter, on account of shortage of water. A number of repairs were made to water-wheels and generators. The cost of power was $8081, and sale of power amounted to $2747.

The cost of mining is given below:

	1911.		1912.	
Development, labor	$4.304		$3.701	
Supplies	1.077		1,089	
Power	0.038		0.067	
		$5.419		$4.857
Stoping, labor	4.735		4.335	
Supplies	2.478		1.448	
Power	0.042		0.078	
		7.255		5.861
Total		$12.674		$10.718

The net profit for 1912 was $7730. The company holds securities of a total market value of $54,937, and the surplus is $117,175. Production to date is valued at $16,324,895, and dividends total $5,229,809.

CROWN RESERVE

The annual statement of the Crown Reserve of Cobalt showed an output for last year of 2,714,766 oz. of silver of the value of $1,692,060, yielding a profit of $1,136,010. The total production of the mine to the first year was 15,227,143 oz., having a gross value of $8,273,908, and the total dividends paid for five years were $4,775,797. R. W. Leonard, president of the Conlagas, deprecates the attempts which have been made to inflate the stock of the company, and in a recent statement warns investors that while three or four year's supply of ore has been blocked out, the company's operations are not likely to be continued much beyond that time, as the whole property has been pretty thoroughly explored underground.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

OPAL mined in New South Wales in 1911 was valued at $270,000, and the total since 1890 is $6,210,000.

PRODUCTION OF PYRITE in Canada in 1911 was 82,666 short tons valued at $365,820, of which 32,102 tons was exported.

CONCRETE made of a 1-3-6 mixture requires 1 bbl. of cement per yard, and of 1-3-5 mixture, 1.2 bbl. per yard.

MINES of Ontario employed 9500 men during 1912, of whom 32 were killed, which is equivalent to 3.36 per 1000 men employed.

AIR CONSUMED in a blast-furnace, in making one ton of pig iron, amounts to 6 tons, while there are also used 4 tons of ore, coke, and limestone.

FURNACES used for roasting pyrite are the Maletra shelf, MacDougall, Kauffmann, Herkules, Herreshoff, Wedge, Heinze-Freeland, Merton, O'Brien, Sjostedt, and Jones rotary.

ASBESTOS mined in the Ural mountains of Russia is exported in the raw state, but a large plant is to be erected for manufacture of asbestos material, by a new syndicate which controls the output of six companies whose production is about 18,500 short tons.

GRAPHITE exported from Ceylon in 1911 amounted to 30,231 tons, of which the United States imported 12,062, Germany 8572, Great Britain 5794, and Belgium 3108 tons. The industry on that island gives employment to about 50,000 men, women, and children at 770 'pits.'

GAYLEY DRY-BLAST process of smelting iron ore has shown the following results at four plants, based on actual work over a considerable period:

Output, increase, per cent	23.0	15.3	11.8	16.0
Coke used, decrease, per cent	10.5	6.0	9.8	10.5

MODERN BLAST-FURNACES consume about 40,000 cu. ft. of air per minute, and for each grain of moisture per cubic foot, there enters the furnace 1 gal. of water per hour for each 1000 cu. ft., that is, if the moisture was 1 gr. per cubic foot, 40 gal. of water would enter the furnace per hour.

PLATE-GLASS industry of the world produces about 125,000,000 sq. ft. per annum, of which 60,000,000 sq. ft. is made in the United States. There is $49,000,000 invested in the business in this country, employing 11,000 men. The average cost of manufacturing plate glass in 1912 was 23.98c. per square foot.

RUBBER production of the world in 1912 was 104,700 tons, of which Mexico, Central and South America yielded 47,700 tons; Africa, 15,000 tons; and Asia, 12,500 tons. The production of 'plantation' or cultivated rubber was 28,500 tons. In consumption, America used 48,000 tons; Great Britain, 17,250 tons; Germany, 16,000 tons; and France, 10,000 tons.

DUST losses at the Copper Queen smelter from blast-furnaces varied from 0.06 to 0.16% of the smoke, and contained 9% copper, 8% lead, and 5% zinc, and a new dust chamber using wire screens has been erected. Dust from the converters contained half this amount of copper, but twice that of the lead and zinc.

STEAM-SHOVEL work at Panama is full of interest. During January, shovel No. 227, working 26 days in the Empire district, excavated 45,541 cu. yd. of rock; while shovel No. 208, working 26 days in the Culebra district, handled 44,481 cu. yd. of rock. The best work for one day was done by No. 256 in the Culebra district, which excavated 3230 cu. yd. of rock.

GRAPHITE DEPOSITS of Pennsylvania are confined entirely to sedimentary rocks that have undergone a great degree of metamorphism, or to igneous dikes which cut such rocks. In increasing order of importance, the graphite is found in sandstone, gabbro, limonite iron ore, basic gneiss, crystalline limestone, and acid gneiss. So far payable deposits have only been found in the two last mentioned rocks.

SAND is the strongest roof-supporting material that can be flushed into mines. Tests made with flushed Delaware river sand, confined in a cylinder 6⅞ in. diam. and 10⅞ in. high, with pressures varying from 2.5 to 150 tons, showed a compression of from 0.12 to 1.93 in. Though often credited to European miners, the origin of the system of filling mine workings with sand or other material was in the anthracite mines of Pennsylvania.

MICA DEPOSITS in Canada, whether of the amber or white variety, possess a sufficient degree of similarity in the mode of occurrence of the mineral to have called for, in most instances, practically identical methods of development. The greater number of mica mines might more properly be termed quarries. The provoking feature about mica deposits of both varieties, from a miners' point of view, is the lack of continuity of the 'shoots.'

PYRITES suitable for acid making should contain as much sulphur as possible, pure pyrite containing 53.4% sulphur. Many acid manufacturers demand a product containing not less than 42%, although some purchase ore as low as 37%. In general, pyrite should be free from arsenic, but several fertilizer works accept it, if this mineral does not exceed 1%. The presence of copper, zinc, lead, antimony, calcium, magnesium, fluorine, chlorine, and selenium are undesirable.

DIAMOND-BEARING DEPOSITS may be divided into three classes, namely: (1) those in which the diamond occurs as a primary constituent in certain basic igneous rocks, as in South Africa, San Juan de Chapada in Brazil, in the Eastern Townships of Quebec, and the Tulameen district of British Columbia; (2) they are present in intimate association with chromite as a differentiation product of rocks of peridotite facies, in sedimentary deposits, as in certain conglomerates in Brazil; and (3) in alluvial deposits.

ROLLS working at a speed of 700 ft. per minute absorb the following power:

In.	Hp.	In.	Hp.
36 by 16	20	36 by 15	20
40 by 15	25	18 by 10	8
40 by 20	30	24 by 14	11
40 by 30	42	30 by 14	15
40 by 36	50	36 by 10	12
42 by 16	30	36 by 15	20
54 by 24	45	30 by 16	15
26 by 15	12	36 by 16	20

METASOMATISM in sulphide enrichment of certain ore-bodies in Colorado is summarized by E. S. Bastin in *Economic Geology*, by saying that (1) metasomatic replacement is shown to be an important process in downward sulphide enrichment in certain veins; (2) no change in volume is involved in the replacement; (3) the secondary minerals deposited in fractures are identical in character, and often crystallographically continuous with those deposited by metasomatic replacement, and are probably different expressions of the same general process; (4) since the solutions which accomplish the replacement are circulating, and their supply of replacing material is constantly being renewed, the replacement process cannot be metathetical in character, and no constant relationship between the volume of the replaced and replacing minerals is to be expected; and (6) whether or not porosity develops during replacement, appears to depend mainly upon the ratio between the dissolving and depositing tendencies in the solutions.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

PHOSPHATES IN LODE FORM—HOW LOCATED

If a mineral deposit exists in vein or lode formation—that is to say, if it be in place in the general mass of the mountain—it is subject to disposition only under the provisions of the lode mining laws, whether the mineral it bears be metallic or non-metallic in character. A deposit of phosphate rock, confined between well defined boundaries, constitutes a lode or vein of mineral-bearing rock in place within the general mass of the mountain, and hence is subject to disposition only under the provisions of the lode-mining laws.

Harry Lode Mining Claim, 41 Land Decisions, 403. Dec. 12, 1912.

OIL LEASE—RECOVERY FROM SECOND LESSEES

Petroleum in and under the surface, and not reduced to actual possession of any person, constitutes a part of the land and belongs to the owner thereof, who has the right to reduce the mineral to possession or grant the privilege of doing so to other persons. Where the owner of oil lands has wrongfully sought to cancel an outstanding lease and to make a new lease to other parties, the second lease is void, and the owners of the first lease are entitled, upon establishing their rights thereunder, to recover from the second lessees the value of the oil theretofore extracted by them, but not punitive damages if such second lessees were acting within an honest belief as to their legal rights. The recovery therefore is limited to the value of the oil extracted, less the cost of extraction.

Kahle *v.* Crown Oil Co. (Indiana), 100 Northeastern, 681. Jan. 30, 1913.

OIL PLACER—DISCOVERY VALIDATES LOCATION

Where parties located an oil placer in 1899 and sunk a well thereon, the only result of which was to develop an artesian flow of water, although it passed through some oil-sands which it was estimated would yield 40 bbl. per day, such a well, never having produced any oil, could not constitute a discovery which would support the location. The same parties, however, in 1908 went on the claim and drilled a well which produced oil in paying quantities, and this was held to complete their prior location so as to bar adverse parties who had in the meantime posted a location notice on the ground, but had not proceeded with reasonable diligence to make a discovery until after the original locators had completed their discovery well as above stated.

Borgwardt *v.* McKittrick Oil Co. (California Supreme Court), Feb. 11, 1913. (Not yet reported.)

VALID LOCATIONS IN CALIFORNIA

A lode claim, to be valid, must have its boundaries marked so that the limits of the claim may be readily traced. An attempt to locate a number of claims by posting one notice at the point of discovery of one claim would be absolutely futile. A separate discovery must be made on each claim, a notice posted at the point thereof in the usual form, and the boundaries marked as above stated. The general rule in this state is that the corners of each claim must be marked by a post or other substantial monument. An attempted location of an excessive area is void as to the excess over the statutory area, if that excess can be determined from an inspection of the notice. If the excess cannot be determined, the entire location is void. Ground covered by a void location is of course open to location by any qualified person. Assessment work may be performed for the benefit of a group of contiguous claims by driving such a tunnel on one of them as will tend to develop the group. See Daggett *v.* Yreka Mining Co., 149 California, 357, for general ruling as to requisites of valid locations in this state.

Commercial Paragraphs

The HARDINGE CONICAL MILL CO. has opened an office at 563 Salisbury House, London Wall, London, England.

The MERRILL METALLURGICAL CO., San Francisco, has moved its offices to the fifth floor of the Rapp Bdg., 121 Second street.

The DORR CYANIDE MACHINERY CO., of Denver, has ordered a Hardinge pebble mill and Hardinge ball-mill, both sectionalized, for use in connection with installations of their machinery.

The HARDINGE CONICAL MILL CO. reports that the Copper Range Consolidated Mining Co. has increased its order from twenty-three to thirty Hardinge conical mills. Also that an order has just been received for another sectionalized mill from the Olla de Oro Mining Co. of Bolivia, which makes four of this type of mill in that district.

Following a long-established custom, the 600 or more salesmen, as well as the department managers, of the H. W. JOHNS-MANVILLE CO. assembled in annual convention on various dates from January 2 to February 8 at Milwaukee, Boston, New York, Philadelphia, Pittsburgh, Cleveland, Chicago, St. Louis, New Orleans, San Francisco, and Toronto, to learn more about the products which they sell.

The TAYLOR-WHARTON IRON & STEEL CO. announces that H. A. Johann and Martin O'Shaughnessy, who have been in charge of the Chicago and Middle West territory, having resigned effective March 31, to engage in other business, the Chicago office of the Taylor-Wharton Iron & Steel Co. will be in charge of George R. Lyman and J. R. Bolgiano, with Guy H. Bergen, representing the company particularly in the Mesabi Range district.

EDITORIAL

DESPITE disturbed political conditions in Mexico, the American Smelting & Refining Company enjoyed a good year in 1912. The fourteenth annual report of this company, which is received too late for full review this week, shows a gross income of $16,759,499, with a net income of $11,079,676. A pleasant item in the report is the announcement that the pension fund has been increased to $500,000 to provide for superannuated employees.

NOT since the famous 'Row upon the Stanislaus' has there been such a fight as has been precipitated by Mr. Whitman Symmes' report upon the Comstock. "The quarrel is a very pretty quarrel as it stands; we should only spoil it by trying to explain it," but our sympathies are not unnaturally with Mr. Symmes, since it was in this paper that he published in 1908, his first caustic analysis of the conditions that cause the present disrepute of the great lode.

LEAD production figures for 1912 are now available in detail, and are printed on another page. It speaks well for the statistical work of the United States Geological Survey that the final figures only differ by 71 tons from the estimates made for the Survey by Mr. C. E. Siebenthal, January 2, and published in our review number January 4. Evidently Mr. Siebenthal keeps in close touch with the industry and has the confidence of producers. It is regrettable that the latter do not furnish to him figures of stocks. In their absence he can only calculate the amount of lead "available for consumption." It developed this year that the actual consumption differed materially, but in the absence of exact figures, it is idle to speculate.

MINE TAXATION is a topic of lively discussion in Arizona just at present. Last week the Ways and Means Committee of the House and the Finance Committee of the State Senate, held a public hearing at which Messrs. Norman Carmichael, Will L. Clark, N. L. Amster, John W. Bennie, and J. Parke Channing took part. It is a good sign when the lawmakers call in such competent advisers. Mr. Channing, in an interesting address, pointed out differences between mining conditions in Michigan and Arizona which, in his judgment, made it inadvisable to adopt locally the physical valuation system in vogue in the Lake Superior region. To meet conditions in the Southwest, a system was preferred of estimating the value of a mine upon some multiple of the net and some fraction of the gross earnings without any further addition for the reduction works.

APPOINTMENT of Mr. Charles E. Van Barneveld as chief of the department of mines and metallurgy of the Panama-Pacific International Exposition, assures competent and scholarly direction of the work. Mr. Van Barneveld is a graduate of McGill University who after several years practice in Mexico and the Southwest, assumed the chair of mining at the University of Minnesota. It is from the latter position that he comes to California. He has an intimate acquaintance with mining in the West as well as the Middle West and the East, and we bespeak for him the hearty coöperation of mining men everywhere. The directors have been slow to make a seleetion, and there is a strong feeling that, for mining, a Californian might well have been chosen. This, however, will not affect the welcome extended to Mr. Van Barneveld.

Miners and Legislation in California

California mining men, acting through the legislative committee of the California Miner's Association, have presented a thoughtful report upon mining legislation pending at Sacramento. The Association calls especial attention to the needs of the State Mining Bureau and recommends large increases in its appropriation. In particular, the sum of $25,000 is asked in order to enable the Bureau to make a creditable exhibit at the Panama-Pacific Exposition. While, as our readers know, we are not hopeful of consistently good results being accomplished by the Bureau until its present anomalous plan of organization is corrected, there can be no question but that the best State Mineralogist can accomplish nothing without adequate funds. California is already appropriating for the overhead expense but giving no funds for field work. This is a silly and short-sighted policy. It would be better to abolish the Bureau if California is really too poor to support it on an efficient basis.

As to mine inspection, the committee seriously doubts the need of any state inspection service, but, as good citizens should, it offers valuable advice regarding amendments that should be made if the Finnegan bill, which has been recommended favorably to the House, be passed. The committee is on sound ground in urging that a sufficient salary be paid to permit obtaining the services of good men, and in objecting to limitations that would practically restrict the Governor in his selection to appointment of a common workman—one who at the end of seven years underground work in California had been so unsuccessful as to have acquired no interest in any mining property. This is too narrow a view of what constitutes competence. A pertinent amendment also is one regarding the use of liquor underground. No man under the influence of liquor should be allowed in or around a mine at any time, and the only safe rule is never to allow liquor in the mine. Under the California system, especially as it probably will be amended at this session of the legislature, the mine owner is responsible for all accidents. It is certainly proper under these conditions to interpose state authority to protect him against men who take wilful risks, and a miner who 'overestimates his capacity' may at a critical time endanger many.

As to general legislation, the report of the committee is notably conservative. It opposes a large number of bills which propose restraints on the right of contract and further limitations on hours of labor. Blacklisting, picketing, and boycotting are alike condemned, and the proposal to extend the right of eminent domain to mining companies desiring to purchase land for disposal of tailing, is also opposed. Though this would be a convenience and help to the mines, it is so certainly unconstitutional that passage of the bill would but lead to useless litigation. As to the regulation of dredging and smelter fume, discussed in an earlier issue of the *Press*, the committee naturally aligns itself with the general sentiment of mining men who see no reason for imposing additional regulation.

As a whole, the report of the committee is a brief but well-considered presentation of the miners' view of problems that confront the law-makers at Sacramento.

John Pierpont Morgan

In the death of J. P. Morgan the United States loses one of its foremost financial magnates, and the world one of its greatest bankers. Criticism as well as praise fell frequently to his lot. Many saw in him and his control of finances a dangerous portent: but as he himself pointed out when testifying before the Pujo committee, his power, as is that of every other great banker, was based upon public confidence in the man. People trusted money to him because they believed in his honesty and in the soundness of his judgment. The first has never been questioned, and events have justified the second in all but a few instances. Sharp differences of opinion existed frequently as to his policy. It is undeniable that large amounts of water were converted into securities by Morgan transactions; the permanent burden of interest that industry must bear has been greatly increased; but this may well have been in the main but a recognition of facts as they existed, and water may have cost less than prolonged industrial conflict. Morgan was preëminently a reorganizer. It was his specialty to take halting enterprises and put them on their feet, and in this he did much good. A few consolidations went to pieces and some are under fire, but in the main his work has stood. Essentially he was a merchant. He sold securities, and people bought because experience taught that Morgan stocks would pay dividends and Morgan bonds were safe as to interest and principal. Morgan had few relations with mining, though through the United States Steel Corporation, the anthracite railroads, and other enterprises, he came into secondary relations to the industry. Despite hasty generalizations to the contrary, mining is a sound and profitable industry. It is interesting to speculate what might have been the outcome if Morgan, with his insight, industry, reliance on character, and his resources, had devoted his energy to supplying the world with metals and minerals. Raw materials limited in quantity, afford the best natural basis for monopoly, and mining is founded on just those conditions. The Morgan of mining is still to come.

Copper Mines in Chile—II

By Juan Blanquier

The Collahuasi District

This copper mining district is situated in the province of Tarapacá, at latitude 21° S. Its distance from the Pacific coast is 95 miles in an air-line. The altitude is 15,000 ft. above sea-level. It was known and worked superficially by the native Indians before the arrival of the Spaniards; but it is only since 1899 that the district has been known as a producer of copper, due principally to the accidental discovery of an important orebody that yields from the surface abundant ores of an average grade of 40% copper.

There are two transportation routes from the Collahuasi district to the Pacific coast. One to the port of Iquique, the other to the port of Antofagasta. The route from Collahuasi to Iquique has a total length of 186 miles, divided into two parts; the first from the port to an intermediate point in the interior, 3700 ft. above sea-level, is served by a railroad 108 miles long; the second is a wagon-road 78 miles long, starting from the end of this railway line and ending at the mining camp 15,000 ft. above sea-level.

Transportation over the wagon-road is by two-wheeled carts drawn by six mules; the carts carry one long ton when going up to the mines with supplies and 2.5 long tons of ore when coming down. The total freight from Collahuasi to Iquique is $12 per ton. The other route from Collahuasi to the port of Antofagasta is a narrow-gauge railroad line, 300 miles long. This line has been in operation since 1907. The freight on ores to the port of Antofagasta over this line is $6 per long ton.

Geology at Collahuasi

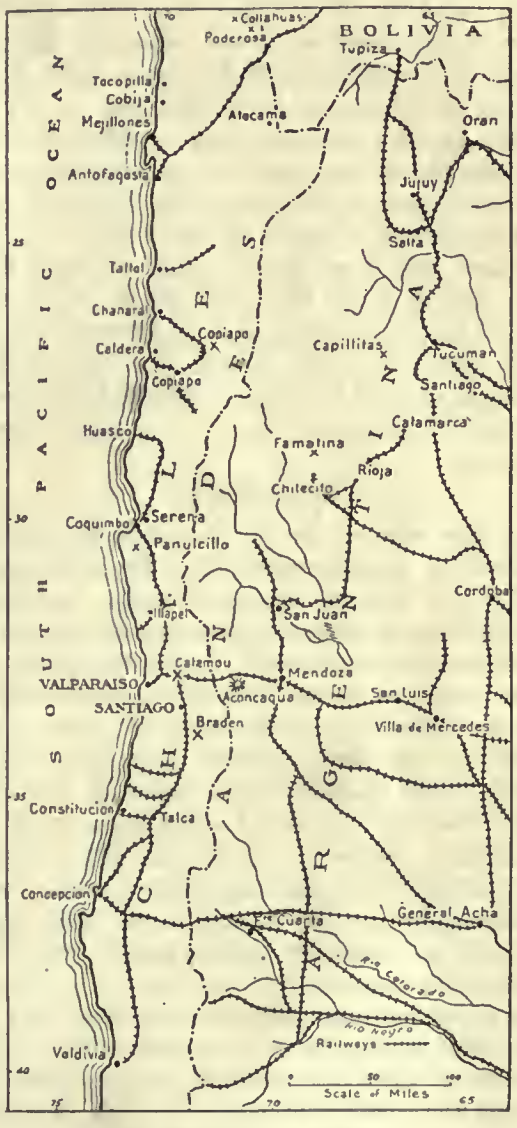
The copper-bearing ores in this district occur in fissures, in a porphyry feldspathic rock, running easterly and westerly. The porphyry shows a well defined stratification and is greatly decomposed and loosened. A number of intrusive dikes cross this country from northwest to southeast. Rich orebodies are found along these dikes on the contact with the porphyry. On the surface, oxidized copper ores are found (malachite and silicates) while at depth rich sulphides occur.

The climate at Collahuasi is dry and cold even in summer; snowstorms are frequent in winter, with infrequent rainfalls in summer. Water is scarce and is found only in a few small springs in the district. Vegetation is very scarce and is practically confined to a plant named *yareta*, which has neither branches nor leaves, but is formed by trunks that grow along the ground sending out roots which at intervals adhere to the granite rock; it takes its nutriment from the granite, decomposing the rock at the same time. The plant dies when the surrounding rock has been decomposed. The *yareta* is extensively used as fuel, its heating power being half that of ordinary steam-coal, and it costs $3 per ton at the mines.

Ordinary mine labor costs $1.50 per day of 10 hours. Two principal companies, out of a number of smaller ones, have properties and operate mines in this district. They are known as La Grande Mining Co. and La Poderosa Mining Company.

La Grande Mine

The La Grande Mining Co. has a capital of $500,000. It owns 160 claims in the district, with a total area of 1882 acres. Eight different copper



MINING DISTRICTS OF CHILE.

veins have been found running nearly parallel to each other from northwest to southeast. Twelve shafts have been sunk on these veins, the deepest shaft having a depth of 400 ft., with underground development of about 1000 ft. Exceedingly rich and abundant orebodies have been found, as may be judged by the following data taken from one of the semi-annual reports of the company, which states that "during the last six months the output of the five mines in operation was as follows: 5060 tons of ore of 30% Cu, 2592 tons of ore of 20% Cu. The ore reserves in the mines amounted at the end of the period to 85,791 long tons of an

average grade of 27.21%. The low-grade ore dumped in the waste pile amounted to 25,886 long tons of an average grade of 13.61% Cu." I understand that all the work carried on by this company is done without any machinery whatever.

La Poderosa Mine

The La Poderosa Mining Co. was organized in 1905, has $1,200,000 in stock, and owns 457 acres in the district. The ore deposit is contained in an important copper-bearing vein showing on the surface a length of over 8000 ft. Its strike is generally north 40° west, and its dip from 40 to 70° southwest; its width varies from 3 to 30 ft., the width of the orebody varying from 1 to 20 ft., with an average of 4 ft. Five mines have been opened on this vein, the most important being the Poderosa, at which a vertical shaft has been sunk 432 ft. From it six cross-cuts have been run at intervals of 73½ ft. to reach the vein at different levels; from the end of the cross-cut on each level drifts have been run on the vein, the different levels being connected by raises on the pitch of the vein. As stated, the depth of the vertical shaft is 432 ft., the length of the cross-cuts 492 ft., of the raises 1509, of the drifts 4264, and of intermediate drift 282 ft.; making a total length of underground development of 6970 ft. The ore blocked out amounts to 100,000 long tons of ore of an average grade of 24.4% Cu.

The Orebodies

The character of the ore found in the different levels of the mine is as follows: From the surface to the 220-ft. level, copper silicates, brochantite, and cuprite; sometimes malachite, azurite, covellite, and chalcocite are found. From the 220-ft. level to the lowest workings, sulphides predominate, including chalcocite, tetrahedrite, and some chalcopyrite; the primary sulphides have not yet been reached. The copper ores contain an average of 10 oz. silver per ton and a small quantity of gold. The hanging wall of the vein is generally well defined and formed of quartzite, the foot-wall is formed of decomposed porphyry and is not well defined. As a rule the porphyry underlying the vein is porous and impregnated with copper.

No water has been found in this mine, or in any other mine in this district. On account of the porous nature of the surrounding porphyry, whenever it rains the water percolates through the ground and in some instances there has been as much as 9000 gal. in 24 hours collected in the bottom levels of the mine from this source.

Equipment

The equipment at La Poderosa consists of three Babcock & Wilcox boilers, 120 lb. pressure, capacity 100 hp. At the main shaft there is a Fraser & Chalmers hoisting-engine, built for 350 tons capacity daily, wire rope of 1-in. diameter. The shaft is provided with a steel head-frame 60 ft. high, a weighing machine, one grizzly, tables for hand sorting of the ore, a small crushing plant with two 9 by 15-in. Blake crushers, electric driven, belt-conveyor, and storage-bins. A Reidler air-compressor, 100 lb. pressure, 500-cu. ft. capacity per minute, furnishes the air for 20 Murphy air-drills used underground. Four small steam pumps are in operation at different levels in the mine. The ores from the storage-bins are loaded in railroad cars and shipped to the port of Antofagasta, 300 miles distant, and exported crude to England. One of the last reports of the company shows for six months an output of 13,975 long tons of ore of 29.82% Cu and 10 oz. silver per ton.

Chuquicamata District

About two years ago the Guggenheim interests acquired property in this district; the property has been thoroughly prospected with churn-drills and proved to be a copper deposit of great importance. A steam-shovel mine is in course of development, comparable in magnitude and importance with that of the Utah Copper Co. I think that it may be interesting to give an idea of what this mining district was before the arrival of the American concern.

The Chuquicamata district (province of Antofagasta) is situated at 22°15′ south latitude and 87 miles distant from the Pacific coast in a straight line. It is in what is known as the northern region of the country. Its altitude is 10,000 ft. The climate is dry and tempered by the altitude. Vegetation is scarce. Some 15 miles south of the mining camps runs the River Loa in the valley of the same name. This valley is very fertile and is cultivated to some extent. There is a small town called Calama, with about 3000 inhabitants, situated in the valley. The mining camp is about 15 miles from this town and is connected with the port of Antofagasta by a narrow-gauge railroad 160 miles long.

The hills around Chuquicamata are formed of a white acid rock containing quartz and monoclinic feldspar. It may be classified as a granite without mica. This granite formation is crossed by a number of fractures containing copper and running generally north and south. The average width of these fractures is about five feet. When two or more veins come in contact, which is frequently the case, the mineralization spreads and reaches a width of 20 or more feet of high-grade copper ores. The gangue is of the same composition as the surrounding formation, but is greatly decomposed, the surrounding rock being solid and resistent. The veins show a few faults of little magnitude, with small horizontal displacement. No water has been found up to date in the mines. The predominating copper ores found are oxidized, due principally to the small depth of the mines. They consist principally of atacamite, brochantite, and cuprite, the former frequently in fibrous form; less frequent are the copper silicates, carbonates, and sulphates. In some of the deepest mines rich sulphide ores are found.

Surface Ores

Out of the system of veins mentioned above, there are in the district of Chuquicamata some irregular copper orebodies known in the country by the name of *llamperas*. The *llamperas* are in a portion of the mining camp above the level of the copper veins.

and it is believed that there is some underground relation between the *llamperas* and the veins. However, this has not yet been proved. The *llamperas* are apparent on the surface of the ground. They form in the above-mentioned granite rock, which is deeply decomposed and fissured. In these fissures is found the copper ore in oxidized forms which will average from 3 to 4% copper, in the form of brochantite, atacamite, and soluble sulphates.

Methods of Work

The exploitation of the *llamperas* is carried out in the following manner: The ground is broken by blasting. All the broken material is then passed over 10-mesh sieves; the fine is rich and contains about 15% Cu, while the coarse, which is sent to the waste pile, averages about 2%. This simple process of concentration is made possible from the fact that the ores are more fragile than the accompanying gangue. I understand that the *llamperas* form the base for the steam-shovel project in course of development by the American company. The method of treatment of the ores will be, as I have heard lately, by leaching and electrolytic precipitation. The necessary acid for leaching is derived from the same ores, while hydro-electric power will be generated in the River Loa and transmitted to the mines for power and electrolytic precipitation.

Smaller Mines

The mining district covers a large area of land, being 2½ miles long and probably about the same width. A number of companies had properties and worked mines in the district, the principal of which were: 'Compañia de Minas de Calama,' working 200 men and having an output of 1000 long tons of ore per month averaging 13.2% copper; 'Compañia Poderosa de Chuquicamata,' working 160 men and outputting 700 tons per month of 12.5% Cu ore; 'Mina San Rafael,' working 120 men and producing 200 tons per month of 18% Cu ore; 'Mina Aurelia,' employing 40 men and producing 100 tons per month of 13% Cu ore; 'Compañia Anglo-Chilian,' with an output of 70 tons monthly of 20% Cu ore; 'Mina Flor del Boquete,' with output of 60 tons per month of 15% Cu ore.

Besides the above enumerated concerns, there are a number of smaller companies operating in the district.

The Panizo

The neighboring 'Panizo' mine, owned by the Compañia Poderosa de Chuquicamata, is 450 ft. deep and at this level the vein has been proved for a length of 600 ft. The orebody is formed by a number of copper veins running north and south and having the general characteristics of the other veins in this district. The system of work is that of blocking the ore by means of levels and raises. The ore is hoisted through a vertical shaft, and 80 men are employed. Hand drilling is used exclusively, with black powder and dynamite for explosives. Underground transportation is made in small cars run by hand. Hoisting through the main vertical shaft is done by means of a steam hoisting-engine with a capacity of 2 tons from a depth of 1000 ft. Labor costs are as follows: Drillers, $1.50 per day of 10 hours; trammers, $1.25; surface men, $1.25. The output of the mine averages 275 long tons of 12.5% copper ore per month. The cost of mining and sorting per ton of ore ready for shipment is $10.

Probably 80% of the total output of the district is shipped to Antofagasta by rail and exported crude to Europe. The remainder of 20% formed by lower grade ores is treated in a small copper smelter near Calama, about 15 miles distant from the mines.

End

Shamva Reduction Plant

The reduction and treatment of the Shamva mine in Rhodesia was due to be running before the end of the year. Ore will be drawn out in the adits by petrol locomotives and deposited in a large storage bin. From this it will be fed into trucks and lowered by gravity to grizzlies placed over three No. 7½ Gates stone-breakers. After the oversize has been reduced in these the whole product, fine and coarse, will be deposited upon a belt-conveyor which discharges into trommels where the ¼-mesh product will be eliminated and sent direct to the tube-mills, while the oversize will be deposited into a bin feeding 56 Nissen stamps each of 2000 lb. weight and using ¼-in. mesh screen, the ore being crushed in cyanide solution. The capacity of the plant will be in the neighborhood of 50,000 tons per month and the cost of treatment is expected not to exceed 4s. 6d. per ton. After leaving the stamps, the pulp will gravitate to the feed-cones of eight 22-ft. tube-mills, using Osborne liners. The underflow of the cones will pass through the tube-mills over short copper plate and blanket tables, and thence to a centrifugal pump to be elevated back to cones again. The overflow of the tube-mill cones will pass direct to eight sand-cones superimposed over four others in which the sand will be classified out, and mixing with the barren solution from the slime plant extractor boxes will gravitate to eight 50-ft. by 8 ft. 6 in. sand collecting and leaching tanks in which the sand will be leached, washed, and deposited on the dump by rope haulage. The slime and solution overflowing the sand-cones will flow to five 35 by 10-ft. Dorr thickening tanks, part of the clear overflow of which will run to the extractor boxes and a portion back to the mill supply tank. The thickened pulp from the discharge of the Dorr tanks will be pumped up to five 45 by 10-ft. Pachuca tanks, connected in series, where, after air agitation, the slime pulp will run to the storage agitators connected to the Butters filter plant. The latter will consist of 336 leaves designed on the gravity system of working. All solutions will be precipitated in ordinary zinc extractor boxes and the gold slime smelted in two Morgan gas-fired melting furnaces.

Copper concentrate produced in February by the Elmore vacuum plant, at the mines of the Sulitjelma company in Norway, amounted to 1137 tons.

Chosen Mining Company's Reduction Plant

By J. D. Hubbard

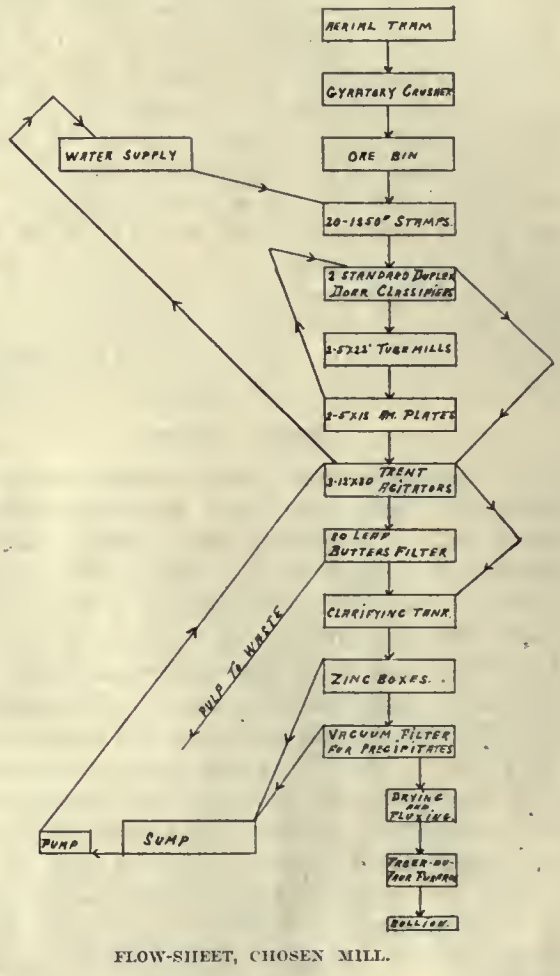
On the first of August 1911, the stock of the Chosen Mining Co. was placed on the market in Japan and Korea, and was quickly taken up by the investing public. Prior to this date the Morris-McGary partnership of Seoul had carried on considerable development and had brought the property to a point where it was considered in shape to put on the market. An article describing the location, capitalization, and ore estimation on this property appears in the *Mining and Scientific Press* of July 20, 1912.

While employed as metallurgist for the company I was instructed by the management to experiment on the ores in the Kosung orebodies, and to design a reduction plant for them. The Chosen Mining Co. has a splendid assay-office and laboratory equipment, probably the best in Korea, and over two months were spent in experimenting on the ores. The reduction plant shown by the accompanying flow-sheet was designed, and an order for the equipment placed with the Allis-Chalmers Co., which, as it happens, maintains the only mining machinery agency in Japan.

Mill Not Completed

The heaviest pieces of machinery for the plant, including crusher parts, mortars, and tube-mills, are now at Chinnampo, awaiting a favorable opportunity for transportation to the millsite. Completion of the work has been postponed by the present general superintendent at Kosung until such time as the ore reserves in the mine are in shape to meet the demands of the mill. An overestimation of the ore reserves on the part of the former management at the mines is responsible for the present condition and delay in the mill construction. The Chosen Mining Co. has a good property, however, and it will come into the rank of a real producer before long. The preliminary work of excavating and preparing foundations has all been completed, and figures of the low cost attained will, I hope, prove of general interest.

The plant ordered was for 600 tons daily capacity, and the excavations and retaining walls built on that basis. The first unit, for 200 tons, has been ordered and will undoubtedly go in at the proper time. The ore from the mine is to be conveyed to the mill by an aerial tram over a distance of one mile, and dumped into a 4-K gyratory crusher, and then into the ore-bin. Thence it is to be fed to 20 1250-lb. stamps crushing to four-mesh, in weak cyanide solution, and the pulp passing to two standard duplex Dorr classifiers, which overflow to a Trent agitator for dewatering, the coarse and fine material then going to two 5 by 22-ft. tube-mills fitted with El Oro lining. The product from the tube-mills is to pass over stationary silver-plated amalgam plates 5 by 12 ft. in size, and thence to Dorr classifiers. The coarse product will be returned to the tube-mills and the fine and slime will pass to a Trent agitator for dewatering. Three 12 by 30-ft. Trent agitators are to be used, one for filling and dewatering, one for agitating, and one for settling and thickening pulp for the Butters filter. Cyanide solution to make up full strength is to be added at the Trent agitator.



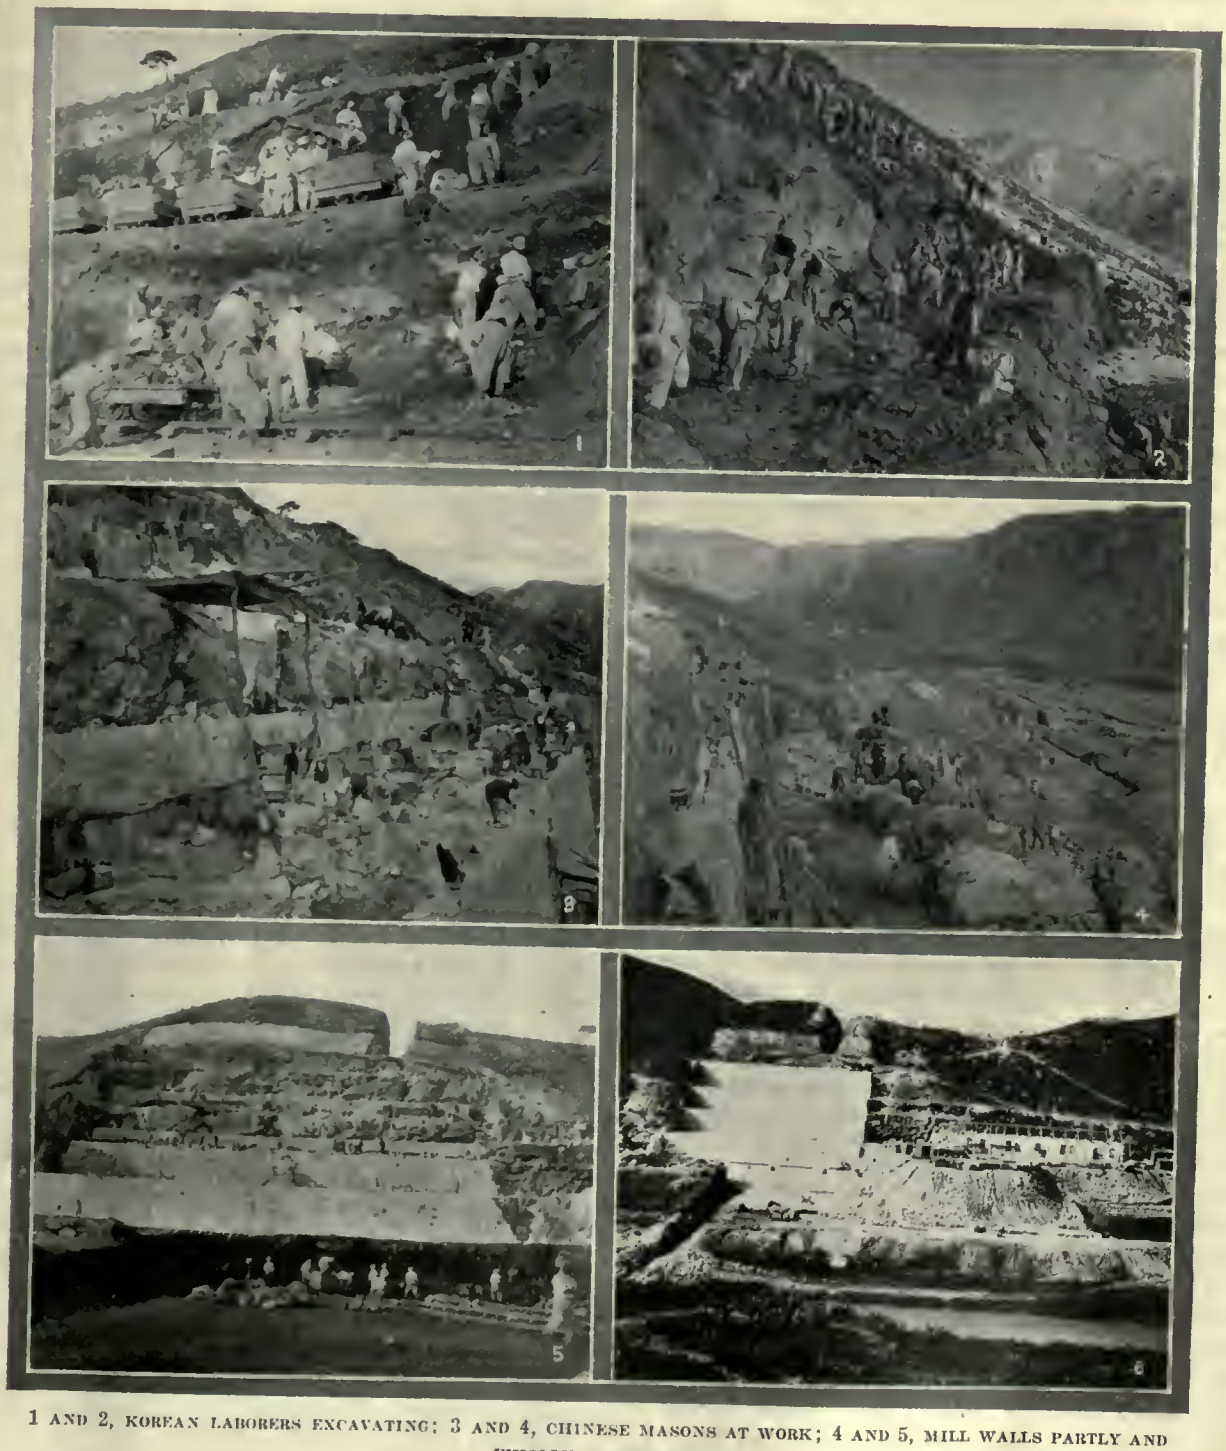
FLOW-SHEET, CHOSEN MILL.

The next unit consists of an 80-leaf semi-gravity Butters filter. From the filter the pulp passes to waste, with the gold-bearing solution to clarifying-tanks, and thence to the zinc-precipitation boxes. The gold precipitate is to be cleaned in a vacuum-box, and after drying to be melted in a Faber du Faur tilting furnace.

All the excavations and retaining walls for this pant have been competed and details of cost will be given here. On account of the low price of labor at Kosung, these costs are especially low and probably constitute a record. Management and office expenses are excluded from these items. All material from excavations was handled by pick and shovel, after blasting, and trammed in cars from 100 to 600

ft. The seale of wages paid was: coolies, 20c. per day; miners, 25c.. and bosses, 30c. to 40c. At these rates the laborers boarded and supported themselves and their families. It is hardly neeessary to state that the eost of high living does not bother the Korean. Ten hours was the working day. By a judicious weeding out of the useless and incompetent, careful selection of the native bosses, and a strict adherence to rules laid down for their protection by the superintendent, good results may always be obtained from Korean labor. The site was chosen by the general superintendent, the benches were laid off, and the excavations listed opposite were made.

Bench.	Dirt, cu. yd.	Rock, cu. yd.
Tramway	251.00	562.00
Engine room	415.00	830.00
Shops, etc.	3,200.00	80.83
Above ore-bin	450.00	81.20
Ore-bin	944.17	1,899.35
Battery floor	720.70	1,115.41
Tube-mill floor	1,269.30	2,538.70
Agitator floor	1,561.50	785.80
Fliter floor	801.85	16.72
Sump floor	709.90	211.45
Lower drain	1,105.55	27.60
On filter floor, extra	560.00	8.26
Totals	11,988.97	8,157.32



1 AND 2, KOREAN LABORERS EXCAVATING; 3 AND 4, CHINESE MASONS AT WORK; 4 AND 5, MILL WALLS PARTLY AND WHOLLY COMPLETED.

The total net cost of excavation per cubic yard is $0.330325. As over one-third of this material was rock, the actual cost is very low. All the cars, track, shovel, picks, hammers, ties, crowbars, etc., were turned over in good condition for use at the mine. Only those lost or broken, and the depreciation on them, are here charged. Owing to an unusually mild winter for Korea, the work was continued during

the winter months, only stopping on stormy days. Gloves were supplied during the coldest period. The coldest was 2° below zero, but the temperature quickly rose to 12°F. when the sun came out. The laborers found it expedient to work well to keep warm, although a Korean can stand a surprising lot of cold.

The detailed costs were as follows:

Item.	Cost.	Cost per cu. yd.
Native labor	$4.125.97	$0.204800
Superintendence	1,400.00	0.069485
Shovels	31.00	0.001535
Picks	2.96	0.000335
Pick steel	3.83	
Car rails, spikes, etc.	38.50	0.001910
Car oil	0.37	0.000015
Drill steel	29.54	0.001465
Hammers	3.00	0.000146
Hammer handles	10.29	0.000510

Depreciation on cars	7.50	0.000385
Charcoal	113.90	0.055665
Lumber	9.25	0.000465
Total	$6,654.79	$0.330315

Chinese Contract Labor

The contracts for the masonry walls were let to Chinese from Manchuria, who are excellent masons. The walls were built up of rough cut stone, granite laid in lime mortar, all nicely faced on the exposed surface. The Chinese have their own way of working as to time and are best left alone. They start early and continue work as long as the light lasts. But every half-hour they must stop for the customary smoke and rest, which lasts from 15 to 20 minutes. In net working time they put in about nine hours per day. A foreigner hiring these Chinese by the day would soon find himself in difficulties, as they would put up all kinds of tricks on him, and lying is regarded by them as a virtue when used against a foreigner. In construction work constant supervision is necessary. The Chinese are liable to work in rotten stones or to slight the mortar if not watched. Foreigners should be careful when exasperated not to strike these Chinese. Vitriolic language and a 'cussing out' in three languages, also a comparison of their work, generally has the desired effect. On the other hand, there is a certain proportion of worthless laborers of which even contractors cannot get rid. In my experience in handling many kinds of labor, I have found certain human beings who are positively not worth their salt and who would even spoil a rough stone if allowed to handle it. All the soap-box orators seem to carefully avoid the remedy for this class. To say they would put them at something they could do would be superfluous, for such people cannot drink water without mussing it.

The contract for the first masonry walls (No. 1, 2, 3, and 4) were let April 9, 1912, and the walls were completed by May 28. The contents of the walls and dimensions were as follows:

No.	Ft. long.	Ft. high.	Ft. thick.	Cu. ft.
1	130	13	3.00	5070.0
2	130	15	2.75	5362.5
3	130	15	2.75	5362.5
4	130	20	3.50	9100.0

Or, in all, 24,895 cu. ft. or 922 cubic yards.

Contract price (including labor and tools)	$2,025.00
Lime, 228,835 lb. at 37c. per 100 lb.	855.75
Sand—hauling, $48; labor, $18	66.10
Hauling stone from quarry	154.75
Rope, 25.5 lb. at 20c.	5.10
Use of company cart at 25c. per day	4.75
Lumber and timber	11.97
Surveying	7.50
Charcoal, 15 boxes at 85c.	12.75
Gellgnite (147 sticks), 60 detonators, 180 ft. of fuse	9.90
Special courier, re rinderpest quarantine	1.20
Hauling, company cart, 13.5 days, at $3	40.50
Total	$3,195.28

This gives an average cost of $3.46556 per cubic yard of masonry. The cost of material per cubic yard of masonry was:

Labor and tools	$2.196310
Lime	0.928150
Sand	0.071700
Hauling	0.216920
Timber and lumber	0.012950
Surveying	0.008135
Charcoal	0.013825
Gellgnite, detonators, and fuse	0.010735
Miscellaneous	0.006850
Total	$3.465545

The same contractors were given the work for the second and final contract, against some keen rival bidding on the part of other Chinese and Korean contractors. The contents of the masonry walls on this contract were as follows:

	Cu. yd.
Ore-bin end walls, east and west	54.26
Battery floor, east	12.22
Battery floor, end walls, west	16.66
Tube-mill floor, end walls, east	35.00
Tube-mill, end walls, west	32.66
Agitator floor, end walls, both	47.00
Filter floor, one wall	17.82
Sump floor, one wall	30.55
Filter floor retaining wall, 130 by 13 by 3 ft.	187.77
Sump floor retaining wall, 65 by 10 by 2.5 ft.	120.37
Total	504.31
Shop wall foundations contained	70.00
Walls (net) contained	152.00
Total	222.00

Totals for both walls, 20,957.50 cu. ft. or 776.31 cu. yd.

Costs

		Per yd.
Contract price, including labor, tools, sand, and hauling	$1,150.00	$1.481365
Lime, 167,368 lb. at 37c. per 100 lb.	622.49	0.801865
Drill steel (both contracts), 348 lb.	8.70	0.011205
Charcoal, 10 boxes	8.50	0.010945
Gellgnite, detonators, and fuse	0.94	0.001210
Surveying	6.40	0.008240
Lumber and cement	18.35	0.023635
Extra bonus to contractor	25.00	0.032205
Total	$1,840.38	$2.37067

COST FOR ALL WALLS

	Cu. yd.	Rate.	Amount.
First contract	922.00	$3.46554	$3,195.280
Second contract	776.31	2.37067	1,840.385
Total	1,698.31		$5,035.665

This gives an average cost of $2.965105 per cu. yd. for all masonry work completed. The final cost of excavating, $0.330325 per cu. yd. for both dirt and rock, and the final cost of the masonry per cubic yard are probably record figures for the locality.

All was not easy by any means. Many difficulties came up during construction, the most annoying of which was a quarantine for rinderpest clapped on the Korean cattle by the Japanese. As these cattle brought the lime in, we were compelled to suspend work for several days, finally overcoming the difficulty by relaying the lime bags to other cattle, at no additional cost to us. The Korean lime is of very high quality and makes excellent mortar. The average load that these Korean cows and bulls will carry is 300 lb., but a large bull will carry 400 lb. Contracts for lime in quantity were given to Korean contractors. I might mention right here that written contracts with Koreans generally are worthless, for if they make nothing they will soon come around with a tale of awful disaster to their distant family which needs their immediate attention, for which, like the Japanese, they are "very sorry," of course—that is, that they are caught at it.

Converter Practice at Bogoslovsk

*The converter plant of the Société Minière de Bogoslovsk, on the eastern slope of the Ural mountains is quite out of date (having been started in 1885) and consists of modified Manhès converters, the tilting being performed by hand; a modern plant is now being built. For reasons which will be given later the converters will be of the ordinary 4 to 6-ton type, although under other circumstances I should have preferred the large basic converter now in vogue.

The liquid slag from the converters which is not required for fluxing purposes is taken by the crane and tilted into the water-jacketed forehearth, in such a manner that the stream of liquid slag meets the slag and matte as they overflow into the forehearth. When, two years ago, this method of dealing with the bessemer slag was started, it was noticed that the dump slag was somewhat richer in copper than previously, undoubtedly due to a little rich bessemer matte going over; this was confirmed when a small settling pot was used; the matte which settled there being considerably higher in copper than the bulk of the matte tapped from the main forehearth.

The average copper produced from the Bogoslovsk company's ores contains only about $15 worth of gold and silver per ton, but, on account of its exceptionally high quality, it has been marketed as B.S. ingot copper. However, circumstances have arisen in the Russian markets which make it desirable to cast a certain proportion of the production into anodes for electro-copper. So as to obtain a return from the precious metals, I have introduced a system of concentration of the gold and silver in the anodes; this is attained in the following manner:

A first charge of matte is tilted into a converter and blown to slagging point and the slag drawn off; after the slag is removed from the converter a second charge is added and blown to slagging point, the slag is run off; after the slag is removed from a third charge the converter holds a working charge of white metal (about 65% Cu). This is blown until the pokers used for clearing the tuyeres show signs of metallic copper; the converter is hastily tilted and the white metal run into a special ladle and transferred to an adjoining converter, to be blown into blister for ingot copper; the copper bottom, containing practically the whole of the gold and most of the silver that was in the original matte, is cast into anodes. With very little practice it is easy to make bottoms representing the desired proportion of the total output of copper. With a large basic converter I fear it would not be possible to carry out this concentration of precious metals, and the blowing power at our disposal would not give sufficient pressure to work converters beyond 4 to 6 tons capacity.

The converters run about six charges without repairs; the lining consists of 80% silica sand and 20% plastic clay. The old linings are classified into rough (slaggy portions), and fines (—4 mm.); the fines are fed onto a Francis rapid concentrator, the concentrates from which, assaying 35% Cu, are briquetted with tar from the company's adjoining charcoal ovens, and thrown into the converters. The tailing (assaying 1%) constitutes an excellent material for mixing with fresh lining; if desired, tailing retaining only 0.25% of copper may be obtained by crushing the material down to 1 mm. before passing over the concentrating table.

*Excerpt from a paper presented before the Institution of Mining and Metallurgy, February 20, 1913.

Determination of Ash in Coal and Coke

By JAMES SMUCK

*Weigh one gram of finely ground coal or coke into a weighed platinum dish having a diameter of 2 to 3 in.; add just enough pure alcohol to produce a thin paste with the sample, and by manipulating the dish in the hands, run the mixture up around the sides of the dish, distributing a thin uniform film on the sides and bottom. Now evaporate off the excess of alcohol carefully by warming the dish, and place over a Bunsen or in a muffle furnace. In the former instance, heat the dish to redness and then place over a blast-lamp turned on full. In either case the carbon burns off readily. The success of the method depends upon distributing the finely ground sample over a large area which is easily accomplished by the method outlined. Twenty minutes is sufficient time for a determination, while the method in general use requires at least an hour, and the results check closely.

*Abstract from *Chemist-Analyst.*

Adequate Sampling in Modern Mill Practice

By Donald F. Irvin

Any reference to sampling and sampling methods postulates a material or materials to be sampled, which in modern metallurgical practice will be found to be extremely varied, even in a comparatively simple plant, and more so as the scheme of treatment is amplified and extra care is taken to secure proper and sufficient sampling. In the columns of technical publications the term sampling most often refers to underground development, though there is a much larger variety of samples taken in the average reduction plant treating precious-metal ores than in mine work, and a greater degree of accuracy must be observed in their selection. The following notes are based upon the current practice at a mine where hand sorting, wet concentration, and cyanidation are employed.

Grades of Ore Treatment

The mining department delivers two classes of ore to the metallurgical department, one being hand-sorted high grade in sacks, and the other the regular grade of mill ore to the crusher bin. The mill ore is crushed and screened over a grizzly, the fine passing directly to the mill-bins, over a continuous weighing and recording machine, and an automatic sampler, while the coarse ore is hand sorted. From the latter a small amount of high-grade ore is picked out, as well as some waste, and the remaining coarse ore joins the fine before reaching the weighing machine. In the milling department three products are made: coarse concentrate from jigs, fine concentrate from tables, and tailing, which passes to the cyanide plant. Thus there are six grades of ore in the milling department which require assay. These are handled as follows: The sacked ore from the mine, picked ore from the sorting belt, and jig concentrate, being in 100-lb. sacks, are each allowed to accumulate until there is a ton of any one grade, and then a sample is taken from the stacks, representative of the ton lot. This sample is checked later by one taken when the concentrate is loaded into cars at the railway shipping point, and another sample is obtained at the smelter. Waste is sampled daily by a grab sample.

Handling Concentrate

There remains the ore passing the automatic sampler to the mill-bins and the table concentrate. Inasmuch as the former is the basis for tonnage calculations, it is sampled for moisture as well as metal content, but the latter assay is not the one which is used in crediting the metallurgical department with 'ounces fine metal received', as will be shown later. All the concentrate is flumed to concentrate storage-bins, where excess water is removed, and in regular succession each binful is drawn out upon a cement floor, where it is sampled by spoon sampler, and then sacked in 100-lb. sacks. This concentrate, like the high-grade ore, is resampled upon arrival at the shipping point. It should be understood that all concentration is done in water, and thus no cyanide solution touches the concentrate at any stage of treatment. In addition to gold and silver, the concentrate and high-grade ore are assayed for copper and lead.

With the arrival of the concentrator tailing at the regrinding section of the mill, additional determinations are required by the introduction of cyanide solution, carrying dissolved metals and chemicals. Also, here begins a need for closer pulp sizing than in concentration processes, and a stricter regulation of pulp thickness. Above the classifiers supplying the regrinding tube-mills is placed an automatic Scobey sampling equipment, which takes a sample of the concentrator tailing and thus provides a head sample for the cyanide plant, as well as indicating the work done by concentration. This sample, however, is not taken as the absolute measure of that sent to the cyanide plant.

Cyanide solution first meets the pulp where the classified sand enters the tube-mills, and the dissolving of metals, with variation of cyanide content, continues in the tube-mills, reclassifying machinery, and thickening-tanks handling the reground sand. This sand having shown a pretty constant value, no regular assay of it is made. The original slime sent from drag-classifier A in the tube-mill department is thickened in mechanical settlers and then in a dewatering filter; from that point traveling to the agitating equipment jointly with the thickened slime from the reground sand. No separate assay of this thickened natural slime is made, as it bears a fairly constant relation to the value of the concentrator tailing, nor is there an assay of this composite feed to the agitators, for reasons given later.

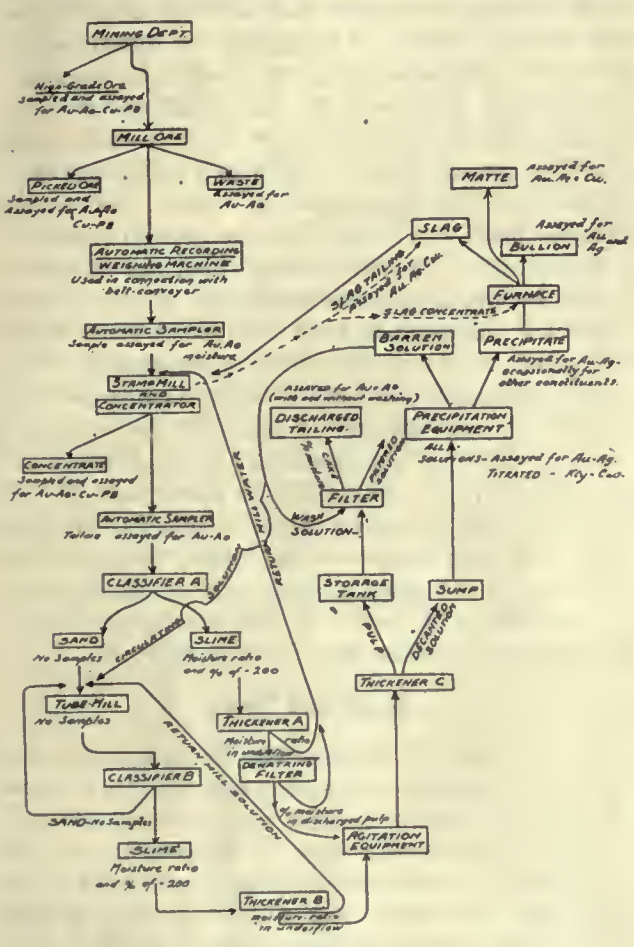
Sampling Sand

Included in this pulp is sand reground in tube-mills, coming from an old dump. This sand is sampled and assayed for gold, silver, and moisture, as it comes into the plant, and is weighed in an automatic recording balance, of tripper type, designed by the Avery Scale Co. of Milwaukee as a wheat scale. It is a very satisfactory machine for the purpose. After passing through a series of agitators, arranged for continuous agitation, the cyanide pulp is thickened and the decanted solution is diverted to a sump tank, while the thick pulp is stored in a filter-plant supply-tank. The term 'storage' is in this case merely a relic of the earlier nomenclature of cyanidation, as the pulp is flowing into and through the tank steadily and the variation of level of pulp does not exceed 1½ to 2 ft., as a rule.

From this tank a daily pulp sample is taken as a preliminary test of the filter tailing to be expected next day. This sample is, of course, a washed sample, and is a check upon the progress of the dissolution of metal in the process of agitation.

At the filter-plant four pulp samples are taken, the exigencies of the operations having developed a

need for that number. Three samples represent the three shifts on the filter-plant, and these samples are taken by hand in the tailing sluice. Because of the extremely tenacious and heavy lumps of filter cake, a Scobey sampler could not be depended upon to keep in operation, much less take a true sample; hence the hand sampling. The fourth sample is a composite of all three shifts, and is taken directly from the cake on the filter leaves. Filter cake varies in thickness from 1 to 1¼ in. Each of these four samples is prepared as two samples, a washed and an unwashed, the fourth sample always showing a lower soluble difference than the three taken from



SCHEME OF SAMPLING

the tailing sluice. This shows that filtration and displacement of soluble metals in the cake are good, but that soluble metals are introduced into the sluice by the use of weak barren solution, which is the means of dropping the filter cake. The cake sample stands as evidence of the degree of efficiency attained in the filter-plant, but the average of the samples taken from the sluice is the actual measure of metallurgical loss, and as such is the base from which all metallurgical returns are figured.

At this plant it is customary to regard

$$\frac{\text{metal content of tailing} + \text{recovery by cyaniding} + \text{recovery by concentrating}}{\text{total tonnage}}$$

as a measure of the average assay of the mill ore.

This figure is, of course, corrected for waste picked from the sorting-belt and for old sand tailing brought into the plant, at the tube-mills, as before mentioned. Although a calculated figure, it has been double checked for weeks at a time, by hand and by machine, and the three have been found to be reasonably close together. The calculated figure has been adopted as the standard, for the same reason that extraction figures are based upon bullion returns rather than upon indicated extraction as shown by assays. Hence, values taken for mine ore and concentrator tailing are not based upon the evidence of the automatic samplers.

Solution Assays

Two classes of pregnant solution are handled, one being the solution expressed as the filter cake is forming, and the other being the effluent derived from washing the cake with barren solution. No water wash is given. These two solutions are assayed and titrated separately for Au, Ag, KCN, and CaO, and after being precipitated are assayed and titrated again. There are other solution assays made daily, one being the solution in No. 1 agitator; another, the solution in the pulp discharged from the filter-plant. Besides these, a solution sample is taken for assay, occasionally, from the tank containing the excess wash solution, although as this solution is changed daily, there is little or no enrichment noted.

Precipitation is carried on in two circuits; the wash solution being completely precipitated, while the solution used in building up the agitator pulp is only partly precipitated. This method provides two classes of precipitate as well as two grades of pregnant and barren solution. The precipitate is assayed for Au, Ag, Cu, and Zn, as well as moisture.

It might be noted here that the effluent barren solution from the zinc presses is sampled by a ⅜-in. nipple tapped into the lower side of the main effluent-solution pipe. The nipple is fitted with a rubber tube and adjustable pinch-cock, which supplies a 2-litre bottle, the flow being regulated so as to fill the bottle in 24 hours.

During the first months of operations, before the nature of the precipitate was well established, complete analyses of it were made, and the following constituents, which make up 98 to 99% of the whole, were determined: Au, Ag, Cu, Zn, CuO, ZnO, Fe_2O_3, Al_2O_3, $CaCO_3$, SiO_2. After a time this was discontinued and only the first four metals were determined, the others being fairly constant.

Bullion Samples

When fluxing and fusing have been finished, the resulting slag and bullion, with the small quantity of matte accumulated from time to time, are separated and prepared for further treatment. The bullion is sampled while molten, by a dip into the potful of metal, the small portion taken being granulated by pouring it down an inclined plane, in a gentle stream of water. This sample checks more closely with smelter and umpire assays than bored samples, although previously three holes were bored in both top and bottom of the bars of bullion to a depth of two inches. The average of differences in silver content of the bars, between the bored and dipped samples, over a total of 60 bars sampled, shows 0.08% less for the dipped sample. The proportion of silver to gold by weight is over 200 to

1 in bullion. Bullion assays are made regularly for gold and silver and occasionally for copper. The zinc content is negligible. All base metal is usually considered as copper.

The slag is not assayed now as it comes from the pot, but is returned to the stamp-mill, where a special run with one battery is made monthly, and the crushed slag is concentrated on one Wilfley table. The battery clean-up and table concentrate are remelted as bullion, thus making a closed circuit. The slag tailing is caught in a concentrate-bin, and a sample taken from the bin in the same manner as for ordinary concentrate. Thereafter it is shipped to the smelter. The slag assay is made for gold, silver, and copper, it containing enough copper to be valuable for that metal alone.

Matte Treatment

Matte is not disposed of separately, but is resmelted in such a manner as best to clean it of gold and silver, and when reduced sufficiently in grade is broken up and shipped directly as concentrate. Generally, two passages of matte through the furnace will reduce it to a grade suitable for shipment, but it is a difficult product to handle satisfactorily, at best. It is worthy of note that this matte carries almost no gold but much silver, resembling chemically and physically stromeyerite.

All of the solution samples mentioned thus far are tested in the assay office and reported daily, but for the regulation of the treatment of pulp during the course of the three shifts, a titration equipment is in use in the cyanide plant itself, and titrations are made upon the solution contained in the first agitator of the series. It is not found necessary to make tests upon the succeeding tanks, as experience proved the course of extraction and attendant decrease in cyanide content to be so regular that it is now known to a sufficiently close approximation by the strength of solution in the first agitator. Cyanide consumption remains fairly constant, and as six titrations are made in 24 hr. there is never any very sudden change in the strength of the solution.

With the titration equipment is included a small set of scales, and a flask of known volume, wherewith the specific gravity of the pulp passing through the tanks is noted at the same time that the titrations are made. An increasing ratio of liquid to solid in the agitation pulp means decreasing capacity, increased amount of weak solution to run to waste, and greater tendency for the sandy particles of the pulp to settle in the agitators, or in the connections between them.

Screen Tests

There are other tests made at the assay-office, not requiring fire assay, namely, screen tests, and any special volumetric determinations. Screen tests are, naturally, required only in the regrinding and classifying sections, and the finished product from drag-classifiers A and B are both screened through 200 mesh and the per cent of –200 material noted daily on one sample each from the three shifts. Formerly the sand product from the drag-classifiers was screened also, but as it now is dependent upon mechanical upkeep of the machine for freedom from slime, rather than regulation of pulp, screen tests are no longer made upon it.

Occasional screen tests are made also upon the underflow, and feed to the vortex classifier, which prepares the battery pulp for concentration. Inasmuch as this machine depends upon positive pressure of water rather than the static balance of the pulp in a drag-classifier, regulation is not effected in the same manner.

The pulp as it enters the No. 1 agitator is resampled for a screen test, and the per cent of –200-mesh material contained therein is an actual measure of the fitness of the pulp for agitation: 85 to 90% of –200 mesh being the proportion sought.

The same samples from the classifiers are estimated by hydrometer for their liquid to solid ratio (as they operate best at 5 or 6 to 1), and any deviation from this proportion is noted and proper changes made to restore it to the desired ratio.

The water overflowing from thickener A is also tested by hydrometer to obtain the liquid to solid ratio, for whenever it fails to overflow clear water, the small weight of fine slime in the muddy water being returned to the head of the mill contains metal which will salt the sample taken by the automatic sampler, between the concentration department and the cyanide plant. Formerly the percentage of –200-mesh pulp discharged by the tube-mills was observed daily, but this sample is no longer taken, as the overflow of the classifier is a perfect indication of the grinding: a result of the maintenance of a closed circuit by the classifier and tube-mill.

Occasional Tests

Among other determinations regarded as occasional or special in their nature are analyses of chemical supplies received—lime, cyanide, and zinc dust—and any determinations of constituents of cyanide solution other than the daily titrations for cyanide and lime. These are made from time to time, but not daily, with special volumetric work on cyanide solutions when conditions seem to require it.

No mention has been made of experimental work, which, in the nature of such things, requires a complete determination of metals and chemicals present, with screen tests, specific gravity determinations, per cent of extraction obtained under varying conditions, and other points. It will suffice to say that there is experimental work carried on relative to concentration and cyanidation questions pertaining to this property, and in every case a full and instructive set of samples is taken, proportionate in number and accuracy to the experimental equipment and the nature of the information sought. Miniature air-agitators, a small pressure-filter, and two small concentrators (one of the Wilfley type and the other of the Deister) comprise the bulk of the special testing equipment that cannot be improvised from the regular assay-office supplies.

Apart from any question of absolute value lost in discharged tailing, whether 50c. per ton, $1, or $3, I believe that a greater disrepancy and more misleading data can arise from inaccurate estima-

tion of ore received for treatment, and more importance attaches to it, than to any other factor in the field of metallurgical control, and this increases with the value of the ore. For instance, it seems folly to debit a reduction plant with 105 tons of ore as a day's run, based upon 70 carloads, each of which is estimated to contain 1.5 tons of ore, when 15 or 16 cars may be drawn from a wet chute, with a moisture content of 6 to 10%, and the balance of the cars perhaps containing ore with 2 to 3% moisture. Also, some of the ore may be slabby and may occupy much space. In this case, when the mill returns 90% actual recovery upon 90 or 95 tons of ore, dry weight, it appears to have made a bare 80% recovery or possibly less, upon the false assumption of 1.5 tons per car. The opposite result may be reached with fine dry ore, but it is seldom that such ore comes from underground in any quantity.

Small track scales over which the ore-cars may be run furnish a satisfactory outlet for the small property that cannot afford an automatic recording machine for weighing the ore, and the absolute accuracy attending all metallurgical calculations involving tonnage thereafter justifies their purchase many times over. There are few mills that cannot admit such construction between hoist-bin and crusher, and with the gross weight thus established accurately, it is an easy matter to take moisture samples by some form of automatic sampler. At the property mentioned in this article the recording weigher checks to within 0.5% of absolute accuracy.

Tailing Samples

Tailing, whether sand or slime, is generally low in value and easily sampled, so that the operator of a plant can readily obtain his metal input, metal loss, and net production at once, regardless of any intermediate steps, and no matter how important they may be for the purpose of proper regulation of the daily course of treatment. Accurate sampling of mill pulp of average value presents no great difficulties, if only the sample cut may be taken where the stream is dropping from one level to another. If this is not possible, a launder cut-out is well worth installing, as sand and heavy particles traveling on the bottom of the launder make pulp samples that are dipped from a stream flowing in a launder almost worthless. The simple fact that a sample is valuable only as it embodies the information sought, regardless of whether it is taken according to traditional methods or not, and that its value is proportionate to the degree of accuracy obtainable under the given set of conditions, should be the basis of sampling. Thus, a thickening-tank performs the function of dewatering, and under any ordinary conditions the ratio of moisture in the feed and discharge show its efficiency once the tonnage of dry pulp sent through it is known. When such a machine has become established in routine, between certain limits, there is no feed for further sampling. On the other hand, a vacuum-filter operates both as a dewatering machine and as a displacer of dissolved metals. This is important enough to justify frequent samples, to obtain the percentage of efficiency of each branch of its functions, and can never be omitted without loss of valuable data.

A consideration of the real informative value of each step in sampling has governed the final form of the sampling schedule on this property, and from that logical standpoint has been found to be satisfactory. Other samples are possible, but they have been considered to be of no economic advantage; nor is this due to any false economy in assaying expense, as the assay office turns in a monthly bill to the metallurgical department for 1500 to 1800 assays, each one of which is known to 'pay its way.'

Chilean Iron Ores

The Tofo iron deposits recently purchased by the Bethlehem Steel Co. from the French company mining them, are situated near the bay of Cruz Grande, in the province of Coquimbo, Chile. The broken ore is transported on a Decauville railway to the central station of an aerial ropeway (Pohlig system), 7.2 km. long, connecting with Cruz Grande, the present ropeway having a capacity of 40 tons per hour. A quay with a 35-metre bridge has been built in Cruz Grande harbor, which allows vessels to receive their cargo direct by chute, the present loading capacity being 1000 tons per diem. The bay is well protected from northern and southern winds, but is still open to the west. The aerial ropeway, it is understood, is already being doubled by the Société des Hauts-Fourneaux du Chile, but it is evident that it must be still further increased to supply the Bethlehem steel works, as the present capacity, allowing for break-downs and bad weather, is estimated at only 25,000 tons per year. To work the mines the Bethlehem-Chile Iron Mines Co. has been incorporated in Delaware, with a capital stock of $4.000,000 in 5% bonds. The financing, it is understood, will be done mainly by the bankers who are associated with Mr. Schwab. It is proposed to build a fleet of 10 steamers of 15,000 to 20,000 tons capacity to transport the ore through the Panama canal to the works.

Eagle River Mines, Alaska

According to the U. S. Geological Survey, the first gold mining in Alaska was done in the so-called Juneau gold belt, where operations were begun over 30 years ago. The value of the gold produced in this region is more than $50,000,000. Most of this gold has been taken from the famous Treadwell and other mines near Juneau. The auriferous belt is, however, known to stretch for some 50 miles to the north, and includes the Eagle River region, described in a report by Adolph Knopf, just issued by the Survey as Bulletin 502. This report, unlike many others on mining districts in Alaska, which are of a reconnaissance character, treats of the region in detail. It is entitled 'Geology and Mineral Resources of the Eagle River Region, Alaska,' and is accompanied by a topographic map on a scale of a mile to the inch, with 100-ft. contours, by J. W. Bagley, and a detailed geologic map on the same scale. Gold-bearing lodes constitute the only mineral resources of the Eagle River region now under development.

Cost Sheets for a Dredging Company

Below are presented the forms used by the Ophir Gold Dredging Co. for keeping track of dredging data, expense, and income. They are published through the courtesy of the company.

Lead Production in 1912

The final figures of the production of lead in the United States in 1912 have just been published by the United States Geological Survey. These figures have been compiled by C. E. Siebenthal, of the Survey, from reports of the output of each lead smelter and refinery in operation in this country in 1912. The leading features of the report given herewith. Three tables are included. The first one shows the estimated world's production. Following it is a table showing the lead smelted in this country from ore from each lead-producing state and from each foreign country furnishing ore for treatment. These figures include soft lead, lead content of bullion (that is, 'work lead') and antimonial lead, and their total necessarily does not agree with the total refined lead output of the country, shown in the third table. Figures of production from 1907-1912 have been re-east and the new table supersedes earlier ones.

The refined lead product cannot be apportioned according to source of ore, owing to the fact that lead refiners treat smelted products whose origin may, as in custom refining, be unknown to them, the identity of the ore, and thus its original source, being preserved only as far as the smelter. Accordingly the table showing source of lead smelted or refined in the United States is based on smelter figures. It includes 'pig' lead reported by all smelters using Mississippi Valley soft lead ores and 'lead' produced at all other lead smelters in this country. A part of the product reported by smelters operated in conjunction with refineries is in terms of refined lead. A like part of the antimonial lead product is thus eliminated from the 'lead' produced and appears only in the figures of

THE WORLD'S PRODUCTION OF LEAD 1906-1911.

[1] Primary lead is that smelted from ore.

production of antimonial lead. No lead ore from the United States was treated elsewhere during the period covered by the table. The statement of the production of refined primary lead embraces all desilverized lead produced at works in this country and the pig lead derived from Mississippi Valley soft lead ores. The pig lead derived from Mississippi Valley ores and desilverized is shown separately. The antimonial lead reported by refineries is also given. The original source of the ore and bullion affording this refined product is shown in detail in the accompanying table showing primary lead smelted or refined in the United States.

PRODUCTION OF REFINED PRIMARY LEAD IN THE UNITED STATES.

PRODUCTION OF SECONDARY LEAD IN THE UNITED STATES.[2]

Pig lead	10,039	7,858	18,360	29,492	27,389	[3] 28,500
Lead in alloys	15,508	10,543	23,327	25,939	26,895	[3] 34,850
Total recovered lead	25,547	18,401	41,687	55,422	54,284	[3] 63,350

[1] See explanatory note
[2] Secondary lead is that obtained by refining skimmings, drosses, old metals, etc.
[3] Subject to revision; statistics not yet complete.

The total production of refined lead in 1912 was 480,894 short tons, which is 71 tons less than the estimate given out by the Survey on January 2, 1913, and published in the *Mining and Scientific Press* January 4. This quantity is exclusive of 13,552 tons of antimonial lead. The total of refined lead is made up of 88,377 short tons of desilverized lead of foreign origin, 221,480 tons of desilverized lead from domestic ores, 141,248 tons of domestic soft lead, and 29,789 tons of desilverized domestic soft lead. The value of the whole quantity of refined lead was $43,280,460; of this the domestic lead was worth $35,326,530, calculated at 4.5c. per pound, the average New York price for the year. The total refined lead output was less than that for 1911 by 6085 short tons, a decrease of 1.2 per cent.

Among the states, Missouri had the greatest output—162,610 tons, a decrease of almost 20,000 tons from that of the previous year. Idaho had the next largest production—127,707 tons, a gain of 10,372 tons over the output of 1911.

In the absence of complete figures of domestic stocks, it is not possible to calculate consumption except for the lead of foreign origin. However, by taking into account domestic production and foreign imports, exports, and stocks in bonded warehouse, it is possible to estimate the quantity of lead available for consumption from year to year. On this basis the lead available for consumption in 1912 was 410,953 tons, an increase of 11,766 tons, or 2.9%. Whether this represents an increase in consumption or in domestic stocks is not determinable.

The report includes a graphic chart showing the fluctuation of the price of lead at New York and London for the period 1906-1912, a list of lead smelters and refineries in the United States, and tables of imports of lead by countries and by classes, as shown by the records of the Bureau of Foreign and Domestic Commerce. The general imports of lead show a continued decline from 1909, when 225,090,312 lb. of lead was received to 1912, when the imports were 167,121,592 lb. Of the 1912 imports, 159,455,664 lb. was received from Mexico in the form of ore or base bullion, 3,207,936 lb. of lead in ore from South America, and 3,309,356 lb. from German East Africa.

Milling Costs at Bodie

The Standard Consolidated Mining Co., Bodie, California, treated 8024 tons of ore and 16,569 tons of tailing during 1912, with 86.6% extraction, and costs of milling and treatment were as follows:

Mill	Per ton.
Labor	$0.926
Supplies:	
Shoes	0.039
Dies	0.057
Heads	0.004
Liners	0.011
Screens	0.012
Plates	0.034
Quicksilver	0.011
Firewood	0.070
Sundries	0.143
Total supplies	$0.381
Bullion charges	0.062
Distribution accounts	0.553
Total, mill	$1.922

Cyanide Plant	Per ton.
Labor	$0.854
Supplies:	
Cyanide	0.269
Lime	0.192
Zinc	0.058
Pebbles	0.020
Lead acetate	0.013
Firewood	0.031
Sundries	0.197
Total supplies	$0.780
Bullion charges	0.071
Distribution accounts	0.395
Total, cyanide plant	$2.100
Administration	$0.974

BOSTON

Raid on Butte Central.—Nevada-Douglas Plans Bond Issue.—Difficult Financing Abroad.

A sensational episode on the Curb market on March 20 was the selling of Butte Cenral down from 5⅝ to a close of 2⅝, a net loss in a day of three points. There were something like 17,000 shares of stock dealt in and perhaps 10,000 shares actually changed hands. The decline was said to be due to the closing out of loans around $3 per share which were made when the stock was selling above $6. For some time the Butte Central management here has been involved in a controversy with various interests, and the vice-president, Mr. Davison, made a statement in the Boston *Post* to the effect that a wealthy capitalist here had employed a mining engineer to write an adverse report on Butte Central as part of a well laid campaign plan to go short of the stock and break down the price, covering at a profit. Mr. Davison also stated publicly in the *Post* that a blackmailing proposition had been made to him by members of the Boston Curb firm, offering, in consideration of large gifts and concessions in stock, to turn over to him the report referred to and assist him in making a market for the stock. He says that, recognizing the character of the demand made upon him, he stated to the Curb firm in question that he would not pay a dollar for the purpose of suppressing a sandbagging report. Rumors were also put afloat in Butte at the same time derogatory to the company and the State Savings bank there refused to advance the payroll for February, as usual. This was a matter of about $6500. The Western floods and damage to telegraph lines interfered with communication with Butte, and the ugly rumors, which were said to be propagated by enemies of the Butte Central interests, got quite a start. However, the embarrassment to the company was but slight, as funds and instructions were telegraphed as soon as the wires got to working. The mine management estimates that the concentrate in transit to the smelter from the company's new mill amounts to around $30,000, for which settlement is yet to be received. Company officials here claim that with funds now on hand the company should become a self-sustaining enterprise and that good earnings will soon follow. In other words, the raid on the stock was purely a stock market affair, affecting only certain interests connected with the company, and in no way reflects upon the intrinsic value of the enterprise.

The Nevada-Douglas Copper Co., of the Mason, Nevada, district, will hold a stockholders meeting in Salt Lake City on April 16 next for the purpose of authorizing a $2,000,000 bond issue for the purpose of taking up a convertible bond issue of $600,000 which expires May 1. It is announced that the purpose of the bond issue further is to acquire the stock and bonds of the Nevada Copper Belt railroad, of which the copper company now owns 50%. Another purpose is to purchase or erect a smelter and provide further working capital for developments and equipping property. The feeling in Boston is that the Nevada-Douglas property is sufficiently large for such a bond issue, but in view of the fact that in February the company made a dividend payment of 12½c. per share, which was regarded at the time as premature, there is a disposition to question the soundness of the plans of the present management. Of the $5,000,000 stock capital of Nevada-Douglas, considerably over $4,000,000 has been taken from the treasury. The addition of $2,000,000 in bonds places a heavy burden upon the company and will undoubtedly postpone the payment of further dividends indefinitely. The Nevada-Douglas company will have to operate a very large mining property, a railroad, and a smelter, and there is grave question as to whether these enterprises can be placed on a fair footing under the present policy. The company has a contract with the Mason Valley smelter to take its ores which expires by time limitation about the end of the year. The Nevada-Douglas management has claimed that its treatment charges have been excessive and advocates the building of a smelter. It is evident that in the greatly disturbed condition of the money and stock market, Nevada-Douglas interests are undertaking, without the assistance of large bankers or underwriters, a job of financing which, while perhaps necessary, will be extremely difficult to carry through.

JOPLIN, MISSOURI

Zinc Prices Lower.—Dewatering Screens Grow in Popularity.—Rejuvenating Mines of the Baxter-Quapaw District.

Zinc ore prices are much lower than they were for the corresponding week of 1912. The offerings have dropped to $40 and $48 per ton, assay basis of 60% metallic zinc, while the best figure reported paid for choicer lots is $51 per ton. For the corresponding period of 1912 the basis range was $48 to $53 per ton, with a top price of $56 for better grades. Spelter, which was quoted at $6.50, East St. Louis figures last year, is now weak at $5.90, although orders for future delivery have been placed at figures in excess of this. In order to strengthen the market, many of the largest mine operators suspended operations in March, and the weekly production of sulphide ores was cut from 7000 to 3000 tons, but a resumption of activities toward the close of the month swelled the output to 4500 tons. The shutdown had little effect on the market, prices showing no disposition to strengthen to any material extent. The heaviest curtailment was in the low-grade, thin-ground, sheet-ore district of Webb City, the average weekly output from this camp alone being cut from 2000 tons to 1100 tons. The price of oxidized ores, known as calamine, is weaker, the bulk of the output selling for $22, basis of 40% metallic zinc. Lead ore prices have remained steady at $52 to $54 per ton, assay basis of 80% metallic lead. Pig lead has remained unchanged at $4.20 to $4.25 per hundred pounds, East St. Louis.

The importance of slime treatment is growing throughout the Missouri-Kansas-Oklahoma district, and today the majority of the larger milling plants are equipped with tables. A feature of the sludge treatment that is also rapidly gaining in popularity is the dewatering screen, a revolving device, used for the first time in this district several years ago at the Oronogo Circle Mining Co.'s property at Oronogo, Missouri. Since then various companies have adopted screens of similar design, the device being so simple that it can be quickly made at any machine-shop. The screen takes the water from the tailing, the latter going in an almost dry state to the elevator, while the water, with the fine ore particles in suspension, passes to settling-tanks, from which the sediment is later drawn off and cleaned on tables. The use of the dewatering screen eliminates the cleaning out of sludge ponds, as a very small percentage of metallic contents escapes in the limited volume of water that passes out with the tailing.

M. G. Estabrook, a Boston capitalist, who operates the Amalgamated mine at Joplin, and the Mission mine at Lincolnville, Oklahoma, has leased from Jay F. Ripley the Okla mill at Lincolnville and will begin operations soon. The resumption of work at the Mission was the first activity of importance in the Quapaw-Baxter district in many months. In the bins of this mine at present there are more than 100 tons of zinc sulphide concentrate, being held for higher prices than now exist. Both the Mission and the Okla mills are of large capacity, the former being estimated at 500 tons per day, while the latter can handle 300 tons of ore. The dirt, as a rule, is very low in blende, but at the Okla it is reported that six new drifts have been extended into sheet ground, at a depth of 100 ft., which shows more than 5% blende.

Drill prospecting on an extensive scale has been started in the Spring City-Saginaw district, of Newton county, Missouri. Heretofore the greatest prospecting has consisted of shaft-sinking and driving, and as a result the operations have been confined largely to the upper ground. On leases of the Connor land two drills are now being worked, the company having outlined a campaign of activities to con-

tinue a year. All holes are to be sunk to a depth of at least 200 ft. or more. Heretofore the mining has been nearer the 100-ft. level and oftentimes at much shallower levels.

TORONTO, CANADA

HOLLINGER REPORT.—PEARL LAKE.—MCENANEY.—DOME LAKE —KIRKLAND LAKE DISTRICT.—NIPISSING STILL LEADS AT COBALT.—MCKINLEY-DARRAGH PROFITS.

The principal interest as regards Porcupine mining affairs attaches to the regular four-weekly statement of the Hollinger, according to which the profits from January 1 to February 25 were $241,600. For the four weeks ended February 25 the mill ran 91% of the possible running time, alterations somewhat reducing the tonnage treated, which amounted to 9240 tons, or an average of 330 tons per day. The average value of ore treated was $27.76 per ton, and the approximate extraction 97%. Milling costs were $1.49 per ton, and alteration charges 20c. per ton. Satisfactory results are being obtained underground. Work on No. 1 vein on the 300-ft. level shows the gold content to be about equal to that on the upper levels. The favorable character of the statement resulted in a decided advance of the stock in a generally quiet and depressed market. R. W. Stevenson, managing director of the Pearl Lake, reports that at 600 ft. the vein shows a marked improvement in gold content over the 400-ft. level, a mill test of 300 tons indicating the value of ore at the lower level at $35 per ton. The shaft will be put down to 1000 ft. and levels run at each 100 ft. A mill of 250 tons daily capacity, with equipment for cyanide treatment, will be erected. The McEnaney mill is now in regular operation, treating 50 tons of ore per day. The first shipment of ore was made March 1, and monthly consignments will be regularly made. The adit on the 200-ft. level has been opened up for 600 ft., practically all in ore. At the Dome Lake, good progress is being made with the 10-stamp mill, which is expected to be in operation by the middle of April, with Thomas E. Selby, formerly of the Dominion Reduction Co., Cobalt, in charge. The 5-stamp mill of the Swastika has been put in commission with sufficient ore in sight to keep it running 18 months or more. The mine is opened to the 400-ft. level, though little work has been done at that depth, and development at the 200 and 300-ft. levels has not been as satisfactory as was anticipated. The annual financial statement showed receipts of $75,514, and expenditures $73,995, leaving a balance of $1517. At the Tough-Foster property in the Kirkland Lake area, the shaft is down 70 ft. on a 12-in. vein, from which 20 tons of high-grade ore is being taken daily. The mill machinery is on the ground, and it is hoped to have it installed by the end of April. The Great Northern Silver Mines, Ltd., has purchased the Hughes or Reamsbottom claims in the Kirkland Lake district, where there is a 100-ft. open-cut on a 12-in. vein from which high-grade ore has been extracted. The Pike Lake, which has four claims near the Swastika, is arranging to install a 10-stamp mill.

The Nipissing maintains its position as a leader among the Cobalt companies and has been doing very well lately. Since the beginning of the year it has shipped $589,368 in bullion, in addition to 453 tons of low-grade ore. The new low-grade mill is running to capacity, treating during February over 200 tons per day. On the Little Silver vein, one of the first orebodies worked in the camp, an ore-shoot has been developed about 75 ft. below the old open-cut, the vein being about 2 in. wide of 3000-oz. ore. The company has bought three gold claims near Larder Lake for $50,000. The La Rose, which rather disappointed its shareholders by cutting out the extra bonus of 2½% paid for the first quarter of the year, has also added to its ore reserves. Cutting into new ground at the 115-ft. level of the Lawson property on No. 8 vein, a vein 4 to 5 in. wide, yielding ore reported to run over 5000 oz. silver per ton, has been discovered. The McKinley-Darragh, in addition to its regular quarterly dividend of 3%, has declared a 7% bonus. Its net profits for 1912 were $1,153,848, and the total cost per ounce 18.59c. Although 2,717,383 oz. was extracted last year, the ore reserves showed but little diminution, being estimated at 5,368,500 oz., or within 200,000 oz. of the estimate at the end of 1911. The Penn-Canadian, operating the old Cobalt Central property, has cut at the fifth level the Big Pete vein from which good ore was obtained on the upper levels. At depth it runs 2½ in. of high-grade ore, with good milling rock on each side of the vein. At the Beaver mine, 60 men went out on strike on March 22 on account of the discharge of an employee, and development is at a standstill. The Beaver Auxiliary at Elk Lake will start work with the new plant early in April. The first work will be the deepening of the shaft from 100 to 200 ft. The Peterson Lake will sink a shaft near the junction of Cart Lake and Peterson Lake, in the conglomerate in territory hitherto but little explored. A movement presumably in the interests of an English syndicate is on foot to acquire a controlling interest in the company, and stockholders are being asked for options. Since the success of English companies in putting the Cobalt Townsite and the Casey Cobalt on a paying basis, there have been several purchases of Cobalt properties by English investors, and agents of English syndicates have been active in negotiating for other properties.

NEW YORK

MONEY MARKET STRAINED.—BRITISH COLUMBIA PASSES DIVIDEND, BUT UTAH CON. PAYS ONE.—MASON VALLEY, NEVADA-DOUGLAS, OHIO COPPER, PHELPS-DODGE REPORTS.—DEVELOPMENT COMPANY AFFAIRS.—HAMMOND SUED.

The week ended March 29 has been one of feverish scanning of telegraph bulletins from the scenes of disaster in the Middle West. The tornado and the unprecedented floods were as one shock to the market. There has been no marked fall in price levels, but financial forces are gathering reserve strength to meet the demand that is sure to come. Only more than ordinarily careful analysis of conditions and events can reveal to those outside of banking circles the strain which our finances have undergone since the outbreak of hostilities in southeastern Europe, when England, France, and Germany all began to turn fixed into fluid capital. American securities have been returned in vast quantities; the United States has been making enormous gold shipments to bolster up foreign reserves; we have gone through a change of administrations, during which time we have had to handle an exceedingly difficult situation in Mexico, and now are brought face to face with disaster at home, second in magnitude only to the San Francisco earthquake. The market has had its own troubles, but the real question at the moment is not why it cannot do better, but as to how it can do as well as it does.

The market in copper metal has been rather featureless; the coming report of the Copper Producers' Association is expected to show a fair increase in accumulated stock and to offset some of the increase in copper surplus of the past quarter. The underlying factor in the metal market is the industrial situation abroad, and it is exceedingly hard to predict the turn of affairs in the financing of the demands made by the war. When the April 1 settlement shall have been completed abroad, the feeling will be much easier. The British Columbia Copper Co., as was anticipated to a certain extent, passed its regular 3% quarterly dividend when the postponed meeting was held on March 25. The action of the board was explained by the following statement: "The net earnings of the British Columbia Copper Co., Ltd., after charging off all ordinary development work for the last fiscal year, were $425,985. During the same period, the company paid on account of new property, and in exploration and development, $229,489. The company also has under option numerous properties upon which payments are to be made during the coming year, and the directors deem it best to use the available net revenue for that purpose, which is thought essential for the purpose of supplementing the company's ore reserves, and therefore consider it expedient to defer distribution to the shareholders for the present."

It is also understood that the British Columbia is increasing its holdings in the New Dominion, in which it already holds practically a two-thirds interest. The Utah Consolidated Copper Co. has declared a dividend of 50c. per share, payable April 12. During the past year the output was 6,506,814 lb. copper, 8,734,398 lb. lead, 230,004 oz. silver, and 14,042 oz. gold. The net profit won from the year's operations amounted to $603,923. The management states that it has been able to maintain its ore reserve, but that the average metal content is somewhat lower. The annual report of the Mason Valley Mines Co. for the year ended December 31, covers its first period of actual mining operations and shows a total income of $2,663,106, total charges $2,376,830, leaving a credit balance of $286,276, from which there is to be deducted interest on outstanding bonds of $59,379, leaving a profit-and-loss balance carried forward to surplus of $226,897. The Nevada-Douglas Copper Co. is to have a stockholders' meeting on April 15 for the purpose of authorizing an issue of bonds to the extent of $2,000,000, to be secured by a lien upon the various mines and upon the stock of the Nevada Copper Belt Railway Co., which is a subsidiary of the Nevada-Douglas.

There has been a considerable revival of interest in the affairs of the Davis-Daly Mining Co., owing to the report of the finding of ore on the 1400-ft. level, showing 10% copper and good amounts of silver. It is also stated that on the 1900-ft. level in the Colorado mine the vein discloses two to three feet of solid copper glance, assaying 50% copper. The Davis-Daly suffered for many years under the Heinze management. It is to be hoped that the stockholders who have been faithful to the company will now have some opportunity to recoup themselves. The Ohio Copper Mining Co., which is still regarded as a Heinze concern, shows by its report covering operations from August 1 to December 31, 1912, a profit of $104,953 and $57,031 carried forward to surplus. Ohio Copper has been one of the weak spots in the share list, and its progress is as yet no great matter of satisfaction to the holders. As a step in the final winding up of the affairs of the Development Company of America, the Equitable Trust Co. of New York will, on April 17, sell 400,000 shares of Tombstone Consolidated, 135,000 shares of Poland Mining, 500,000 shares of the Congress Consolidated Mines Co., 250,000 shares of Imperial Copper, and certificates of indebtedness issued by the Poland Mining Co. to the amount of $211,340. It would be difficult to find a series of enterprises having a more hearty support from the best classes of investors than was accorded to the Development Company of America and its subsidiaries. It is not too much to say that the unqualified failure of these companies worked greater harm to mining in creating a hostile attitude on the part of the general public than any number of get-rich-quick schemes such as the one that sent Julian Hawthorne and some of his associates to the Federal prison at Atlanta.

The Phelps-Dodge company's annual report is most interesting, showing as it does a net profit earned of $10,411,535, as compared with $7,283,508 in 1911 and $9,099,910 in 1910. The net profits for the year were equivalent to 23% upon the outstanding stock of the company, which is in round numbers $45,000,000, and dividends paid amounted to 15%. Copper output for the year was 192,297,374 lb., for which the average price received was 15.51c.; of this amount of copper, 52,537,859 lb. was handled on a commission basis, and the balance of 139,759,515 lb. was the product of the company's own properties. John Hays Hammond is apparently about to repeat the experience which he had with Daniel J. Sully, the one-time 'cotton king.' Not long ago Mr. Hammond was made defendant in a suit by Sully, who claimed that his confidence had been abused in some way in the flotation of the General Cotton Securities Co. to the extent of $1,600,000. Now Mr. Hammond, with the other members of the board of directors in the International Petroleum Co., is made a defendant in a suit brought by a Mr. Bushnell, who claims that stock in the company to the amount of $1,420,000 was voted to Mr. Hammond by a board of directors wholly under Mr. Hammond's control. Mr. Hammond's version of the matter, so far as it has been made public, is briefly to the effect that the company is largely indebted to him for loans advanced to save options that were expiring, and that when the company was unable to return the money advanced, the stock in dispute was voted to Mr. Hammond by the unanimous action of the shareholders.

MELBOURNE, AUSTRALIA

NEW SOUTH WALES MINING IN 1912.—THE ARDLETHAN FIELD.—DEATH OF A HERO.—CHANGES AT MT. LYELL.

The preliminary statement of the mineral production of New South Wales in the year 1912 is of a most satisfactory character. The value of the output is officially set down at £11,641,435, or say $56,772,000, the largest yet recorded in the state, beating the 1907 record by some $5,187,000. The chief causes are the high prices ruling for metals throughout the year, the unusual absence of labor troubles, and the expansion of the coal trade. Outside of gold and copper, the increase is general. The gold yield amounted to 165,295 oz. fine, a decrease of 15,826 oz. on the figure for 1911. The chief field has been Cobar; the chief mine, Mt. Boppy, with, however, a decreased production. The value of the copper output has declined $50,000, or to $2,826,000, despite the enhanced value of the metal and slightly increased output from the Great Cobar, the chief copper producer. The value of the tin output has risen from $1,497,000 the previous year to $1,648,000, a fair percentage of the output coming from dredges. The main feature of the year has been the developments in the Broken Hill field, the result of the operations of the mines there being a record production of silver, lead, and zinc. The value of the zinc production (spelter and concentrate) was $8,610,000, as compared with $6,898,000 the previous year. The export of silver, silver-lead, and concentrate came to a value of $16,971,000, as compared with $11,909,000 the previous year and $19,091,000 in the record year (1907). Adding the value of the lead (pig and matte) to the silver, silver-lead, and zinc values already given, a total is obtained of $26,871,000, as compared with $19,830,000 in 1911, and a previous record of $23,531,000 in 1907; these amounts being, it is to be noted, in every case net values and not the value of the finished products. The coal hoisted during 1912 totaled 9,885,815 long tons, valued at $17,842,000, surpassing the previous year's record figures by 738,790 tons and $1,497,000. The coke production, on the other hand, fell away 23,528 tons, to 241,159 tons, valued at $792,000, a decline of $107,000.

There has been a tremendous amount of booming of the new tinfield at Ardlethan (New South Wales). The field, which came into notice a little less than twelve months ago, is distant some 250 miles from Sydney in a southwesterly direction, although by rail it takes 337 miles to cover the distance. By interesting contrast with all the gush that has been written about this area, a contributor to the *Australian Mining Standard* gives it a vigorous roasting. He has no praise for any property but the Carpathia, which has been floated in a public company of 120,000 shares of 10s., half paid. He describes the orebody in this property as 12 or 15 ft. wide and approximately 40 or 50 ft. long. The gangue is kaolin and kaolinized granite. It is plainly a lens or pipe of the larger size. Fine tin is well distributed through the earthy ore, and the showing is certainly most promising. Concerning the other outcrops, he says roundly that some of them contain no tin, that many of the supposed lodes are purely imaginary, that the pipes are generally small, and that the value of the ore-heaps is, in many cases, overrated.

It is not out of place even in a technical journal to devote a few lines of space to the death of a mining hero such as Albert Gadd. On the occasion of the disastrous fire in the Mt. Lyell mine last October, Gadd, who was a working miner, was on duty below. Though he escaped, he reëntered the mine again and again to endeavor to save his mates, with the result that he inhaled so much of the carbon monoxide gas that he was never afterward

fit for anything, and a few days ago he died in St. Margaret's hospital, Launceston. His name is worthy of being held in honorable remembrance. There are changes at the Mt. Lyell mine. The general manager, Robert C. Sticht, is about to take up his permanent residence in Melbourne, whence he will be better able to exercise control over the various operations of the company in the different states. The new local superintendent is B. Sawyer, formerly of the New South Wales Mines Department. Al L. Dean, the company's metallurgist, has resigned his position, and in some three or four months time will return to Canada, whence he came seven or eight years ago.

JOHANNESBURG, TRANSVAAL

STAFF CHANGES UNPROFITABLE.—JANUARY PRODUCTION.—IDLE STAMPS.—TUBE-MILL RATIO.

One great cause of uneasiness on the Rand is the manner in which frequent changes of administrative staffs are made, without adequate notice, and, it is to be feared in a good many instances, without adequate reason. Two years ago one of the principal groups considered the cost of administration too high and dispensed with several of the highly paid advisers. At the end of the first year it was discovered that the new administration had increased the cost something like £20,000, and about 30 subordinates were dropped. This year another 20, including one of the chief and most experienced engineers, have been dispensed with, much to the surprise of the rest of the staff, who, however, have been officially informed that no further changes in the subordinate members are contemplated. It is, however, freely rumored that a well known American consulting engineer is expected to return to the services of this particular group shortly, which, if true, will probably lead to many other changes. Not only do these frequent disturbances tend to reduce the efficiency of the administration, but sometimes a change is made in order to modify the whole system and principle of working, and a further shake-up follows before the last appointee has been able to get the new ideas and methods into full operation.

According to the Transvaal Chamber of Mines, the declared output of gold for January was another record, the total amount being 789,390 oz., value £3,353,116, being an increase of 12,984 oz. as compared with December, value £55,154, and record by no less than £41,322, the previous highest normal month being May, with a value of £3,311,794. The increase for January would have been larger had not the outside districts shown a decline of 3137 oz., value of £9073. The Rand output was 760,981 oz., value £3,232,440, the previous highest Rand output obtained under normal circumstances being May 1912, with 746,948 oz., value £3,172,833, an increase of 14,033 oz., value £59,507. The total output from the outside districts was 28,409 oz., value £120,676, as against 32,714 oz., value £138,961, contributed toward the previous record output.

Among the more conspicuous increases on the Rand may be mentioned Crown Mines, with an increase of £21,226; East Rand Proprietary Mines, £16,553; Nourse Mines, £9821; Consolidated Langlaagte, £6397; Geldenhuis Deep, £5798; Simmer Deep, £4864; and Randfontein, £4766. The largest producers were: Crown Mines, £298,874; Randfontein Central, £273,741; East Rand Proprietary mines, £263,066. The total number of stamps at work in the Transvaal in January is given at 10,009, an increase of three only on the previous month, but on the Rand the number was 9540, an increase of 100. In the outside district the total number of stamps at work is given as 469, a decrease of 97. The Rand output for January was indeed a good showing, but with a better supply of labor available few months should be allowed to elapse without another record output being obtained.

At the end of January over 1100 stamps for various reasons were hung up, but few for reasons likely to prolong or perpetuate their idleness. The Randfontein Central has the largest number—250—idle, but these are expected to be in full swing ere many months are past. The Crown Mines, too, have no less than 175, caused by the concentration of mining and milling operations, and their replacement by a heavier type of stamp while Lancaster West has closed and thrown its mills idle. Then there is the Robinson Deep, where a new milling policy is being introduced of increasing the number of tube-mills and reducing the stamps, with the result that instead of 200 stamps running, as was the case a year ago, today there are only 160 stamps, while the tube-mills have been increased from 5 to 10. Then, again, the new mill at the Roodepoort United Main Reef has proved so efficient and difficult to keep fully supplied with ore that up to the present it has only been necessary to have half the stamps at work, with the result that 50 are idle. Another new producer, the City Deep, had 44 stamps idle, but these will soon be fully employed. Princess Estate, too, has 50 idle stamps, while Main Reef West and the Consolidated Main Reef had each 30 stamps idle. Both these concerns ought to be soon in a position to find employment for these idle stamps, but there are poor prospects of the idle 55 stamps at the Jumpers starting, as the property is fast approaching exhaustion. Other mines have from 10 to 20 stamps idle, but it will be seen that even though the January output constitutes a record, there is still sufficient milling capacity on the Rand in reserve to enable the output to continue progressing. To what extent these idle stamps on the Rand are due to the introduction of tube-mills it is impossible to say, but it is certain that the 9540 stamps, if full credit be taken for the duties performed by the 280 tube-mills, must be equal to at least 15,000 stamps of the kind in vogue some years ago. Taken altogether, therefore, what with the idle stamps and the prospects of new producers, the Rand for many years to come ought to produce a few more record outputs.

ST. PETERSBURG, RUSSIA

RUSSIAN RECORD COPPER PRODUCTION IN 1912

In the year 1912 the production of metallic copper in Russia reached the record figure of 2,048,233 poods.* This compares with 1,571,879 p. produced in the year 1911; so that if we take into account the importation of copper into Russia during 1911, namely, 477,000 p., we find the consumption of copper for that year in the country to have been about 1,995,000 p. Therefore, taking 1911 as a basis, the year 1912 has more than supplied the needs of the country in copper. Notwithstanding this fact, during the year copper was imported to a considerable extent, namely, 419,000 p. That is to say, consumption has kept well ahead of the production, which had already increased over the preceding year by 31.3%. The occasion of the annual statement may be taken to refer again to the relative importance of the various copper-producing districts and their relation to their respective productions in 1911, which was as follows: Urals, 1,103,000 p. in 1912, as against 809,000 p. in 1911; Caucasus, 576,000 p. against 477,000 p.; Altai, unknown for 1912; Siberia, 294,000 p. against 228,000; chemical works and refineries, 75,000 p. against 56,000 p. Thus the Urals, all the way through, have maintained not only their lead, but the increased ratio of lead which had been the feature of the production there throughout the year, due mainly, of course, to the intense activity of the Kyshtim works, where the production for the year amounted to 467,000 p. against 241,000 p. in the year 1911. The Upper Isset plants likewise increased considerably, from 80,000 p. to 108,000 p.; and the Syssertsk from 73,000 to 101,000 p. The Caucasian increase is one of 99,000 p. or 20.6%, and the largest contributor to this satisfactory result was the Caucasian Copper Co., with an increase from 137,000 p. to 190,000 p., followed by the Kunduroff company from 6000 p. to 34,000 p., and so on. The Siberian position shows an increase of 66,000 p. of 28.9%. The largest contributor, accompanied by the most rapidly increasing production, was the Spassky company, whose production increased from 195,000 p. in 1911 to 271,000 p. in 1912, while there was a reduction, as is already known, on the part of the Yenissei company, from 29,000 p. to 18,000 poods.

*The pood equals 36.11 pounds.

General Mining News

ALASKA

Iditarod

During the past season the Guggenheim dredge worked from August 15 to October 29, or 74 days, and handled 172,333 cu. yd. of ground averaging $2.34 per yard, at a cost of 45.9c. per yard. Some of the gravel yielded as high as $8.90 per cubic yard. The hydraulic properties dealt with 2,967,750 cu. yd., producing $629,043, or 21.2c. per yard, at a cost of 9.37c. per yard. Costs were low on account of a favorable season, and less thawing was necessary ahead of the dredges.

Juneau

During February, development at the Ready Bullion and 700-Ft. Claim mines of the Alaska United covered 480 and 66 ft., respectively, the stock of broken ore decreasing 6066 and increasing 238 tons. The two 120-stamp mills crushed 34,254 tons of ore, yielding a total of $83,689 by amalgamation, and treatment of 788 tons of concentrate. Operating expenses totaled $46,471, and construction $1402, the net profit being $35,804.

A large dam is to be constructed on Salmon creek by the Alaska Gastineau Mining Co. It will be arch shaped and will be 160 ft. high in the centre, 500 ft. long at the top, 8 ft. thick at the top, and 53 ft. at the bottom, and will contain 50,000 cu. yd. of masonry. The water impounded will generate 6000 hp., in three units of 2000 hp. each. Preliminary work is now under way.

ARIZONA

Gila County

(Special Correspondence.)—At the Inspiration Consolidated, a large number of miners were laid off on March 22, as underground development, which has been progressing at the rate of almost a mile per month, has become so far advanced over actual mill construction work that it was deemed advisable to temporarily suspend part of the mining operations. The incline through which all the miners reach the Inspiration works, and which for the present has been bottomed at 140 ft. below the 3480-ft. level (sea-level), is eventually to be sunk 270 ft. lower than the deepest workings of the mine. The 180-ton waste-pocket raise that is being driven from a point on the incline to tap the 3480-ft. level is progressing rapidly, due largely to the efficiency of the electric hoist which was recently installed at the incline. A similar hoist was installed at the Scorpion shaft, and the placing of one at the Live Oak shaft No. 1 is almost completed. At the main east and west shafts, the foundation for the 3000-cu. ft. per minute, electric driven, Nordberg air-compressor is completed. The railroad construction is fast nearing completion. The grading for the Live Oak branch is finished and the track is being laid at a rapid rate, at present having reached a point opposite the portal of the Joe Bush adit. The spur to the warehouse at the mouth of the adit should reach there this week, and will eliminate an immense amount of team haulage now required. At the Inspiration branch, only one large cut remains to be completed. Two Bucyrus steam-shovels are at work, and the construction will probably be finished by the end of April. All work at the Inspiration division will receive an added impetus on the arrival of the railroad. Construction at the mill is limited to the building of the three railroad spurs which encircle the site. The experimental plant, the operation of which was recently resumed, for the purpose of testing the efficiency of the Elmore flotation process on the Inspiration low-grade ore, is still running. It is reported to be proving successful. Ten additional adobe bungalows have been completed by the company for the use of employees. They are on the crest of the hill across the canyon from the warehouse at the Joe Bush adit. Five bungalows and the residence for H. Kenyon Burch are being constructed near the millsite by the company.

At Miami the tram system leading from the power-house to the mill is being reconstructed so as to handle all freight and timber at the lowest cost. The new change-room, which is situated about 150 ft. east of No. 4 shaft, is nearing completion. It is a two-story, steel, reinforced-concrete structure, 50 by 90 ft., and will contain 823 steel lockers, 100 shower baths, and steam heat. Especial attention has been given to the ventilation, which is a necessary requisite, of which the average change-room is devoid. When finished it will be the best-equipped change-room in the Southwest.

At the Black Warrior it is reported that the present management is contemplating the sinking of the shaft to a greater depth. Two shifts, totaling 65 men, are employed, and about 100 tons of ore per day is being shipped to the El Paso smelter.

Miami, March 27.

At the Old Dominion smelter power-plant, foundations have been laid for another large air-compressor, which will be erected in about 60 days. At the Miami, a fire service is being installed to cover about 30 acres of the property, a head of 100 ft. being maintained. At the Inspiration millsite, three sections have been graded, and the work has been suspended awaiting the completion of the railway, when construction material can be delivered. On No. 7 level of the Arizona Commercial mine at Copper Hill, a drift has cut a shoot of good sulphide ore.

Yavapai County

Reports from Turkey creek district indicate that the mining industry is prospering. The mill at Pickaway is crushing ore from the Silver Chord mine. Work has been resumed at the Great Republic. The Cash mine is to be developed on an extended scale. The Binghampton mine, situated on the Agua Fria river, is to resume operations. Electric drills are to be installed at the claims of the New Mexico Lead & Copper Co. On the 1200-ft. level of the Arkansas & Arizona mine, rich sulphide ore was cut, and a winze sunk 200 ft. has opened a considerable quantity of ore. Three new boilers and a large hoist have been ordered. It is said that a large vein has been opened in the claims owned by J. N. Duncan at Mt. Union.

CALIFORNIA

Butte County

Extensive development is to be done by the Ophir Dredging Co. near Oroville, and a well will be dug to get water on the land owned by the company. R. E. Gruber is superintendent. It is reported that the Mammoth Channel mine will be actively worked in a few weeks. A drainage adit three miles long will be started near the old Ethel mine to cut the Mammoth adit at a point 2½ miles from Magalia. This drainage adit will reduce expenses a good deal, as it will not be necessary to work the two large pumps installed. At the Gold Brick mine, Forbestown, machine-drills will be in operation in a few days. The Crystal Hill will resume work in a week or so, the old machinery which was damaged by fire having been replaced by new installations, electrically driven, power supplied by the Pacific Gas & Electric Company.

Eldorado County

Preparations are being made to clean out the old shaft of the Inter-valley mine, near Rescue. Bruce McBeath is superintendent.

The Oro Fino, or Big Canyon mine, situated three miles south of Shingle Springs, which has been unworked for 12 years, has been acquired by English capitalists. The incline shaft was sunk nearly 600 ft., and is to be unwatered. It is said that there is a large low-grade and highly mineralized orebody in the mine.

Nevada County

The Erie mine, near Graniteville, one of the largest properties in the Eureka district, has been bonded by the Eastern company owning the holdings of the Erie Exploration Co. The mine will be thoroughly developed, E. L. S. Wrampelmeier being in charge. A cross-cut from the main adit of the South Yuba mine, near French Corrall, has passed through 30 in. of ore containing gold, silver, and

copper. Native silver shows in the ore. C. D. Tregoning is in charge.

SHASTA COUNTY

A 2-stamp mill is being erected at the Highland mine, French Gulch, which has been idle for several years. O. B. Hardy recently bonded the property from M. H. Peck. Good ore has been opened, and it is proposed to drive an adit about 6000 ft. Twelve men are employed at present.

SIERRA COUNTY

Early in April the 20-stamp mill of the King Solomon mine, below Alleghany, will be started. This property is owned by the Oasis Gold Mining & Milling Co., of which R. L. Polk, of Detroit, is the principal holder. It was abandoned until about a year ago, and since then development has proved an ore-shoot 4 to 16 ft. wide. W. J. Seymour, alone, has driven an adit 600 ft., at an expense of $9000, in the Rosanne mine near Alleghany, and has cut a vein of heavily mineralized ore. The El Dorado quartz mine has been leased, and the mill is crushing good

SLUICE-BOXES, LAGRANGE MINE, TRINITY COUNTY.

ore. More men will be employed at the Sixteen-to-One mine. The Bernhardt Bros. have 1100 loads of gravel ready to be washed at the Hilo. An option has been taken at the Mexican quartz property, on the South Fork. Necessary repairs are being made to the Gold Bluff-North Fork ditch and flume. It is said that a large air-compressor and 10 stamps will be installed at the Tightner. The monthly output of the mine is approximately $85,000. The vein is pitching toward the Red Star claim, owned by the Tightner company, and an adit is being extended into this ground. Repairs to the compressor at the Chips mine, above Sierra City, have been completed, and the mill will resume work. The Wide Awake mine has been bonded to Jason Frye, Sr. The Gold Canyon and Kenton will start crushing ore in a few days. Generally speaking, a good deal of work is projected in the Alleghany district.

SISKIYOU COUNTY

A small stamp-mill is to be erected by W. Blagrave on his mine on the Trinity-Siskiyou divide, near the headwaters of the Trinity river. The owner recently found rich ore in a pocket, and has since opened a vein.

TRINITY COUNTY

Eighty tons of steel rails, cut into 4-ft. lengths, are being hauled by teams from Redding, Shasta county, to Weaverville, a distance of about 65 miles, to the Lagrange gravel mine. These rails are to be used as riffles in the sluice-boxes.

The Guggenheim interests have bonded all the mining ground between Trinity Center and Carrville, a distance of four miles, the option lasting three months. It embraces the Alta Bert Mining Co.'s property and dredge, the McDonald, Mrs. Carr's claims, and the Headlight company's claims along the river. About 50 men will be employed in prospecting with drills and in sinking shafts. The Democrat mine is situated in Democrat gulch, Weaverville, and an adit has been driven 160 ft., at a depth of 300 to 350 ft. from the outcrop of a vein, and at 100 ft. in the adit good ore was cut. A winze has been sunk 20 ft., showing two to five feet of rich ore, and will be sunk to 100-ft. depth.

COLORADO

DOLORES COUNTY

The mill of the Rico-Wellington company is doing good work. Copper ores are shipped, while the lead and zinc concentrate produced averages 60% and 45%, respectively.

EAGLE COUNTY

The state commissioner of mines, T. R. Henahen, has returned from his second visit to the Brush creek district and states that prospecting has opened more rich silver ore, and native silver is seen in the sandstone. There has been a rush to Eagle, but the snow is still too deep for prospecting. Mr. Curley, mine inspector, has also visited the district, and stated that in the discovery adit there is 8 ft. of ore in sight, and in the lower adit, 100 ft. below the former, 5 ft. of ore has been opened, all carrying from 200 to 600 oz. silver per ton.

GILPIN COUNTY

According to the annual report of the Frontenac Consolidated Mines, Ltd., 30,719 tons of ore, worth $8.42 per ton, was treated. Ore in sight is estimated to keep the mill at work for three years, treating 250 tons per day, with a monthly profit of $21,000. Two lots of ore shipped from the Castle Rock mine has yielded 2.05 and 5.12 oz. gold, 17 and 19.68 oz. silver per ton, and 6.2 and 25.5% lead, respectively.

OURAY COUNTY

The Humboldt company will erect a 100-ton mill in the spring. J. W. Hutchinson, of Goldfield, has designed the plant, which will include a crusher, rolls, Hardinge and tube-mills, concentrators, and cyanide equipment.

A meeting was held at Ouray on March 17 to deal with the silting up of the Uncompahgre river by the mills of the district, farmers in the lower country stating that damage was being done. The mining companies were asked to impound as much tailing as possible. The industry has paid 59.6% of the taxes of the county during the past nine years, and agriculture only 10.5%. A general discussion followed the meeting, and committees from both parties are to meet again.

SAN JUAN COUNTY

About the middle of March the Allerton Mining & Milling Co., which operates the Joe & John property at Cement creek, opened silver and copper ore worth $50 per ton in an adit in 1750 ft., and at a depth of 600 ft. below the upper workings. This company is interested in the new mill to be erected at the North Star.

SAN MIGUEL COUNTY

A snowslide rushing down the Nellie property has carried away part of the mill and demolished the transformer-house. Building of the concentrate-treatment plant at the Liberty Bell mill is progressing well. This will do away with the cost of shipment to smelters. Bad roads have prevented shipments of vanadium ore lately, but the Colorado Carnotite Co. is preparing two carloads.

TELLER COUNTY (CRIPPLE CREEK)

Three Card and one Wilfley tables have been placed in

the Colburn mill at the Ajax mine, where the Clancy electro-chemical process is used. The Blue Flag mill on Raven hill will shortly be started, and continuous decantation will be used in the cyanide department. An orebody has been opened for 40 ft. on No. 16 level of the American Eagles mine, Bull hill, and shipments have returned $110 per ton. Block 239 of the Stratton estate is producing two cars of ore per week from the 260-ft. level. Ten to twelve inches of good ore has been cut in the south section of the 1600-ft. level of the Vindicator mine. Air pumps are lifting 200 gal. of water per minute from the 1600 to the 1500-ft. level, from where it is run to the Golden Cycle shaft and raised to the surface by electric pumps operated jointly by the two companies. The Portland company is sinking No. 2 shaft from the 1600-ft. level. A 75-ton mill to treat low-grade ore will be erected by the Free Coinage Gold Mining Company.

The Work Mining & Milling Co. has been denied a new trial with the Doctor-Jack Pot Mining Co., the latter having been awarded $432,000 for ore wrongfully extracted. The flow of water from the Roosevelt drainage tunnel has increased to 8500 gal. per minute, on account of melting snows. On March 28 two 'high-graders' were captured on the 1500-ft. level of the American Eagles mine, after about 50 shots had been exchanged. The men were fully equipped for stealing the rich ore, and other emergencies.

IDAHO

Shoshone County

On April 4 the Bunker Hill & Sullivan Mining & Concentrating Co. paid dividend No. 187, amounting to $65,000, making the total to date $14,173,350.

MICHIGAN

Houghton County

(Special Correspondence.)—Mine rescue car No. 8, of the United States Bureau of Mines, will visit the following mines between March 31 and April 20: Florence Iron Co., Reserve Mining Co., Penn Iron Mining Co., Loretto, Arago, Chapin, Pewabic, and Traders. In all, 43 men are to be trained at these mines. The car is at all times connected by telephone with the copper and iron mines of the Upper Peninsula of Michigan.

Pittsburg, March 20.

During 1912 the Mohawk Mining Co. mined 868,641 tons of 'rock,' sorted out 80,700 tons, equal to 9.29%, and stamped 787,941 tons, yielding 15,901,500 lb. of 'mineral,' containing 11,995,598 lb. of refined copper, as against 15,013,500 lb. in 1911. The average price received was 16.08c., as against 12.63c. per pound in the previous year. Receipts totaled $1,929,428, and expenses $1,264,187, leaving a profit of $665,250. Dividends amounted to $350,000, and the surplus is $897,316.

LAKE SUPERIOR COPPER DISTRICT.

The Ahmeek mill is being enlarged and remodeled, and will contain more regrinding machines than any plant in the district excepting that of the Calumet & Hecla. At the Quincy mill, one unit of a new system of Symons rolls, hydraulic classifiers, and jigs are to be installed, to reduce all the oversize from the stamp-mill and deliver a better product to the following machines. A centrifugal pump of 20,000,000 gal. daily capacity has been installed as a duplicate, in case of emergency.

The Quincy Mining Co. did 2734 ft. of diamond-drilling and 31,405 ft. of development during 1912, and sent 1,309,253 tons of 'rock' to the stamp-mills. At No. 2 shaft ore was mined from an average incline depth of 4360 ft., and at No. 8 from 3870 ft. No great change has been noted in the copper content of the rock in the new lower or bottom openings, though the section north of No. 8 shaft is showing good ore. The yield of refined copper was 20,634,800 lb., worth $3,351,360. Mining, smelting, taxes, and general expenses totaled $2,291,913, leaving a profit of $1,089,674. Dividends paid amounted to $550,000, and the surplus is $1,393,278.

MINNESOTA

St. Louis County

The Pittsburg Iron Ore Co., at Virginia, will install a 500-kw. Curtis turbo-generator and switchboard at its mines at Iron Mountain. The unit will be of the General Electric Co.'s manufacture.

MONTANA

Silverbow County

(Special Correspondence.)—Samuel McConnell, superintendent of the Butte Central, is authority for the statement that, from the present mine run of ore the company is earning a good profit, but the company has been rather slow in transferring funds from Boston to Butte for operating expenses, and this has hampered work somewhat up to the present time; but when the returns come in from the shipments of concentrate, financial problems, it is promised, will be solved for good. The mill is handling at present 100 tons of ore per day, and the concentrate contains an average of 80 oz. of silver, $7 in gold, and 7½% of lead. About 30% of the metals in the ore are saved by concentration and the balance in the cyanide department. As the lead is lost by sending concentrate to the Washoe smelter at Anaconda, it will hereafter be shipped to Utah. Mining is being done on the 200, 300, 400, and 500-ft. levels.

Butte, March 30.

(Special Correspondence.)—The new management of the Davis-Daly Copper Co. states that ore is being found beyond the faults, and it is to be hoped that something good is in sight for the long-suffering shareholders. The shaft of the Butte & Zenith Mining Co., in the extreme western part of the district, is down 350 ft., and sinking is being done at the rate of 100 ft. per month. If ore is opened in this property a revival of the western end of the district may be expected. In February the copper-mining companies of Butte again paid their miners 25c. more per shift than their contracts call for. The average price of copper was below 15c. per pound, but the miners were paid $3.75 per shift instead of $3.50 as per contract. The Tuolumne Copper Co. has elected the following officers for the ensuing year: Edward Hickey, president; Ray J. McDonald, vice-president; and J. W. Pratt, second vice-president. These, with Daniel Shields, Charles R. Leonard, N. J. Bielenberg, and T. E. Murray, constitute the board of

directors. During 1912 the company mined 47,000 tons of ore at a net profit of $9 per ton. A saving in power-costs of nearly $3,000,000 per year is credited by the Anaconda Copper Mining Co. to its electric power equipment, supplanting the more expensive steam power. This saving is not manifested in greater dividend rate, but in the handling of lower grades of ore, thus prolonging the life of the mines. The Neversweat mine will be closed for six months while the shaft is being retimbered and a new head-frame erected. The shaft of the Rainbow Lode Development Co. is down 225 ft. It will be continued to the 800-ft. level before any lateral work is attempted.

Butte, March 22.

On the 1400-ft. level of the Davis-Daly, a cross-cut 86 ft. in length, driven from a drift 500 ft. long, has opened 12 ft. of high-grade copper ore, bornite being much in evidence. The shoot can be reached from eight different points on the level. On the 1900-ft. level, 2 ft. of copper glance also cut shows another 12 in. of poorer ore.

The Bullwhacker mill is to be enlarged to treat 100 tons of ore per day, and supplies have been ordered for an output of 8000 lb. of electrolytic copper per day.

NEVADA

Lincoln County

During March the Prince Consolidated mine at Pioche sent out about 3500 tons of ore and a large tonnage of tailing from Bullionville. Diamond-drilling is being done at the Prince Extension. A carload of ore from the Boston & Pioche averaged 40% lead, 132 oz. of silver, and $4 in gold per ton. The 300, 400, and 450-ft. levels of the Gipsy mine, of the Bristol Consolidated company, have opened good lead, copper, and silver ore. On the 500-ft. level a cross-cut is being driven to get under this ore.

Lyon County

On the No. 7 level of the Ludwig section of the Nevada-Douglas, the winze at the south end is producing 15% copper ore. A shoot of carbonate ore has been opened on No. 4 level, and yields 25 to 30 tons of 6% ore per day. A raise is being driven on 18 in. of carbonate ore on No. 2 level. Work in the Douglas Hill section shows no important changes.

The third annual report of the Mason Valley Mines Co. shows that a net profit of $226,897 was made. At the mines, the ore-shoots have been developed, showing continuous ore for 800 to 900 ft. in length. Limestone has been opened for fluxing purposes. Diamond-drilling covered 2216 ft. and development 1391 ft. The smelter, which was described by T. T. Read in the *Mining and Scientific Press* of August 31, 1912, was started in January 1912, and dealt with 98,912 tons of Mason Valley ore, 142,910 tons of custom ore from Nevada and California, and 15,768 tons of limestone, producing 16,580,493 lb. of copper, 917 oz. of gold, and 49,318 oz. of silver.

Nye County

The Tonopah mines produced 10,998 tons, valued at $237,380, during the week ended March 29. The main cross-cut on No. 8 level of the West End has proved the vein to be 8 ft. wide, of low-grade ore. On the 515-ft. level of the Montana, 400 ft. northwest of the shaft, a raise of 20 ft. has cut 3 to 5 ft. of heavy sulphide ore assaying $137 per ton. The north cross-cut on the 1070-ft. level of the Merger has cut 4 ft. of ore, in trachyte formation. On the hanging wall is 10 to 14 in. of ore assaying $15 to $40 per ton. A new 150-hp. motor has been installed at the MacNamara hoist, and the 10-stamp mill is treating 83 tons per day. At the Buckeye-Belmont, a new electric-hoist motor, capable of hoisting a 2-ton skip at 700 ft. per minute, is being installed. An ore-bin will be erected near the shaft.

At Manhattan the White Caps lease is shipping ore through the Western Ore Purchasing Co. to Salt Lake smelters. This ore is worth $30 to $300 per ton, and contains antimony and arsenic, and is not amenable to ordinary treatment.

White Pine County

At the pit at Copper Flat, water from the Ely Consolidated is being used by the Nevada Consolidated. At the Liberty pit, one steam-shovel is working in ore and another in overburden. At the mill, the riffles on the Wilfley tables are being altered. A test is being made with an Isbell vanner on coarse tailing. The slime-settling plant is being increased by 16 Dorr thickeners, while at the east end of the mill there will be eight more thickeners, 8 by 20 ft., installed. Forced draft is being used in the roasting furnaces, resulting in an increase of 50% in capacity. There have also been alterations in the handling of converter slag, which is moved by an oil-fired locomotive. An interesting test will be proved by the use of oil from California and coal from Utah in locomotives about the plant. The February copper production of the Nevada Consolidated Copper Co. was 4,798,537 lb., as against 4,169,708 lb. in January and 4,888,790 lb. in February of 1912.

CANADA

British Columbia

The ninth annual report of the International Coal & Coke Co. states that 520 men are employed, and the net profit for 1912 was $232,198, of which $132,198 was transferred to the surplus account and the balance carried forward to the working and dividend fund for 1913. On March 26, 3.5 ft. of silver ore was cut at a depth of 700 ft., and in about 1000 ft., in the adit of the Utica mine at Kaslo.

Ontario

During the week ended March 22, seven Cobalt mines shipped 406 tons of ore, and five shipped 99,492 oz. of bullion, making the total from the district for the year 4678 tons and 1,577,793 ounces.

On the 575-ft. level of the Timiskaming mine, the drift has been driven in ore for over 60 ft. This is in diabase, and about 70 ft. below the contact with the Keewatin. High-grade ore has been opened in No. 8 vein of the Lawson. On the 300-ft. level of this mine, several hundred tons of rock fell on March 24, killing an Austrian.

At Porcupine the McIntyre mill is treating 150 tons per day, this being its full capacity. Twenty men are working at the Jupiter, the principal work being driving on the 200-ft. level and raising from the 300 to the 200-ft. level. On No. 3 vein of the Foster Oaves, a depth of 50 ft. has been reached. The mill is being erected as quickly as possible.

At Swastika the Burnside property has been sold to W. L. Foley for $250,000, with an initial payment of $5000. Although little work has been done on the property, it is said to be one of the most important in the Kirkland Lake district.

Yukon

The Yukon Gold Co. has started work for the coming season, and about 100 men are employed in the machine-shops and general work. The transformer stations in Bonanza valley will be moved up the hills, so as to be clear of hydraulic work. Since the company's powder-house was robbed of dynamite, it is being guarded by armed watchmen. Owing to the continued mild weather, an early break-up of the ice is expected. A new copper vein has been cut at 200-ft. depth in the Valerie property of the Atlas Mining Co. at Whitehorse.

MEXICO

Jalisco

A rich shoot of ore about 5 ft. wide has been opened in the Animas mine, owned by the Amajac Mines Co., in the Hostotipaquillo district. Supplies and machinery for the new 50-ton cyanide plant are being assembled. W. J. Pentland is general manager. The new mill for the Cinco mines has been ordered, and will consist of 30 stamps, 5 tube-mills, concentrators, and cyanide plant of 250 to 300 tons capacity. H. E. Crawford is manager. The Mezquital Mining Co. has completed experimenting on its ores, and the results show that a good recovery can be made by leaching and decantation. M. J. Slattery has gone to inspect mills in the United States and will order the new plant required.

Company Reports

GOLDFIELD CONSOLIDATED MINES COMPANY

According to the report of Albert Burch, the new general manager of the company, during the month of February 1913, the total production of this company was 26,711 tons, containing $567,356, or an average of $21.24 per ton, of which 24,840 tons was milled with an average extraction of 93.17%, and 1871 tons was shipped, of an average value of $20.93 per ton, the net recovery from all ore being $19.89 per ton. The net realization was $348,853, equal to $13.06 per ton. Development work covered 2757 ft. during the month. In the Combination section of the mine, a diamond-drill was started from a station about 350 ft. east of the shaft on the 380-ft. level, and a hole was drilled southeasterly at an angle of 48° to cut the downward extension of the Reilly shoot. The 448 cross-cut in the Mohawk, in the foot-wall of 490-R stope, cut the downward extension of the same shoot, and produced 53 tons of ore averaging $20 per ton. No. 303-M raise, in the Laguna, has cut 6 ft. of $17 ore. This new orebody has been opened by raises for 100 ft. on its dip. In the Clermont-Jumbo, the 420 stope, 700 ft. south of the shaft, has produced a large tonnage of ore averaging $36.63 per ton. The 604-W stope, on 534 orebody, produced 431 tons of $51.70 ore; while No. 802 yielded 483 tons of $50 shipping ore. Prospecting for the downward extension of the 802 shoot continues on the 1400-ft. level.

Costs for February were as follows:

Mining, including stoping and development)	$3.23
Transportation	0.08
Milling	2.01
Marketing	0.08
General expense	0.38
Bullion tax	0.15
Construction	0.30
Marketing ore	0.80
Total cost of operation	$7.03
Miscellaneous earnings	0.04
Net cost per ton	$6.99

DALY WEST MINING COMPANY

The annual report of the Daly West Mining Co. shows that mining work covered 7131 ft. On the 1700-ft. level an orebody has been opened 100 ft., and upward 125 ft. Considering the small amount of work done on the 1900, 2000, and 2100-ft. levels, a good deal of ore has been produced. The 900-ft. level will be prospected during the current year. Owing to the water-supply being frozen part of January to May, the mill only worked 201½ eight-hour shift. Production was as follows:

Crude ore sold, tons	17,497
Yield from ore:	
Copper, pounds	552,692
Lead, pounds	6,151,286
Gold, ounces	569
Silver, ounces	756,602
Value received	$303,230
Concentrate produced at mill, tons	7,245
Contents of concentrate:	
Copper, pounds	159,002
Lead, pounds	4,468,419
Gold, ounces	259
Silver, ounces	249,614
Value received	$252,558
Zinc concentrate produced, tons	1,465
Contents of concentrate:	
Zinc, pounds	1,004,554
Lead, pounds	182,209
Silver, ounces	30,211
Value received	$32,172
Total value received	$587,961
Dividends paid	$216,000
Total production to date	$15,058,186
Total dividends to date	$6,579,000
Cash on hand	$109,868

Merton's Copper Statistics

European statistics of copper stocks as of March 15 are given by Henry R. Merton & Co., Ltd., as below:

Stocks in England and France:	Long tons.
Liverpool and Swansea, Chile bars and ingots	3,150
Liverpool, Swansea, and Port Talbot, English standard copper	13,277
Liverpool and Swansea, other standard copper	2,249
London, Newcastle-on-Tyne, and Birmingham	3,199
Total standard copper	21,875
Liverpool and Swansea, furnace material (fine)	1,130
Havre, stocks fine copper	3,857
	26,862
Afloat from Chile (fine)	2,775
Afloat from Australia (fine)	4,500
	34,137
Rotterdam stocks (fine)	4,950
Hamburg stocks (fine)	4,552
Total visible supply in Europe	43,639

Settlement prices for copper recently were as follows: February 15, £65 15s.; February 28, £64 15s.; March 15, £64 12½s.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

W. J. Lorino is in Western Australia.

E. L. Oliver is back from New York.

C. C. Broadwater is returning from New York.

J. A. Holmes is expected in San Francisco May 1.

Charles E. van Barneveld will remove to San Francisco May 1.

Silas Wright is leaving Medellin, Colombia, for a journey of observation.

H. E. West has left London for India in employ of John Taylor & Sons.

J. E. Clennell has come up from Pachuca and is now at Oakland, California.

R. T. Mason has left Salt Lake City and will be at Los Angeles for the present.

Y. Tsuboi is back at Kosaka after a trip through the United States and Europe.

W. J. Rickell has gone to Knik, Alaska, to manage the Free Gold Mining Co.'s property.

T. A. Rickard has been elected corresponding member of the Canadian Mining Institute.

W. H. Shockley expects to be at Palo Alto, California, for some time after the middle of April.

L. H. Barkdoll succeeds George Kingdon as superintendent for the Old Dominion Copper Company.

F. Lynwood Garrison has had a touch of fever at Caceras, Colombia, but recovered nicely. He will be home in May.

Albert Burch, W. A. Bradley, Fred J. Siebert, John G. Kirchen, Frederick Bradshaw, W. H. Blackburn, and W. B. Alexander, form the executive committee of the newly formed Nevada Mine Owners' Association.

Joseph MacDonald is to be tried at Juneau in May for murder. The case grows out of the killing of N. C. Jones in 1902 in connection with labor troubles. At the time killing in self-defense seemed so clear that Mr. MacDonald was not tried. Why the matter has been brought up now is not clear.

LOCAL METAL PRICES

San Francisco is not a primary market for the common metals except quicksilver. The prices quoted below therefore represent sales of small lots and are not such as an ore-producer could expect to realize. Ore contracts usually call for settlements on the basis of Eastern prices, less freight and treatment charges. The prices quoted are in cents per pound, except in the case of quicksilver, which is quoted in dollars per flask of 75 pounds.

San Francisco, April 3.

Antimony	12—12½c	Quicksilver (flask)	41
Electrolytic Copper	15¾—16c	Tin	52—53¼c
Pig Lead	4.60—5.55c	Spelter	8—8¼c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES

(By wire from New York.)

NEW YORK, April 2.—Copper prices are firm on account of heavy buying here and in Europe. Lead still remains unchanged. Spelter is easy, floods interfering with consumption. Average daily prices for the past week in cents per pound, based on wholesale transactions, standard brands, are given below.

Date.	Silver, per oz.	Electrolytic Copper.	Lead.	Spelter. St. Louis
Mar. 27	Wires Down	14.65	4.30	5.70
" 28	57¾	14.75	4.30	5.70
" 29	Wires Down	14.80	4.30	5.70
" 30	Sunday.	No market.		
" 31	57¾	14.90	4.30	5.70
April 1	57⅞	15.00	4.30	5.70
" 2	Wires Down	15.08	4.30	5.70

COPPER SURPLUS

Figures showing the visible supply of copper at the beginning of each month are now widely available. Below are given the amounts, in pounds, known to be available at the first of each of certain months.

March	.....	.....	93,412,480

SILVER

Below is given the average New York quotations, in cents per ounce, of fine silver for the months indicated:

	1912.	1913.		1912.	1913.
Jan.	56.25	63.01	July	60.67	....
Feb.	59.06	61.25	Aug.	61.32	....
Mch.	58.37	57.87	Sept.	62.95	....
Apr.	59.20	....	Oct.	63.16	....
May	60.88	....	Nov.	62.73	....
June	61.29	....	Dec.	63.38	....

COPPER

Daily quotations on copper as published in this column represent average wholesale transactions on the New York market and refer to electrolytic copper. Lake copper commands normally from 1-5 to 1-4c. per lb. more. Below are average monthly quotations, in cents per pound:

	1912.	1913.		1912.	1913.
Jan.	14.09	16.54	July	17.19	....
Feb.	14.08	14.93	Aug.	17.49	....
Mch.	14.68	14.72	Sept.	17.56	....
Apr.	15.74	....	Oct.	17.32	....
May	16.03	....	Nov.	17.31	....
June	17.23	....	Dec.	17.37	....

LEAD

Lead is quoted ordinarily in cents per pound or dollars per hundred pounds delivered at St. Louis or New York. Below are the average New York quotations by months:

	1912.	1913.		1912.	1913.
Jan.	4.43	4.28	July	4.71	....
Feb.	4.03	4.33	Aug.	4.54	....
Mch.	4.07	4.32	Sept.	5.00	....
Apr.	4.20	....	Oct.	5.08	....
May	4.20	....	Nov.	4.91	....
June	4.40	....	Dec.	4.20	....

ZINC

Zinc is quoted as spelter, standard Western brands, and based upon St. Louis or New York delivery. While New York quotations, as a matter of convenience, are commonly used, relatively little spelter actually goes to or comes from New York. The bulk is shipped direct from the plants in the Mississippi Valley to manufacturers, due allowance being made for freight. New York daily quotations are published in this column each week. Below are given averages by months:

	1912.	1913.		1912.	1913.
Jan.	6.42	6.88	July	7.12	....
Feb.	6.50	6.13	Aug.	6.96	....
Mch.	6.57	5.94	Sept.	7.45	....
Apr.	6.63	....	Oct.	7.36	....
May	6.68	....	Nov.	7.23	....
June	6.88	....	Dec.	7.09	....

QUICKSILVER

The primary market for quicksilver is San Francisco, California, being the largest producer. The price is fixed in the open market, and, as quoted weekly in this column, is that at which moderate quantities are sold. Buyers by the carload can usually obtain a slight reduction, and those wanting but a flask or two must expect to pay a slightly higher price. Average monthly quotations, in dollars, per flask of 75 lb., are given below:

	1912.	1913.		1912.	1913.
Jan.	43.75	39.37	July	43.00	....
Feb.	46.00	41.00	Aug.	42.50	....
Mch.	46.00	40.20	Sept.	42.12	....
Apr.	42.25	....	Oct.	41.50	....
May	41.75	....	Nov.	41.50	....
June	41.30	....	Dec.	39.75	....

TIN

New York prices control in the American market for tin, since the metal is almost entirely imported. San Francisco quotations average about 5c. per lb. higher. Below are given average monthly New York quotations, in cents per pound:

	1912.	1913.		1912.	1913.
Jan.	42.53	50.45	July	44.25	....
Feb.	42.96	49.07	Aug.	45.80	....
Mch.	42.58	46.95	Sept.	48.64	....
Apr.	43.92	....	Oct.	50.01	....
May	46.05	....	Nov.	49.92	....
June	45.76	....	Dec.	49.80	....

Current Prices for Chemicals

(Corrected monthly by Braun-Knecht-Heimann Co.)

Prices quoted are for ordinary quantities in packages as specified. For round lots lower prices may be expected, while in smaller quantities advanced prices are ordinarily charged. Prices named are subject to fluctuation. Other conditions govern Mexican and foreign business.

Sulphur, powdered, ℔ ton	40.00	45.00
Sulphur, 80%, ℔ ton	16.50	18.50
Talc, prepared, according to quality, ℔ ton	20.00	50.00
Tin ore, 60%, ℔ ton	475.00	500.00
Tungsten ore, 65%	450.00	600.00
Vanadium ore, 15% V_2O_5, ℔ ton	150.00	180.00
Wolframite (see tungsten ore).		
Zinc ore, 50% up, ℔ ton	*15.00	20.00

On Monday, March 3, 1913, the Bunker Hill & Sullivan M. & C. Co. paid dividend No. 186 of $65,400. This makes the total amount of dividends paid $14,107,950.

New York Metal Market Review

The New York metal market, especially as regards copper and tin, was favorably affected by the news that Adrianople, the long-besieged Turkish stronghold, had fallen on March 26 and that better prospects were ahead for Europe. In the month there was one very good movement of buying for export, and one on the part of domestic consumers. Prices varied little. The exports were heavy, although not all for immediate consumption. Lead prices held steadily throughout the month, though prospective tariff changes made final consumers go slow. Prices of spelter advanced, but declined again after a brisk demand had been satisfied. Antimony closed the month lower in price and very dull, a result of overbuying. Aluminum advanced, and its scarcity, especially in sheets, was a cause of distress on the part of manufacturers. Tin dropped a couple of cents in the month, but the downward trend is believed to have ceased, largely because of more strength abroad.

COPPER

The first days of March brought a betterment in market conditions because of an improved demand from abroad, as a result of which copper advanced a few points and on March 3 was quoted at 15c. cash for Lake and 14.87½c. cash, New York, for electrolytic. Most of the selling agencies did a good business on foreign account during this period of activity, but domestic consumers did but little buying. A few days later, however, beginning on March 7 when the February report of the Copper Producers' Association was made public, a good domestic buying movement started, and in the course of a couple of days a large quantity of copper was taken, most of it for fairly early delivery. Prices responded to the awakened demand, and the price of Lake arose to 15.12½c. and that of electrolytic to 15c. As will be at once surmised, the reason for the activity was the showing of a decrease of nearly 900,000 lb. in stocks in the previous month. In this flurry the price of Calumet & Hecla was advanced to 15.25c. cash, and sales made at that figure, but Lake copper was still to be had at the lower price. It was noted that the business done on March 7, and the day after, duplicated the activity of the same time a month before, when there was also good domestic buying, but little for foreign shipment. Tight money conditions abroad were credited with the failure of Europe to buy to a greater extent. A little before the middle of the month dullness set in again and prices dropped to 15c. cash for Lake and 14.87½c. for electrolytic, prices which were quoted to the end of the month and which undoubtedly were shaded. Some strength was added to the market on March 26 by news from abroad that Adrianople had at last fallen. The event was construed as indicating early peace in the Balkans and a restoration of healthier conditions in Europe. London prices, on receipt of the news, advanced 17s. 6d. Despite the better tone of the market, indications were, at the close of the month, that buying would not be resumed in full force until the appearance of the March statement of the producers. The best feature in the latter part of the month was the heavy exports, which totaled 41,702 tons, as against 27,074 a year ago. No one believes, however, that all of the metal exported was for immediate consumption, the general view being that a good part of it went into warehouse to await demand. The average price paid for copper in the Naugatuck valley in the month of February was 15.50 cents.

LEAD

The market was dull throughout March. Demand for certain brands improved a little in the early days of the month and imparted a better tone to the situation generally, but otherwise dullness ruled. Prices, however, stood without change at 4.35c. New York and 4.20c. St. Louis. As previously pointed out, a price-sustaining influence is the narrow difference between production and consumption, but despite this, the holding up of prices is surprising in view of the fact that of all the metals, lead seems most menaced by tariff changes. A reason for the recent dullness is that open weather conditions permitted much outdoor work during the winter months, and a consequent more or less steady consumption of lead which, ordinarily, would not be purchased or used until the usual season for milder weather.

SPELTER

The closing week of March found spelter in the throes of another decline and very dull. At the beginning of March prices were about 6.25c. New York and 6.10c. St. Louis, but the market took an upward turn and 6.40c. New York was reached by March 10, for no other reason, it was reported, than that the advance was agreeable to the interests in whose hands the supply of prompt delivery metal was pretty well centred. At this time it became known that American spelter had been selling abroad at the equivalent of 5.44c. c.i.f. British ports, but this metal had been refined from Mexican ore and therefore had the advantage of a draw-back duty. While the higher price prevailed, there was a good demand, but this was soon satisfied, and then prices receded until in the last week it could be had in carload lots at 5.90c. to 5.95c. St. Louis, and 6.10c. to 6.20c. New York. March 27 it declined to 5.85c. New York and 5.70c. St. Louis. So slow did the demand become that, according to reports from the West, the production of ore was curtailed.

ANTIMONY

Throughout the month the antimony market suffered from the overstocked condition of consumers and not a few dealers. An immense quantity of antimony was contracted for in the buying movement which started last November, and deliveries against these contracts still obstruct new business. Prices have declined and some sellers have declared that they are more inclined to withdraw from the market than to press sales. When March opened, prices were about 9.25c. for Cookson's, 8.62½c. for Hallett's, and 8c. for Chinese and Hungarian grades, while at the close of the month they were 9c. for Cookson's, 8.50c. for Hallett's, and 7.62½c. for Chinese and Hungarian grades.

ALUMINUM

The close of March brought with it slightly higher prices and a firm market for aluminum. Prices in the last week ranged from 26.87½ to 27.12½c. for prompt shipment and 26.62½ to 26.87½c. for future delivery metal, 98 to 99% pure.

TIN

At the first of March tin was selling at 48.50c. New York, and in the last week of the month around 46.50c., but with the prospect of better prices because of the better feeling in London following the fall of Adrianople. Up to March 5 the market was quiet on the surface, but there was a fair business for future delivery. In the following week business in futures continued fair, with prompt-shipment metal in poor demand. At this time, and until the end of the month, tin was selling in New York at below the import price. In London during most of the month the feeling was pessimistic, which led to persistent bear selling by operators. While bearing the market, this selling gives promise of future strength, as there will be a great deal of tin required to cover short interests when contracts become due. Between March 13 and 19 the fair demand for futures continued, and the call for spot was slightly improved. In this week it was noted that there was in New York harbor the largest quantity of Chinese tin ever in that port, two ships having arrived with 320 tons aboard. This metal runs 97 to 99¾% pure, and the high grades are suitable for any purpose for which tin is used. The closing week of the month brought a little action in buying, but not much, although the trade was hopeful and believed that price recessions were about at an end. A feature of the month was the large arrivals, which up to March 27 totaled 5575 tons. Deliveries are estimated at 5000 tons, so that a good initial supply for April stocks is assured. March 26 there was afloat 2180 tons. The lowest price for the month was 45.70c., and the highest 48.50c. At auction sale in Rotterdam on March 27, about 2450 tons of Banca tin brought 131¾ florins, equal to about 48c. c.i.f. New York.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

TELEPHONE connections over the lines of the American Telephone & Telegraph Co. in 1912 totaled 8,472,000,000 calls.

WATER used by the 12 large mines at Kalgoorlie amounted to 36,780,000 gal. in December, an average of 283 gal. per ton treated.

A REGRINDING TESTING plant of one 8-ft. Hardinge mill and four Wilfley tables is being installed at the Mohawk mill, Lake Superior.

ELECTRIC HAULAGE in the Mason Valley mine, Nevada, is done by two 4-ton Jeffrey locomotives, and 42 heavy steel cars of 24-cu. ft. capacity each.

DIAMONDS won in New South Wales in 1911 totaled 5771 carats, valued at $20,000, and since 1867 there have been mined 176,731 carats, worth $570,000.

CONSUMPTION of chemicals at the Standard mill, Bodie, in 1912, was: cyanide, 1 lb. per ton treated; lime, 14.6 lb.; lead acetate, 0.1 lb.; zinc, 0.5 lb.; and tube-mill pebbles, 1 lb. per ton.

OIL consumption at the Copper Queen power-plant at Douglas is 1.125 lb. per i.hp. hr. Oil used is California crude weighing 8.05 lb. per gal. at 60°F., and has 18,400 B.t.u. per pound.

PRESSED, SEWER, AND PAVING BRICK must not crush at less than 5000 lb. per square inch gross area, hard select common brick under 2300 lb., and common brick under 1800 lb. per square inch.

JAPANESE drill men working with a California rotary in the Echigo fields, for the Nippon Oil Co., recently drilled 720 ft. in three days. The rotary machine proves to be especially well adapted to the work in Japan.

FIRE-CLAY of the Dirt Hills district, Saskatchewan, Canada, has the following analysis: Silica, 51.94%; alumina, 33.62; ferric oxide, 1.5; lime, 0.23; magnesia, trace; potash, 0.82; soda, 0.22%; and loss on ignition, 11.44 per cent.

DRILLERS at No. 3 well of the Lakeview No. 2 Oil Co., on the Maricopa flat, California, have made a record for rapid work, drilling 675 ft. in 5 days, using a 'disk' bit recently introduced. The rock consisted of clay and gravel, which is considered hard work on an ordinary bit.

WEIGHT of all metallic ores mined in the United States in 1911 was 105,000,000 tons, and that of quarries, clay-pits, oil wells, phosphate mines, and other non-metallic products together was about 300,000,000, while that of coal was 486,000,000, according to estimates of the Geological Survey.

SANITARY CANS now largely used in packing foodstuffs have little or no solder used in their making, joints being made tight by being squeezed together. It is a peculiar point about cans that the joints, which occasionally let in air, setting up decomposition of the contents, will not allow the gas so formed to escape.

SMELTERS in Canada in 1912 treated a total of 3,008,559 tons of ore, divided as follows: nickel-copper ores, 725,065 tons; silver-cobalt-nickel-arsenic ores, 8136 tons; lead and other ores treated in lead furnaces, 63,042 tons; and copper-gold-silver ores, 2,212,316 tons. These figures do not represent the complete production of smelting ores, as considerable quantities of copper and silver ores are still shipped to smelters outside of Canada.

LOW-PRESSURE steam-turbine engines have a useful field among plants with the following features: (1) Good engine design, fair operating efficiency, and increased capacity necessary; (2) inefficient engine design, condensing, or non-condensing, and improved economy necessary; (3) unsuitable or inefficient condensing plant; (4) plant location such that water-supply is limited, unsuitable, or costly, and non-condensing operation enforced; and (5) high fuel cost. For the same coal consumption, a net increase in capacity of 80 to 100% is possible, the power cost being reduced in the same proportion.

BEST Swedish filter paper is made from clean, carefully sorted rag-stock, boiled with NaOH and bleached in the half half-stuff stage by gaseous Cl. The ash content of the boiled and bleached half-stuff is 0.039 to 0.177%. Great care must be taken to beat the stuff neither too slowly nor too freely. In the former case, the rate of filtration is retarded, while in the latter case the fine grained precipitates pass through the filter. The best paper is leached with HCl and HF to decrease the amount of ash, and after this treatment it is frozen in order to render it softer and more porous. The paper is hand made, and the most rigid control is maintained over all stages of its manufacture.

SILVER production from the McKinley-Darragh mine, Cobalt, in 1912, was distributed in the following products:

	Tons.	Av. oz.
Nuggets	1.451	17,184.0
No. 1 ore	172.174	3,430.0
No. 1 picking belt	131.475	1,838.7
No. 2 picking belt	182.579	413.1
Jig concentrate	202.887	1,343.4
Sand concentrate	554.999	750.7
Slime concentrate	851.027	294.3
High-grade fines	84.555	2,345.5
Fines produced	85.810	789.3
Total	2266.957	912.9

SMELTING is to be done by the Calumet & Arizona Mining Co. at Bisbee in a new plant consisting of the following: Crushing and sampling plant of 200-tons capacity per hour, using Snyder automatic samplers, in two sections, in a building 40 by 84 ft. in plan, and 5 stories high; bedding and conveying plant similar to that at Cananea, Sonora, there being three beds for coarse and three beds for fine ore, of a capacity of 10,000 tons, also a bed for coke of 5000 tons capacity; roasting plant consisting of twelve 21.5-ft. diam. Herreshoff furnaces, having a capacity of 80 tons of fine ore per day; and two 48-in. by 40-ft. blast-furnaces, and four reverberatory furnaces, 19 by 100 ft., the matte from which will be conveyed in ladles to six Great Falls type converters. The water-supply for the blast-furnaces will be 200,000-gal. capacity, while three steel tanks of 10,000-bbl. capacity each will hold the oil-supply for the reverberatory furnaces.

'ANNUAL,' 'representation,' or 'assessment' work required by statute is one of the principles of the common law of mining wherever found. It was originated by the miner so that each occupant of mineral ground might show his good faith by doing something toward developing the ground, instead of holding large areas without exploration. Its wisdom has remained unquestioned through all the ebb and flow of criticisms and proposed changes of the mining law. State statutes or district rules may require more than $100 worth of work, but they cannot fix the amount at less. The first annual labor must be performed in the calendar year following the calendar year in which the location was made. Thus a claim located at 1 a.m. on the morning of January 1, 1910, needs no annual labor during 1910, but does require $100 worth of work during 1911. If a claim be located in December 1910 and discovery work valued at $100 is commenced and completed in 1911, the discovery work answers for the necessary annual labor for 1911. The work may be performed upon the ground of the claim. It may be performed off the claim, but upon a group of which the claim in question is an allied member, or it may be performed upon ground away from the claim and not included in the group.

EDITORIAL

WHAT is the record for double-hand and single-hand drilling in contests? A correspondent asks, and we confess to having lost count.

MANAÑA, travelers in countries to the south of us declare, is not 'tomorrow,' as the dictionaries try to make us believe, but is really the name of the day that never comes. One young American engineer, grasping this point, promptly forbade his *mozo* to use the word and made this the first step in teaching promptness.

HEREAFTER the *West Australian Mining, Building, and Engineering Journal* is to appear as a monthly, though a weekly supplement containing quotations, items regarding contracts, and a buyer's directory will be issued. The *Journal* has given good service for ten years, and in whatever form printed will be welcome.

APPROPRIATE and graceful tributes are paid to Dr. R. W. Raymond in letters from the president and prominent members of the American Institute of Mining Engineers which we print this week. There is only one Raymond, and he has done a great work that all gladly acknowledge. If everyone who echoes the sentiments so well expressed in the letters were to have joined in signing, the list would tax the publisher.

THE UNITED STATES GEOLOGICAL SURVEY is at last to have a home, as provision to that effect was made in the public-building bill passed by Congress before adjournment. The new building is to cost $2,596,000, and of this expenditure, $596,000 is authorized, with the remainder to be appropriated as needed. Of the total sum of $96,000, a balance left from money for purchase of the site, is immediately available. Our congratulations go to the Survey and to Congress.

COLORADO mine owners are making a determined attempt to stop theft of high-grade ore. The effort to stop the purchase of stolen ore by general injunctions met with a check in the Circuit Court of Appeals, but Mr. Charles S. Thomas has applied to the Supreme Court for a review of this action. Laws in the United States are notably lax in this particular, and jury trial in such cases has proved to be a farce. There certainly should be some legal means of meeting the situation, since we can hardly advocate the summary method once applied at Cripple Creek when twenty or more illicit assay offices were dynamited in one night. Whether injunction is the proper procedure is for the courts to decide.

FREAK legislation run wild is the only fit characterization of the alien bills proposed at Sacramento. It does not seem to be generally realized that there is serious danger of the passage of a bill which would in practical operation confiscate much property in the state owned by English mining companies and which, by forcing sale of the property whenever the majority of the stock fell into alien hands, would prevent flotation of any California securities based upon ownership of real estate. The bills are intended to prevent the formation in California of permanent Oriental colonies. A simpler way to do this would be to permit such Orientals as are permanent citizens, to become citizens in name as well as fact. The number of Japanese and Chinese on the Pacific coast is not increasing, and the people we get from those countries remain alien because we force them to. The legislation proposed is uncalled for and vicious. It will properly offend not only the Japanese but Europeans and others, all of whom are affected. Also it will place the whole of the United States in a false and dangerous position to meet the prejudices of a few communities. Everyone familiar with the South sympathizes with the desire to prevent another race problem in the United States, but the legislation now under debate is a step toward rather than away from that, and is also full of danger to established business interests. It can not be too severely condemned.

SYSTEM is of first importance in a laboratory. Without it mistakes are made and trouble follows, and the department upon which a mine or treatment plant depends for guidance might as well not be there. On another page we publish rules posted in the assay office of the Zinc Corporation at Broken Hill. They are well worth wide reading, as they enforce with homely humor pertinent suggestions. Cleanliness and order is absolutely essential in assaying and analytical work. If order is maintained, it is possible to make several hundred determinations without numbering. This is done in many offices, even in those in which there is a feverish hurry to get through the day's work, and where the man who brings in a sample after midday is looked on as an enemy. Too often laboratories employ young men whose sole object is to finish the work and get away early. Fusions are hurried, samples in acids are not given proper time to dissolve, cupellations are made at unsuitable temperatures, and sooner or later there is trouble for somebody. At the assay office of the Broken Hill Proprietary, nobody follows a determination clear through, at least this was true in 1906. After each stage, such as crushing, weighing, or dissolving, the sample is passed to another room and another man. By this means a great deal of work is accomplished. The system has the drawback that it is bad for men to get into such a routine, and in case of accident those in one section of the department may not be able to help in another. This can easily be arranged by moving the assistants around occasionally, as should also be done in treatment plants. It is not good for the management to have employees get into a rut, and it is not fair to keep them in one department too long.

ELECTRICITY underground introduces many new problems; the more so since so large a portion of men and managers now in service were trained before its use became common. As told in our Book Review department, when electric power came to the Rand it was necessary to hold a special course of lectures to instruct managers in the ways of meeting problems raised by its introduction. Safety admittedly must come first, and yet we are not quite prepared to go so far as the labor delegate to a conference we once attended. Starting from the proposition just stated, he argued that since a voltage of 50 would certainly be safe, nothing higher should be permitted in the mine. Voltage is not the only matter that brings up problems, and standardization of equipment and rules is badly needed in mine electric equipment. We print this week the provisional report of the committee of the American Mining Congress on standardization of electrical equipment for metal mines. This report has involved much study and work. Before putting it in final form it is desired to have it as perfect as possible. Detailed criticism and discussion is therefore invited. We will gladly make space for suggestions.

QUESTIONS relating to persistence of ore in depth are of perennial interest. It has been our pleasure to publish many important articles bearing on the subject, notably the contributions of Mr. F. Lynwood Garrison, of Mr. T. A. Rickard, and the discussion they evoked. We are old-fashioned enough to believe that it makes a deal of difference what type of deposit is involved. Certainly the chance of persistence in depth is notably less in the case of the lead-zinc deposits of Wisconsin than the lead-silver veins of the Comstock. No arbitrary rule as to depth is safe. It is from this that the importance of studies of genesis arises. Because of incomplete data they may be inconclusive, and they may even lead to wrong conclusions, but the same result follows from reliance on direct observation alone. A case in point is with regard to the importance, or lack of importance, of the finding of rich ore in depth on the Rand. In his presidential address, as noted elsewhere, Mr. M. G. Elkan summarized recent discoveries in such form as to show not only that rich ore occurs, but that it is found at depth in widely scattered localities. Our Johannesburg correspondent, in discussing the matter, points out certain other facts which, taken together, greatly minimize the commercial importance of these finds. Regarded as the mineralization of favorable sedimentary beds by deep-seated solutions, there is no inherent reason as yet known why the Rand should not continue to produce rich ore to depths below those at present planned to be worked. It is outside other experience, however, to find such large and persistent ore-shoots even in favorable habitat, and it would be quite within the expected that the ore-shoots should decrease in size with depth as they do along the strike, and come to conform more nearly to the usual size of ore-shoots in sandstone and quartzite, such, for example, as the genetically similar orebodies in the Portland mine in the Black Hills of South Dakota.

Prospects, Mines, and Capital

Finding a mine is apparently no easy task. It will be remembered that a year ago the Canadian Mining & Exploration Company, Limited, was organized with ample funds and an excellent staff to finance and operate mining properties. While opportunities in Canada were to receive first consideration, the company was open to proposals from other countries as well. The company was prepared to provide capital for the extension of plant or re-equipment of producing mines or to undertake their management; to finance and work idle properties already developed; or to test prospects from the earliest stage of development. The balance sheet of the company shows that in the first year of its life nearly $40,000 was expended, of which $12,700 was directly spent on examinations, not counting staff salaries and traveling expenses. In all, 428 properties were considered, of which 285 were in Canada, 110 in the United States, 21 in Mexico, and the remainder scattering. So far as public information goes, no property was accepted, and it is known that only a very small number were found to present such intrinsic evidence of value or were offered on such terms as to warrant a field examination. Undeterred by their first experience, the company is still hopefully looking for a mine and has issued a circular giving details of the sort of information desired when proposals are submitted.

The experience of this company tallies with that of the Guggenheim Exploration Company, the United States Smelting, Refining & Mining Exploration Company, and other concerns actively engaged in the search for mines. Of the large number of properties submitted, a very small portion warrant field examination, and only out of the many is an occasional mine found. It is pertinent, however, to point out that each of the concerns mentioned has found good mines, and this is true indirectly of the Canadian company, since its directors and stockholders are owners of some of the best mines in America. It is not that there are no mines still to be found, but owners of undeveloped and idle properties have so little knowledge of how to present a property, of what a property must show to warrant its purchase, or such exaggerated notions of values, that it is hard to do business. From every mining camp there is hopeful talk about the coming of 'outside capital,' and yet it rarely takes more than a few minutes study of proposals as actually made, to show that they are not on a business basis. Few owners of prospects even know how to get an honest sample of their ore, and with the best intentions they deceive themselves and others. The miner must have hope, but it is well also to have ore. If you would sell a prospect, find out first what you have, then write an accurate statement regarding it. A two-cent stamp will take your papers to any of the concerns mentioned, or a dozen others, and your property will be given just that attention that the face of your statement shows it to deserve. To sell a real property or to obtain money for development, it is not necessary "to know a man who knows a man who knows one of the Guggenheims," or to pay a long string of commissions to middle men; but you must have a property of real value and be able to convince the buyer of that fact—just as you would if you sold a horse.

Filtration Royalties

Complete settlement of litigation over vacuum filters is still far off, but at least progress is being made. It is true that individual suits continue. The Moore Filter Company is suing the Talisman Consolidated in New Zealand, and the Lord Nelson in Victoria, while at Kalgoorlie a defence fund has been raised. Nearer home prospects are brighter. The Moore company and the Oliver Continuous Filter Company wisely decided to substitute friendly negotiations for a threatened battle in the courts, and a complete adjustment of all points at issue between these concerns has been reached. While full details have not been made public, it is understood that all questions of infringement as between the two concerns are dropped, and all present users are protected in existing rights. For the future both filters will be sold by each company, and sales are to be upon the basis of the lowest permissible first cost with a tonnage royalty, graduated according to the richness of the ore. Users may commute future royalties on a three-year basis. We congratulate both companies upon the making of this agreement, and we earnestly hope that means may be found to avoid threatened litigation in other directions. The rewards of invention should go more largely to the inventor, and taking into account the expense of defending the usually nebulous rights granted by a United States patent, it will often be found that a compromise is better than a fight. Mining men are mainly concerned in having the free choice of all types of apparatus without fear of becoming involved in litigation between rival patentees. They are, we believe, willing to pay a proper profit either in lump sum or in royalties to the men who make their own success certain, or increase their profits from a venture. In the United States there has been among mining men a strong objection to patent royalties. Just why, is not clear, since in other business relations royalties are a common phase of mining. Lump sums, either in excess manufacturers' profits or commutation of royalties, while commonly paid would seem to be peculiarly inappropriate in mining. In this industry it is especially important to keep down initial investment because the individual venture may prove a failure, but a share in going profits can be more freely granted for the reason that the mining ventures that do prove profitable afford a large margin. Inventors, because they increase the profit made by users of their machines, are entitled to share in that return and the royalty basis is fundamentally sound. In the past, mining companies have paid thousands of dollars in the form of excess sale prices on machines that, through no fault of the latter, were never used or were only run a short time. It would certainly seem more economical as well as fairer, to buy at lower rates and pay in proportion to returns received. The amount of the royalty, naturally, is a matter for negotiation.

Transportation Facilities in Central Africa

By Sydney H. Ball and Millard K. Shaler

Mining is so dependent upon improvements in transportation facilities and in means of communication, that the following résumé of the progress made in those directions in the Belgian Congo and neighboring colonies during the year 1912 may be of interest.

Congo Steamer Service

The steamer service between Antwerp and Matadi, the port at the head of navigation on the Lower Congo, has been improved by adding to the fleet of the most important steamship line (Compagnie Belge Maritime du Congo) two modern liners of 7500 tons, the *Anversville* and new *Albertville*. The time from Antwerp to the mouth of the Congo river has been reduced to 18 days. Other lines have likewise added to their fleets, and it is rumored that a new Italian line intends to run from Antwerp directly to the Congo.

Practically all travelers to the Katanga, in southern Belgian Congo, sail by the Union Castle line by way of the West Coast to Cape Town, or the German East Africa line. The former line has two sailings a week from Southampton, the mail steamers making the voyage in 17 days. The German line has recently doubled its passenger and transport service. From Cape Town to Elisabethville, *via* the Rand and Victoria Falls, is 6½ days' travel by rail. The route *via* Beira (Portuguese East Africa), Salisbury, Victoria Falls, and Elisabethville, is also occasionally used to the Katanga, but is rather long, the voyage from Naples to Beira lasting about 24 days. A five-days train service connects Beira and Elisabethville.

The East Coast route, *via* Suez and Mombassa, British East Africa, thence by rail to Port Florence on Lake Victoria Nyanza (from this port there is a weekly steamer service to all points on the lake) is popular with travelers to the Great African Lakes region. The Union Castle and the German East African lines each has a tri-weekly steamer service down the East Coast. The French company, Messageries Maritime, runs a mail service from Marseilles to Mombassa, the voyage taking 17 days. This route brings the Kilo gold mine, in Belgian Congo, within one month's travel of Marseilles.

River Steamers

The Congo river above Livingstone Falls (that is, above Leopoldville), with its numerous tributaries, is a great highway for river steamers. The importance of the Congo river and its tributaries as arteries of communication is evident from the fact that for boats of 22 tons there are over 7500 miles of navigable waters, and for boats of more than 500 tons over 1050 miles. The navigable rivers are being continuously improved by the placing of buoys and by the removal of the larger rocks from the more dangerous places. Boats are also running on the magnificent chain of lakes on the eastern border of the colony.

The 'Diesel' motor-boat given by the Belgian King for mail service on the Upper Congo was near completion on June 1 last. This boat is a three-decker of the Nile type, about 200 ft. long and 26 ft. broad, with a draught of 3.6 ft. It is a 430-ton, two-propeller boat of 1300 hp., with a speed of 15½ knots, and will make the voyage from Leopoldville to Stanleyville and return (2672 miles) in about 14 days, instead of the 30 to 35 days now necessary. She will carry oil for the round trip from Leopoldville and, later, extra oil for smaller steamers which may ply on the tributary streams.

Pipe-Line for Oil

In this review last year mention was made of the proposed construction of a pipe-line 250 miles long from below Matadi to Leopoldville, to furnish crude oil for steamers on the Upper Congo. The line, now nearly completed, is 4 inches in diameter and will have 8 pumping stations. It will be capable of delivering annually some 50,000 tons of crude petroleum. The oil must be pumped from sea-level to an elevation of 2400 ft. (Thysville), thence it falls to an elevation of a little less than 1000 ft. at Stanley Pool on the Upper Congo. The tank farm on the Lower Congo at Ango Ango has storage for 8000 tons of oil. The company building it expects to have the line in operation by March or April 1913. On the upper river, above Stanley Pool, oil barges are to be launched to furnish oil to the up-river steamers. To date favorable contracts for crude oil delivered at Ango Ango have not been made, and the company is considering commissioning its own ocean tankers.

A drydock is now being built at Leopoldville and a floating dock of 800 tons' lifting capacity is soon to be sent out to the same port. The state is setting up a 500-ton steamer for the Kasai river service, has ordered a dozen smaller steamboats for the Upper Congo river, and is contemplating adding a steamer of 800 to 1000 tons to its river fleet. Soon seven 500-ton steamers will be plying between Leopoldville and Stanleyville, two belonging to the state and five to the Great Lakes railroad. Both the state and commercial companies have added fast boats to their fleets, and it is expected that these boats, many of which can burn oil, will considerably reduce the time in ascending the Congo.

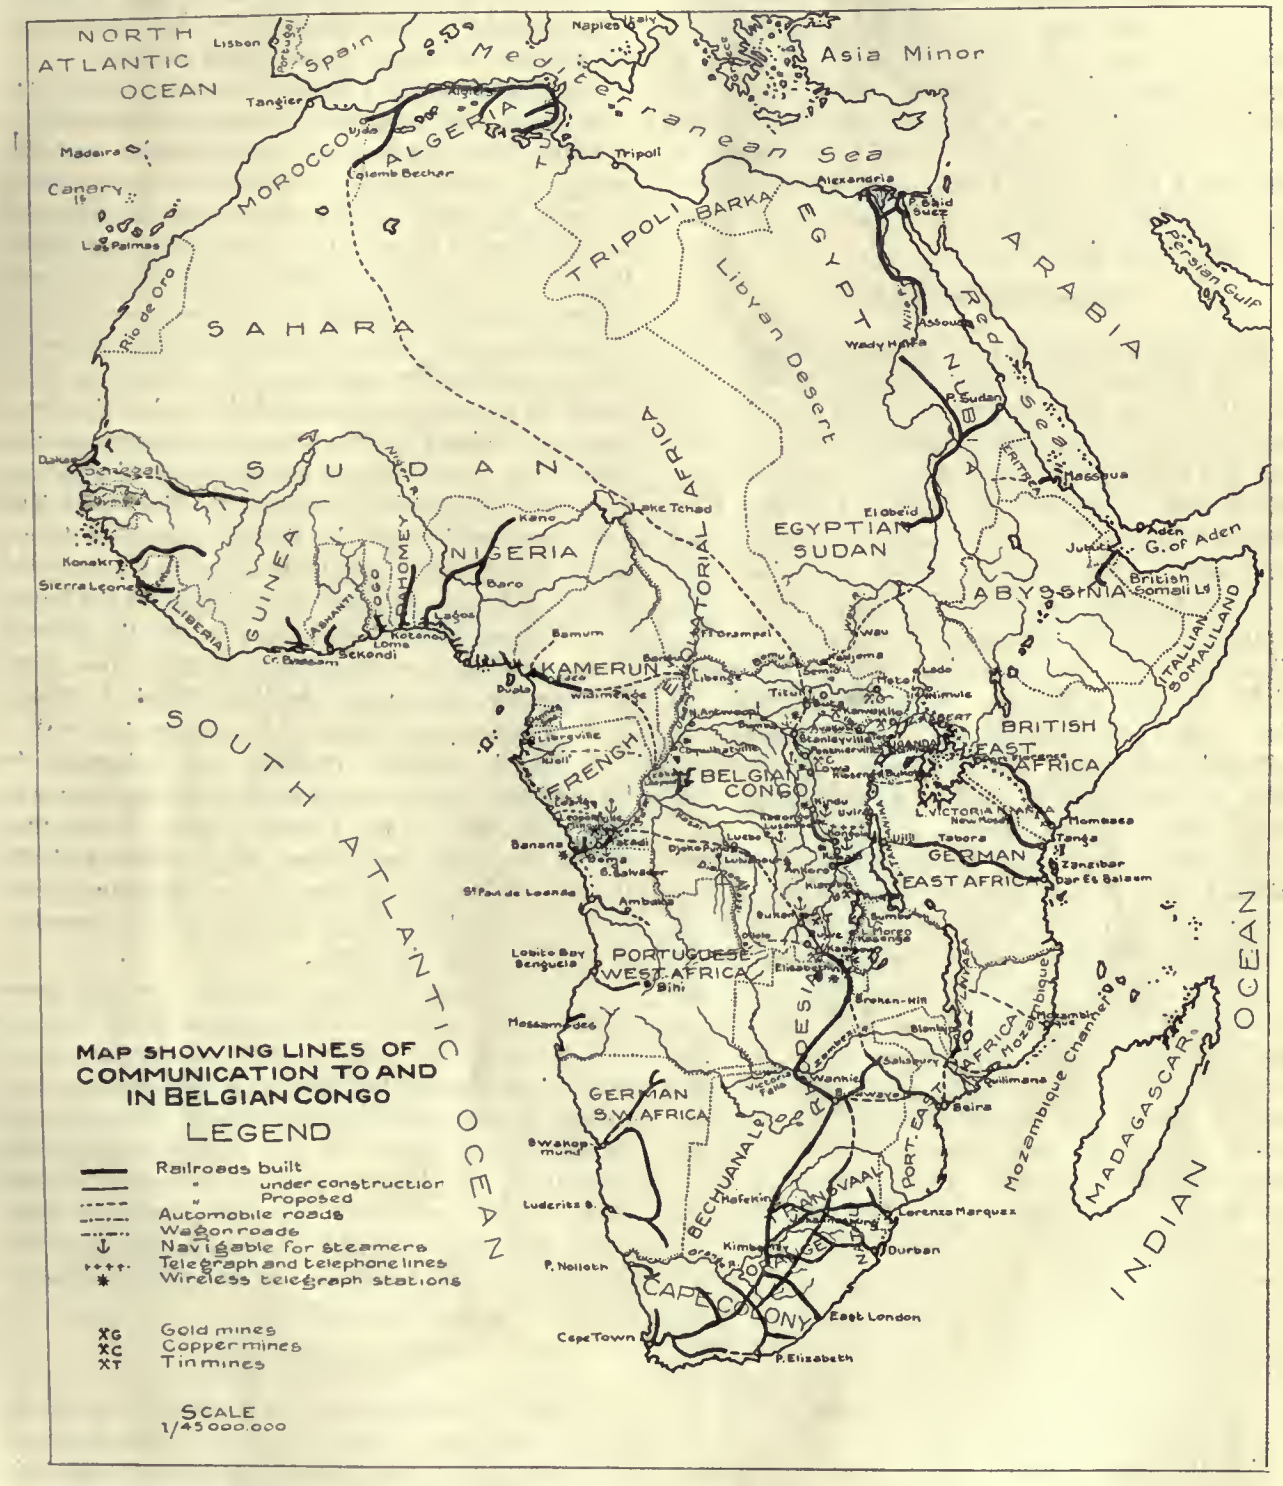
The Great Lakes railroad has regular steamer and railroad service between Stanleyville and Kongolo. There are 300 miles of rail in two sections. The river stretch, Ponthierville to Kindu, 200 miles, takes two to three days. Among the four steamers plying between these latter points is one of 100 tons. A monthly steamer service is assured by the same company between Kongolo and Bukama, in Katanga. The trip takes about six days. From Bukama to Kambove is 200 miles by caravan route, largely practicable for bicycling. In this region the minimum wage of porters is about 35 cents per day.

food included. Once a month during at least eight months in the year, the company runs steamers from Kongolo to Kiambi, three to five days' voyage up the Luvua river, near which recently tin has been found. On these upper sections the Great Lakes Railroad Co. operates one steamer of 200 tons and one of 50 tons. Two barges of 200 tons and a tug are being built at Kongolo. Kiambi is 18 days' march from Elisabethville, a considerable part of it possible on a bicycle.

The state has a regular steamer service on Lake Moero between Pweto at the north end of the lake and Kasenga on the upper Luapula river, a three-day trip. Steamers also run on Lake Tanganyika from Sumbu to Uvira. On the latter lake a German steamship company also operates, and on Moero an English trading company has a small steamer.

Railroads

Considerable progress in railroad building has been made during the year. The completion of the railroad from Elisabethville, where the smelter of the Tanganyika Concessions Ltd. is situated, through the copper belts to Kambove, has been retarded by labor shortage. Rails have, however, been laid on 67½ of its 106 miles of length to the Lufira river, and the grade is finished 14 miles farther. It should be completed about April 1913. It was estimated that this line would cost a little under $35,000 per mile. Construction of the line from Kambove toward Bukama, about 200 miles distant, will then begin. In June 1912 material and workmen were being sent from Kongolo by steamer to Bukama, and work has begun at that end of the line. This line should be finished in 1914 or 1915



(more probably the latter year), and will give through rail and steamer connection between Europe and Cape Town by way of Matadi and the Congo river.

The branch of the Great Lakes railroad (167 miles long), starting at Kabalo, 50 miles above Kongolo, and ending at Lukuga on Lake Tanganyika, opposite the German post Ujiji (80 miles by boat), is well under way. December 31, 1912, 60 miles of rails had been laid, and for 40 miles farther the grade is completed, as is also the 140-metre bridge across the Lnizi. This road should be finished by the end of 1913 or soon after. Coal was discovered near this line a year ago, at a distance of about ten miles from the lake.

German Railroad Lines

The German line from Dar-es-Salaam (East Coast) to Ujiji on Lake Tanganyika, reached Tabora early in 1912, and on October 1 was 82 miles west thereof; the line will be completed, presumably, early in 1914. The 530 miles from the coast to Tabora cost about $20,000,000, or $37,000 per mile. The line from Tabora to Kigoma, a bay on Lake Tanganyika about three miles north of Ujiji, will be 260 miles long, and will probably cost over $42,000 per mile. The completion of this railroad will put Lake Tanganyika, one of the most beautiful lakes in the world, within 20 days of Europe. With the completion of the German and Belgian lines to Lake Tanganyika, rail and steamer service will cross Central Africa from Dar-es-Salaam on the East Coast to the mouth of the Congo on the West.

The Germans are also to extend the Usambara railroad (now at New Moschi, 196 miles inland from Tanga and at the foot of Mt. Kilimanjaro) to Mambo, German East Africa, and it will supposedly terminate finally at Lake Victoria. They are also building a railroad from Duala, 4°N. latitude on the Kamerun coast, to Bidjoka, 95 miles. The line is already open to a point on Sanga river 50 miles west of Edea. On the West Coast the Germans, almost as soon as they received a portion of the French Congo as a result of the Morocco incident, considered the advisability of continuing this line to either Libenge on the Ubanghi river (at the mouth of the Lobaje) or to the Congo (at the mouth of the Sanga). It is reported that the Germans are to build either a railroad or an automobile route between Bukoba, on Lake Victoria, and Kissenge, on Lake Kivu, which lies between German East Africa and Belgian Congo.

The Mayumbe railroad, which goes north from Boma, Belgian Congo, is now being operated for over 70 miles, and it is stated that eventually it will serve the Minduli copper mine, in French Congo. The latter is now, however, connected by a light railroad 95 miles long, with Brazzaville, a town on the French side of Stanley Pool, where connection is made at Kinshasa.

The main artery of trade between Congo seaports and not only the Upper Belgian Congo, but the French Congo as well, is the Lower Congo railroad from Matadi to Leopoldville, 250 miles. Recently this road has somewhat reduced its freight tariffs, although even further reductions would notably aid in the development of the colony. The double-tracking of this line is still under consideration as a possibility, as is the reduction of its curves and grades, and the widening of its gauge. The problem of its electrification has recently been studied. Six waterfalls on the Congo were found capable of furnishing 113,000 hp., enough for the railroad and the lighting of several Lower Congo towns.

The French project for a trans-African railroad from Algiers to Cape Town, using the Belgian-English line from Stanleyville to Cape Town, took the past year, rather definite form by the incorporation of L'Union Française pour la Réalisation des Chemins de Fer Trans-African. In January 1912 an expedition to make a preliminary survey from Colomb-Bechar (the present southern terminus of the Algerian railroad) to Lake Tchad, started out from the former point. The engineer who arrived at Lake Tchad in September is said to believe that the crossing of the Sahara desert presents no unsurmountable difficulties. From Lake Tchad the line will presumably follow the divide between the Shari and Nile basins and will enter the Belgian Congo at Semio on the Bomu river, from there going to Stanleyville. The French have also under consideration the building of a railroad from Libreville, on the French Congo coast, to Nouvelle Anvers, on the Congo river. The first two sections of the line (N'Jole to Makakou), a distance of 300 miles, have been surveyed.

A French company (Société des Sultanats du Haut-Ubanghi) has made a preliminary survey north from Kadjema (Upper Ubanghi river) to the rapids on the Suen river, thence by the Wau and the Bahr-el-Ghazel to the Nile. A narrow-gauge railroad is to be built from Bangui to Fort Crampel, both in the French Congo.

A line 360 miles long (one-metre gauge) from Pointe Noire on the Atlantic, just south of Loango to Brazzaville on Stanley Pool, presumably to be built by the French, will furnish a much-needed competitor to the Lower Congo railroad. This year the Government proposed to vote $17,000,000 for the construction of this line and the betterment of the ports at either terminus. It will presumably take some eight years to build. A branch line from this road to the M'Boko Songo (French Congo) copper mines is among the possibilities.

The Benguella Route

William's Benguella railroad, which has as its goal the Katanga copper belt, is, as projected, about 1225 miles long. Of this, 425 miles, from the Katanga copper belt to the Belgian Congo frontier, is to be built by Belgian capital. The Atlantic end of this railroad was opened to traffic on September 17, 1912, for 270 miles from Lobito bay. By June 1913 it should reach Bihi and have 325 miles of railroad under operation. Upon arrival at Huambo, a little over one mile above sea-level, the most difficult part of the line will have been finished. Should capital be found for the completion of this road, it will be a most valuable adjunct to the exploitation of the Katanga copper belt, since it will give a short-line competitor to the railroads from the

south. According to agreement with the Portuguese Government, this line must advance each year at least 100 km., at which rate it would reach the Belgian Congo frontier in 1921 at the latest.

The surveys for the railroad from Lusambo (Sankuru river) to Bukama (Upper Congo river) are finished, and work will presumably begin upon the arrival of the Cape-to-Cairo railroad at Bukama in 1914 or 1915. The route will probably be changed, however, as further surveys are being carried on with the idea of fixing the western terminus at N'Dolo on the Lower Congo railroad near Leopoldville. The proposed new route touches Luebo, Luluabourg, Kanda Kanda, and Mutambo, Mukulu, and not Lusambo, joining the Cape-to-Cairo railroad at Lubende, some 15 miles south of Bukama. The line as outlined would be about 1250 miles long, and its completion would probably take some twenty years.

The route previously mentioned as being opened into the northeastern part of the Belgian Congo *via* Mombassa and Lake Victoria has recently been greatly improved and is used largely for access into the Ituri and Lake Albert regions. Supplies for the Kilo gold mines are also sent by this route. From Port Florence, on Lake Victoria, an 800-ton steamer calls weekly at all the ports, including Jinja (Ripon Falls), Kampala, and Port Bell. For travelers to Lake Albert or Kilo, landing is made at Jinja, from which port a railroad has been constructed to Kakindu on Lake Kioga. Here a steamer is taken for Port Masinda, whence a motor road is utilized to Butiaba on Lake Albert. Steamer service exists on this lake to Mahagi, whence a motor road, nearly finished at this date, is available to Kilo or to Nimule on the Upper Nile. The sole break in an otherwise continuous steamer, rail, and motor communication between Mombassa and Alexandria on the Mediterranean sea, is 105 miles of caravan route between Nimule and Lado (Gondokoro). There is also a weekly motor service between Kampala and Toro (Fort Portal), and a good caravan route thence to Boga (on the Semliki), Irumu, and Kilo. By the East Coast route, mail arrives in Europe from Avakubi (on the Ituri) in 45 to 50 days, and from Kilo in about 40 days.

In 1913 a railroad will be begun from Beira to the Shire Highlands, to join with the railroad existing between Port Herald, on the Zambeze, and Blantyre. It is expected that the latter will be extended to the south end of Lake Nyassa. Steamers are now plying on this lake, and it is probable that some time its north end will be connected by rail with Lake Tanganyika, thus forming another entry into the Belgian Congo. The projected continuation of the branch railroad northwest from Salisbury would materially shorten communication between Beira and the Katanga copper belt.

Auto and Wagon Roads

Auto roads are being constructed in the Katanga between Elisabethville and Kasenga on the Luapula river, and between Kambove and the Biana plateau country, through the Pande valley. A wagon-road has recently been built between Nioki, the Portuguese post seven miles below Matadi on the Congo river, and San Salvador, 120 miles away in Angola. A wagon-road is under way between Stanleyville and Avakubi, and mule haulage has been undertaken in the Uele district between Titule (the end of the automobile road from Buta) and Angodia.

Telegraph, Telephone, and Wireless

The Belgian colony owns telegraph and telephone lines from Banana to Coquilhatville; Kasongo to Uvira; and one from Elisabethville, in the Belgian Congo, to the Rhodesian frontier. The latter connects with Cape Town. A telegraph line has been built between Matadi, the chief Congo port, and Nioki, in Angola; this latter port is connected with Saô Paul de Loando, which has cable communication with Europe. Formerly cable messages were all sent by wireless from Kinshasa to Brazzaville (French Congo) and thence to Loango, on the Atlantic coast. Cables, of course, can also be sent by wireless to the Atlantic coast stations, or telegraphed from Brazzaville to Loango. A telegraph line connects Fort Portal, Entebbe, Kampala, Kakindu, Masindc, Ninule, M'Bale, and Port Florence to Mombassa on the East Coast.

The Belgian Congo budget for 1912 included $340,000 for the extension of wireless stations in the Belgian Congo, with an additional $81,000 for the upkeep and exploitation of those existing at the first of that year (Leopoldville and several others in the Lower Congo). At present, stations exist at Bukama, Banana, Boma, Matadi, Leopoldville, Coquilhatville, Kisala, Stanleyville, Kindu, Lowa, Kongolo, Kikondja, and Elisabethville. Later other stations are to be erected. In consequence, Boma, on the Lower Congo, and Elisabethville, are in communication by wireless. Messages have been sent and received between Kongola and Stanleyville (435 miles), and Kindu and Brazzaville, French Congo (750 miles), and unreadable signals have been heard between Lisala and Elisabethville (1060 miles). Banana, at the Congo mouth, has communicated with Swakopmund, German Southwest Africa. In the French, English, and German possessions in Africa, a number of widely distributed stations exist, and it is probable that within the coming year wireless messages can be sent from one end of Africa to the other. At first considerable difficulty was experienced because of the effect of sunlight on the shorter waves, and the best results were obtained between 2 and 6 a.m. Now, however, messages are sent during the day. An extra high-power station is being erected at Brussels, in the hope that eventually communication can be established between Belgium and her colony.

Conclusions

From the above it will be seen that considerable progress is being made in opening lines of communication in Central Africa. The importance which wireless telegraphy has for mines situated in out-of-the-way corners of the world is as yet little appreciated. The erection of wireless stations, one at the nearest railroad, the other at the mine, is much cheaper than that of a telegraph line, and the personnel required much less. In many regions in

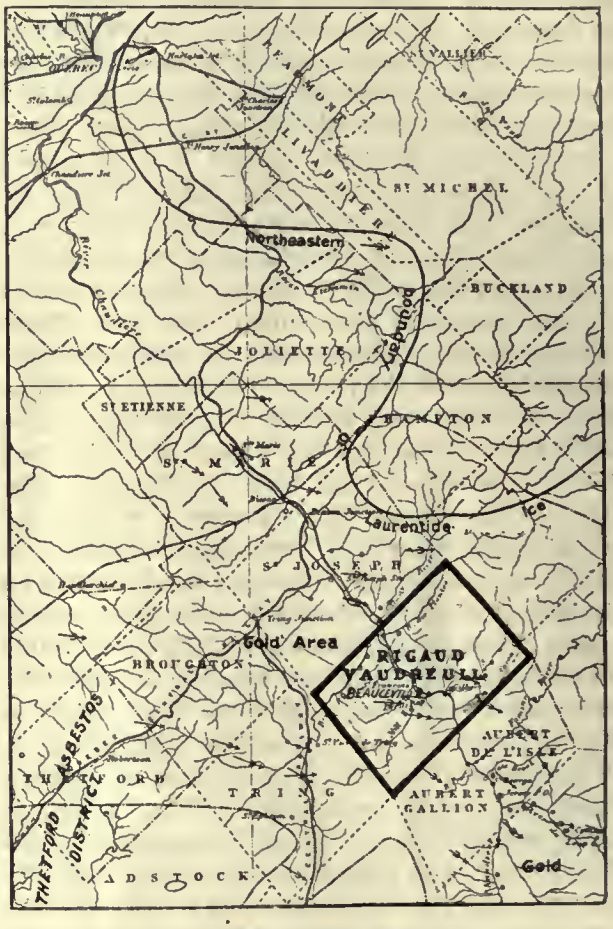
which the theft of telegraph wires or the destruction of the poles is a pastime with the natives, the wireless has undoubtedly advantages. Progress in railroad building during the past fifteen years has been particularly noteworthy. With a white population of 4000, there are at this date 788 miles of railway in operation in the Belgian Congo alone, and almost 500 miles are under construction. There is, then, almost one-quarter mile of railroad in operation in this colony per white inhabitant. Mining interests have added an important impetus to this progress, and the future of mining in Central Africa depends largely on the continued extension of routes of communication. It may be pointed out that Alaska has today only 465 miles of railroad, a comparison not in keeping with the general idea that tropical countries are backward in development.

Persistence of Ore on the Rand

In the course of his presidential address at the annual meeting of the Chamber of Mines on February 27, M. G. Elkan noted the numerous instances shown recently of excellent ore disclosed at the present deepest points of working in several mines all along the Rand. He gave the following instances. The Geduld Proprietary Mines struck the reef but a few days before at the deepest point of its workings, 1925 ft. vertical from the surface, obtaining the value of 12.1 dwt. over a width of 48 inches. The New Modderfontein Gold Mining Co., in its circular shaft, has struck the reef at a depth of 2158 ft., where it disclosed a value of 13.2 dwt. over 48.4 in. At the Modderfontein Deep Levels, in the incline shaft, which has reached a point equal to a vertical depth of 3100 ft. from the surface, a value of 10 dwt. over 46.8 in. has been obtained along a distance of 420 ft. At the Cinderella Consolidated, on its deepest, the fifth level, which runs at a vertical depth of 4440 ft. from the surface, 1350 ft. driven and sampled give an average value of 9.1 dwt. over 42 in. At the City Deep, on its deepest, the tenth level, or at a vertical depth of 3286 ft., the main reef leader has given an average value of 14.7 dwt. over 28.9 in. The nineteenth level—the deepest—driven at a vertical depth of 4190 ft., showed the main reef leader to have a value of 10.4 dwt. over 36 in. The Crown Mines, at its deepest working, the sixteenth level cross-cut from No. 5 shaft, at a vertical depth of 2660 ft., has exposed a large body of reef, being the main reef leader and the main reef, of quite abnormal width and value—the main reef leader alone has given 11 dwt. over 132 in. Farther west, the Consolidated Main Reef, which quite recently struck the reef in its No. 3 vertical shaft at a depth of 2365 ft., at which point it assayed 17½ dwt. over 48 in. In the Roodepoort district, the Princess Estate, in the central section at the deepest working point, 2758 ft. from the surface, the 1690 ft. driven on the twelfth level have given an average assay value of 9.31 dwt. over the milling width of 26 in. The mines cited are many miles apart, and are spread all over the Rand from east to west.—*South African Mining Journal.*

Mining Alluvial Gold in Quebec

Nuggets of gold were found in the eastern townships of Quebec as early as 1834, and in the past three years serious efforts have been made to work the alluvium near Beauceville by modern methods. The ground lies within the Seigniory Rigaud Vaudreuil, and the operations have been conducted by the Champs d'Or Rigaud Vaudreuil, Ltd., of Montreal. This company was organized in 1907 with a capitalization of 1,000,000 shares of $1 each. Of the total, 500,000 shares were given for the property and in addition $75,000 cash was paid, the



QUEBEC PLACER FIELDS.

company at the same time assuming payment of a balance of $122,593 due. The mining rights cover 71,000 acres, of which part has been tested by drill under direction of Fritz Cirkel. According to Mr. Cirkel, the tested ground covers an area approximately 2¾ miles long by 200 to 700 ft. wide. Within these limits it is estimated that there are 7,300,000 cu. yd. The results of drilling are said to range in value from 11c. to 28c. per cubic yard, including material from surface to bedrock. Two tests by hydraulicking are quoted, the first showing a recovery equivalent to 36c. per cubic yard from 2600 cu. yd., and the second, based on 16,600 cu. yd., a recovery of 42c. This second run was made in 1911. The water for hydraulicking is brought from Lake Fortin, seven miles above the workings on Rnisseau des Meules, by ditch and flume. From the penstock there is an 18-in. pipe 5200 ft. long giving a head of 270 ft. and supplying three giants having 3, 4, and 6-in. nozzles, respectively. At Beauceville, on the Quebec Central railway, and 1½

miles away, a power-house was built containing a 25-hp. engine and 150-kw. generator which delivers current to the mine. This power was used to drive a mechanical elevator, which by means of a line of 52 buckets, of 3-cu. ft. capacity each, stacked 6000 cu. yd. per 24 hours. There is also a portable derrick for handling large boulders and stumps. As shown by the accompanying figure, the plan of work was to break down the bank by means of giants, drive the gravel through a sluice to the elevator, and then spread the tailing by means of a third giant. As will be readily understood, the elevator was soon found unnecessary, and the work was continued by use of giants alone. Further study showed the ore burden to be barren glacial drift and the gold to be confined to old gravel on the bedrock. This has raised a question as to the economy of breaking down the whole bank, and it is understood that the feasibility of opening the property as a drift mine or of dredging is now being considered. The company operated about 5 months in 1912, and the June clean-up was $20.900. Figures for later clean-ups have not been made public. The whole enterprise is peculiarly suggestive in that considerable areas in eastern Canada are known to hold out promise of similar buried gold placers.

HYDRAULICKING AT BEAUCEVILLE, QUEBEC.

Cement was made in Canada to the amount of 2,684,002 bbl. and value of $3,098,350 in 1912, according to statistics of the Department of Mines. The largest portion of this output was from mills in Quebec.

Accidents in Metal Mines

An inquiry by Albert H. Fay, mining engineer, of the United States Bureau of Mines, and published as Technical Paper No. 40 of that Bureau, shows that fatal accidents in metal mines in the United States are more numerous, in proportion to the number of men employed, than are the fatal accidents in coal mines. Of the 165,979 employed in the metal mines in the United States during the calendar year 1911, 695 were killed, which represents a rate of 4.19 per 1000 men employed, as compared with 3.73 per 1000 for the coal mines of this country for the same period.

The total number of fatalities and serious and slight injuries due to accidents is as follows: Deaths, 695, or 4.19 per 1000 men employed; serious injuries, 4169, or 25.12 per 1000; and slight injuries, 22,408, or 135.01 per 1000. Of the total number of fatalities, 532 occurred underground, or at the rate of 5.18 per 1000, and 153 were killed on the surface, or 2.49 per 1000.

The figures show that approximately two-thirds of the total deaths and injuries that occur in and about metal mines were caused as follows: Of the fatal accidents, 32.52% are due to falls of ore or rock from roof, wall, or bank; 11.23 to explosives; 15.39 to falling down stope, shaft, or winze; and 5.32 to mine fires. Of the serious accidents, 31.37% are due to falls of roof, wall, or bank; 19.05 to car and haulage systems; 12.19 to machinery; and

6.41 to timber and hand tools. Of the slight accidents, 28.86% are due to falls of roof; 15.52 to car and haulage systems; 10.10 to machinery, and 8.02 to timber and hand tools.

The figures for the copper mines show 396 operators employing 44,693 men, of whom 31,557 were employed underground and 13,136 on the surface. The total number of deaths and injuries due to accidents reported is as follows: Deaths, 238, or 5.33 per 1000 men employed; serious injuries, 1326, or 29.67 per 1000; and slight injuries, 9016, or 201.73 per 1000. Of the total number of fatalities, 199 occurred underground, making this rate per 1000 men employed 6.31. The surface fatalities were 39, or 2.97 per 1000.

The figures for the iron mines show 207 iron-mine operators, who employed 45,953 men, of whom 25,461 were employed underground and 20,492 as surface men, including those engaged in steam-shovel work. The number of deaths and injuries resulting from accidents in these mines is as follows: Deaths, 197, or 4.29 per 1000 men employed; serious injuries, 2.032, or 44.22 per 1000; and slight injuries, 8690, or 188.3 per 1000. Of the total number of fatalities, 136 occurred underground, or 5.34 per 1000 men, and 61 employees were killed while engaged in surface work, making this rate 2.95 per 1000.

The figures for the lead and zinc mines refer only to those in the Mississippi Valley. The lead and zinc mines of other states are grouped with miscellaneous metal mines on account of the difficulty of making a distinct classification, as lead and zinc occur in so many places as associated metals in silver ores, as, for instance, in the lead-silver mines of the Coeur d'Alene district, Idaho. The Mississippi Valley lead and zinc mines form a class by themselves, and hence are easily segregated. The statistics given embody the reports of 483 operators employing 12,521 men, of whom 9247 are underground employees and 3274 surface men. The total number of deaths and injuries due to accidents is as follows: Killed, 43, or 3.43 per 1000 men employed; serious injuries, 177, or 14.14 per 1000; and slight injuries, 1311, or 125 per 1000. Of the number of men killed, 32 fatalities occurred underground, making this rate 3.46 per 1000 men employed, while 11 men were killed on the surface, or 3.36 per 1000 men.

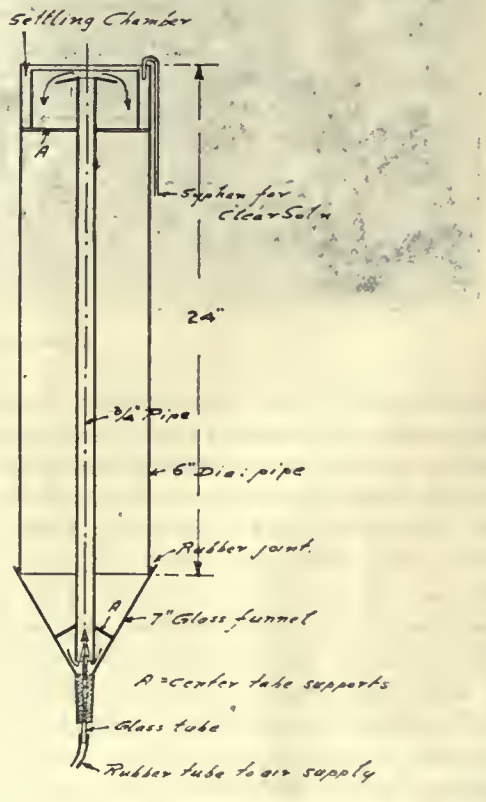
The figures for the miscellaneous metal mines show 3817 operators, employing 48,919 men, of whom 35,176 were underground, and 13,743 surface men. The deaths and injuries due to accidents are as follows: Deaths, 193, or 3.95 per 1000 men employed; serious injuries, 540, or 11.04 per 1000; slight injuries, 3078, or 62.92 per 1000. Of the total number of fatalities, 163 occurred underground, or 4.63 per 1000, and 30 on the surface, or 2.18 per 1000. The rates of serious and slight injuries are low when compared with the iron and copper mines. This may be accounted for in part by reason of the fact that this group includes many prospectors and small mines that keep no records. Fatal accidents impress themselves on the memory and are easily reported. The serious and slight injuries are soon forgotten if not recorded. Many of these mines are in states where there is no inspection, and they are not required to keep accident records. Many of the larger companies operating gold and silver and lead-silver mines of the West have for their own protection hospital service and medical aid for their employees. The reports from some of these large companies show that excellent records are being kept.

The non-metal mines employed 13,893 men, of whom 3182 were employed underground and 10,711 on the surface. The total number of deaths and injuries due to accidents reported is as follows: Deaths, 24, or 1.73 per 1000 men employed; serious injuries, 94, or 6.77 per 1000; and slight injuries, 313, or 22.53 per 1000. When compared with the copper and iron mines, these ratios seem exceedingly low. Judging from the reports received, this is largely accounted for by the fact that the mines, being small and employing an average of only 42 men each, do not keep complete records. The majority of these mines are in states where there is no state inspector, and are therefore not obliged to keep accident records and make reports thereon.

A Small Pachuca Agitator for Testing

By John Gross

*The apparatus described herein I have used in testing work lately, and have found it to answer satisfactorily for the agitation of slime as well as reground material. The accompanying drawing gives the dimensions, which follow closely the lines of the large machines used in practice.



The agitator is easily made and operated. The main cylinder consists of a 6-in. riveted pipe joined to a 7-in. glass funnel; this joint is made tight by melting rubber scrap and adding a small amount of sulphur for hardening. The melted rubber is poured

*Abstract from the Colorado School of Mines *Magazine*.

into the space around the tube and quickly sets, making a tight joint that is water-tight, not brittle, and will not break loose. For convenience the air is introduced through the neck of the funnel by means of a glass tube which can be disconnected when the tank is to be discharged. During discharging, the air is introduced into the charge through a tube from the top of the tank to avoid settling; a sample can be cut out of the discharge stream while emptying. In charging the agitator with dry material, I first put in the solution and start agitation, adding the slime or reground sand just fast enough to become mixed with the solution; this taking about 10 minutes. With a practically pure slime the agitation is perfect, and can readily be seen through the glass funnel when the pulp is not thicker than 2:1, but with thicker pulps some settling and sticking of the charge takes place in the funnel and obscures the view; when the pulp is 1½:1 or thicker, considerable settling takes place in the bottom around the sides of the funnel, and some distance up the sides of the tube, this being more marked, the thicker the pulp. In the agitation of reground sand, this settling action does not take place. The fine sand appears to have a scouring action which keeps the sides perfectly clear, and the flow of the pulp can be observed through the funnel, even on a very thick pulp.

I used with this agitator, for the air supply, an ordinary 8-gal. gasoline tank and hand-pump, as supplied with gasoline assay outfits. When pumped up to 30 lb. pressure, this tank would supply air for a period of 20 min. or more, the supply being regulated to the agitator by the valve. Where an independent supply of air is available, this is, of course, preferable, but without such a supply the agitation can be maintained by the hand pump. This requires, however, the presence of an operator during the entire time of the test. The settling-chamber (simply a short cylinder of smaller diameter than the tube, placed inside the main tube and extending 1 in. above the pulp) makes it possible to displace the pregnant solution with barren. I have been able to withdraw an amount of solution equal to the contained solution of the entire charge in 24 hours of running, this removed solution being sufficiently clear for precipitation purposes. This displacement can be arranged to be continuous if so desired, the barren solution being continuously added to the pulp in the agitation portion of the tank to keep the volume of the pulp constant. The apparatus as shown holds approximately 32 lb. of pulp. The necessary solution for a charge can be calculated and charged to the tank when ready to start the test. I have found it convenient to start agitation with less solution than the calculated amount to avoid a charge beyond the capacity, and the charge when incorporated can be added to if not sufficient to fill the tank.

A gazetteer of the surface waters of California, prepared by the U. S. Geological Survey in coöperation with the State Water Commission and the Conservation Commission of California has just been issued as Water Supply Paper No. 297 of the Geological Survey.

Raymond's Work as Secretary

In connection with the formal election of Dr. R. W. Raymond to the position of Secretary Emeritus of the American Institute of Mining Engineers, the following interesting letters were sent to Dr. Raymond and given to the technical press. The first was signed by Mr. Rand as president of the Institute and the second by H. S. Drinker and Willard H. Ward, who with Dr. Raymond are the only surviving founders of the Institute; James Douglas, James Gayley, J. H. Hammond, Charles Kirchhoff, W. J. Olcott, R. H. Richards, and R. W. Hunt, past presidents; B. S. Lyman, past treasurer; and John A. Church, Arthur Dwight, Anton Eilers, Karl Eilers, B. F. Fackenthal, Jr., W. R. Ingalls, Hennen Jennings, B. B. Lawrence, E. C. Peehin, D. M. Riordan, Robert Thompson, S. T. Wellman, W. H. Wiley, Gardner Williams, and Irving Stearns, among the members.

My dear Dr. Raymond: It has been in my mind to say to you in writing, what I have said to you verbally, in expressing my hope that the Institute is not to lose your valuable services as most competent of advisers and of editors, and that you will accept the appointment of Secretary Emeritus with its attendant salary which as you will recollect was recommended in the report of the Committee of Five and was made permissive in our new Constitution and unanimously voted by the new Board of Directors elected after a very full canvass of the Institute.

I desire in urging this upon you to say that I have felt that it would be well for us to have upon our files a statement of what the Institute owes to you, based not upon general considerations, but upon specific facts which are within the knowledge of older members (much my seniors in membership). In order that such a statement might be as complete as circumstances would at this time permit, I have ventured to request certain of the older members of the Institute to prepare a statement based on their own long knowledge of the Institute. I have received such a communication, which I have great pleasure in handing you herewith, which shall be published in the *Bulletin* and filed among the archives of the Institute, and which I personally and on behalf of the Executive Committee supplement most heartily and cordially by adding this word of appreciation to the expression of the hope indicated at the beginning of this letter—that we may long continue to feel free to consult you and to avail ourselves of your invaluable knowledge and loyalty.

Charles F. Rand, President.

Dear Sir—In connection with the official notice of Dr. Raymond's unanimous election by the Directors as Secretary Emeritus, we wish to place upon record certain statements concerning his services to the Institute which we think have not been published, and may not be generally known to the majority of our fellow-members.

When the Institute was formed in 1871, Dr. Raymond acted as Secretary of the Founders' Meeting, and became the first vice-president of the Institute, and, by request of the aged and beloved David Thomas, who was the first president of the Institute, Dr. Raymond discharged all the duties of the office of president, to which he was later formally elected in 1872, and which he held for three years. During that time, he visited Europe, and through his acquaintance and reputation abroad, established those international relations of the Institute which proved so important in later years. He also enlisted the support of the mining engineers and metallurgists of the Pacific slope, who would not otherwise have been disposed to join a society originating in the East. And for twelve years he attended, at his own expense, nearly every meeting of the Institute, wherever held, giving to it without remuner-

ation his best service, and sacrificing for it many professional and private interests.

From June 1883 to February 1905 he practically managed, under the general direction of the Council, the ever-increasing business of the Institute, as the executive officer of an unincorporated, voluntary association, the members of the Council of which were individually liable for any debts incurred. For many years he paid all current expenses (except the larger bills of the printer, etc.), recovering the amounts subsequently from the Treasurer upon drafts approved by the finance committee, which audited monthly the receipted vouchers presented by him. Any oversights or improper expenditures which occurred were his own personal loss. When the entire cash funds of the Institute were tied up by the suspension of the bank in which, with the approval of the Council, they had been deposited, he made a deposit of some thousands of dollars of his own funds in another bank, and carried the whole business of the Institute for several months, until through the ultimate recovery of its funds, he could be reimbursed. And from the annual appropriation made to him in lieu of salary, he expended large amounts for assistance in his work. During the period named, he presented to the Institute his valuable professional library, which, together with the two libraries of Clarence King and Richard P. Rothwell, purchased and presented by John Hays Hammond, and constituting the Alfred Raymond Memorial collection (so named in honor of his son, who died in 1901, while serving as his editorial assistant), form a large part of the Institute Library.

During that period, he so managed the business of the Institute as to enable it to carry the expense of publishing and distributing the *Transactions* (the volumes of which increased more than threefold in size), twice issuing two volumes in one year, and twice furnishing complete consolidated indexes; he also managed to meet, out of current funds of the Institute, the demands of the memorable joint meeting of 1890 with the Iron and Steel Institute, and of two sections of the International Engineering Congress of 1893, amounting to some $23,000, no part of which was spent on social entertainments or excursions, the whole being laid out for the hire of halls, the employment of stenographers, the printing and circulation of programmes and papers, and other items strictly germane to the technical sessions. In connection with the International Engineering Congress, two sections, those of Mining and Metallurgy, were assigned to the Institute, and neither could be refused without the abandonment of our national position as representing both. In this dilemma, he assumed, with the approval of the Council, the burden of these two sections and secured the contribution of important papers from both American and foreign authorities, the translation and editing and publishing of these papers, and their publication in two volumes, which greatly enhanced the international reputation of the Institute. Moreover, during the whole history of the Institute, his professional contributions to its *Transactions* have exceeded in number those of any other author.

In 1904, after all these ordinary and extraordinary outlays, and without having received any assistance from outside sources, the Institute was out of debt, had acquired a large library, and held an invested fund of some $18,000. This was the result of his management for twenty years. In that year, an overwhelming vote of the members dictated the acceptance of the generous gift of Andrew Carnegie, and of the consequent obligations imposed upon the Institute. In this respect, we owe to Dr. Raymond the rejection of the first plan proposed, under which the Institute would have become directly a joint owner with other societies of the new building, and the whole property might have been subject to a partition sale, as the result of a judgment against either of the joint owners. It was he who averted this situation, and the result was the creation of a separate corporation, of which, as owner of the new building, the so-called founder societies should be simply tenants under lease.

Concerning the so-called land debt, it should be said that the Institute was obliged to accept its share thereof without any alternative except the refusal of Mr. Carnegie's liberal offer. However, we are now all glad of the final result, which has given to the Institute a permanent home in a situation of social importance. The proximity of the Engineers' Club and the use by numerous scientific and technical organizations of the United Engineering Society's building, and of its commodious and convenient auditoriums, has made it a recognized headquarters for such societies. Nevertheless, the adoption of this scheme, and the acceptance of a land debt of $180,000, presented to the Institute a serious problem. At that time it was estimated that we could manage to pay from the ordinary income the increased cost of rent or its equivalent—at first $7000 per year instead of about $3000. But it was never expected that the Institute could pay, from its ordinary revenues, either the principal or the interest of the land debt. The Institute accomplished more than was expected, paying not only the increased current expenses, but also a considerable sum on interest account; and this was done by hard work on Dr. Raymond's part and on that of the office force, for which both he and they are entitled to recognition. During this period, he continued to pay from his own salary a considerable sum annually for editorial assistance.

The system of Institute excursions concerning which many criticisms have been offered on the basis of incomplete knowledge, requires consideration, since in our opinion the holding of meetings at distant points has had and will continue to have an important influence in maintaining the national and international position of the Institute. We believe that the excursions in the past have had much to do with the success of our meetings, and we hope that in connection with any plans to be adopted for the future, you will ask Dr. Raymond to prepare a complete statement on the subject such as has never yet been made. Finally, we are confident that you share our belief in Dr. Raymond's disinterested and tireless devotion to the Institute, and our opinion that the Institute has been for more than forty years a debtor to Dr. Raymond for far more than can be expressed in dollars and cents.

Gold Mines of Korea

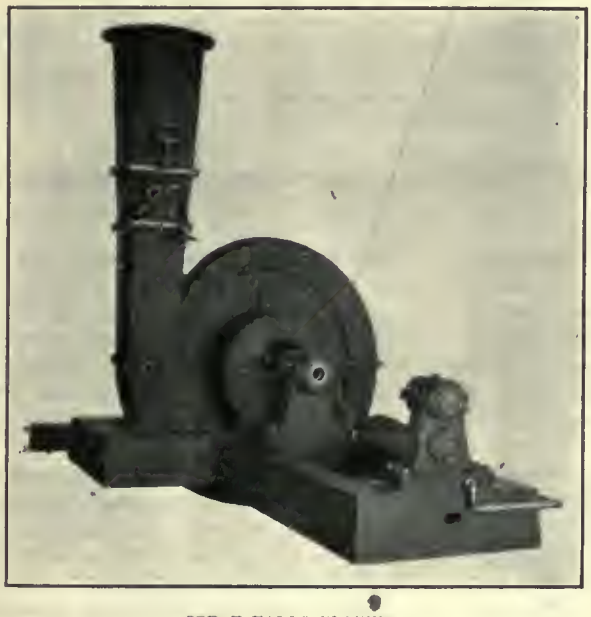
The gold mines at Suian and Unsan, Korea, are being worked by the American Mining Development Co. [Colbran-Bostwick syndicate]. The yearly production of the Suian mine is about 1,000,000 yen, while the Unsan gold mine annually yields some 3,000,000 yen gold. These two mines are the principal gold mines conducted by foreign concerns in Korea. Besides these, there is a gold mine at Chyansong, which has been recently purchased by a London firm and is now conducted under the management of French experts, the mining districts extending for 1600 square *li*. This mine is, however, still in the course of development. The Kapsan copper mine at Hamnan, belonging to the American Mining Development Co., and the Huchyong copper mine owned by the Italian Mining Co., are also in an experimental stage. Applications for quartz mines and for placer mining are occasionally sent in by foreigners, but are all on a small scale.

The Furukawa Mining Co., obtained in October last official permission to work gold mines at Chyonmamyon and Nokoli, in Knsong district, North Pyongan province. Work on these mines has been begun by the company, employing some twenty Japanese and about two hundred Korean miners. The experimental stage of the work will be, according to Gunsuke Iijima, who supervises the work as chief expert, three years, and the cost is estimated at 500,000 yen.—*Far Eastern Review.*

Great Falls Electric-Driven Turbo-Blower

By G. B. Rosenblatt

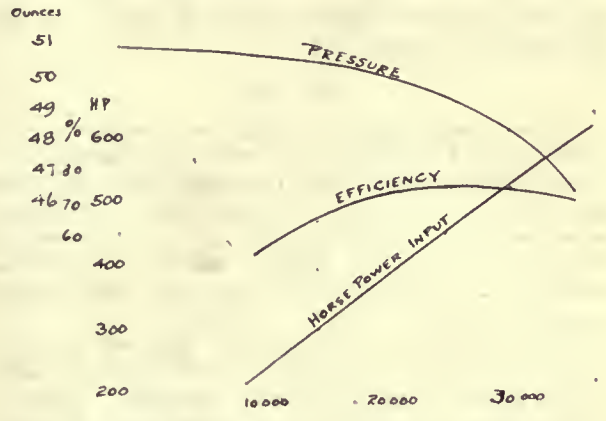
An interesting turbo-blower was recently installed in the power-plant of the Great Falls smelting works of the Anaconda Copper Mining Co. The blower has a rated capacity of 30,000 cu. ft. of free air at 48-oz. pressure. It is constructed so that it may, by slight changes, be arranged to give its rated volumetric capacity at 62 oz. It is driven by a constant-speed, 750-hp. synchronous motor, 6600 volts, 3-phase, 60-cycle, 3600 r.p.m. The motor is direct-connected to the blower shaft. There is no gearing or belting. A 750-hp. motor is not required to drive the motor at its present rating; there being only about 525 hp. required for this work. The extra motor capacity will, however, be required if the pressure is raised to 62 oz. In order that the motor may not operate at poor efficiency at 525 hp., it is designed with a flat efficiency curve, giving it practically the same efficiency from 375 to 750 hp., the efficiency at all points in this range being over 90 per cent.



GREAT FALLS BLOWER.

The blower is essentially a constant-pressure, varying-volume machine. Its characteristics are shown approximately by the accompanying curve. The same type of blower can also be built for constant-volume, varying-pressure work. The constant-pressure type of machine is particularly desirable where the blower is to operate in parallel with other blowers of either the centrifugal type or the positive cycloidal type, like the Root or Connersville. This is the case at Great Falls, and by properly dividing the load, the parallel operation of this centrifugal blower and the positive blowers is made good. The blast from the entire battery of blowers at Great Falls is used on copper blast-furnaces.

From the curve attached it will be noted that this blower has a relatively good efficiency over a wide range. This is one of the peculiarities of the centrifugal blower of this type, and is one of the reasons for its rapid introduction in Europe and Australia. It is true that at rated load a cycloidal blower will have a somewhat higher efficiency than the centrifugal blower, but it is to be remembered that a cycloidal blower must be driven from a slow-speed motor whose efficiency will be lower than a high-speed motor, and that there is introduced into the unit composed of the blower and motor the loss due to gearing, belt, or rope drive. These losses are entirely done away with in the case of a centrifugal blower, so that the over-all efficiency from electric mains to the discharge pipe will be higher for the centrifugal blower than for the cycloidal blower.



ACTUAL VOLUMETRIC CAPACITY, CUBIC FEET PER MINUTE.

The appearance of the centrifugal blower at Great Falls is shown in the illustration. The motor fits on the same bed plate with the blower in the space shown. As the unit runs at the high speed of 3600 r.p.m., the bearings are the same as those used with large turbo-generators. The revolving element is milled from a solid steel forging, held on the shaft in the same way as is the revolving field of a turbo-generator. Blower construction with riveted vanes has been tried in the past, and some such blowers are in operation, but sooner or later the rivets crystallize and the vanes give trouble, so that the use of the solid steel forging, expensive as it is, is the best solution of this problem for blower construction.

The illustration also shows the electrically controlled discharge valve. This is arranged so that it may be either actuated automatically by means of magnets or can be set by means of a hand wheel, also shown in the illustration. The blower at Great Falls has now been in successful operation for over a year, and has given no trouble whatever since it has been properly set up and balanced. The only interruption of its use in commercial service was caused by some trouble with the motor, occasioned by a burn-out in some of the coils. This was corrected some eight months ago and the blower has been in commercial service ever since. A notable feature of this blower is that, despite its high speed, it is not noisy.

Standardization of Electrical Equipment in Metalliferous Mines

A committee consisting of H. S. Sands, Charles A. Chase, and Frank E. Shepard has been studying underground electrical equipment on behalf of the American Mining Congress. A preliminary report was presented at the Spokane meeting of the Congress and published in the November-December *Monthly Bulletin*. It had received prior consideration by D. C. Jackling, W. H. Staver, W. J. Canada, P. S. Schools, and G. B. Rosenblatt. Before submitting a final report, the Committee desires the matter to receive the widest possible criticism and discussion, and to assist in obtaining this, we take pleasure in printing the preliminary draft. In submitting the report, the Committee states its intention as being to compile a set of rules which would be sufficiently broad to work no hardships on anybody and to be sufficiently exacting to bring about installations that would not only be safer, but more economical and efficient.

Definitions

The expression 'pressure' means the difference of electrical potential between any two electrical conductors.

Low Pressure.—(a) Where the conditions of the system are such that the pressure between any two conductors, or between any conductor and the earth, at the terminals where the electricity is being used cannot exceed three hundred (300) volts, this shall be deemed a low pressure system.

Medium Pressure.—(b) Where the conditions of the system are such that the pressure between any two conductors, or between any conductor and the earth, at the terminals where the electricity is being used, can exceed three hundred (300) volts, but cannot exceed six hundred (600) volts, this shall be deemed a medium pressure system.

High Pressure.—(c) Where the conditions of the system are such that the pressure between any two conductors, or between any conductor and the earth, at the terminals where the electricity is being used, can exceed six hundred (600) volts, this shall be deemed a high pressure system.

Section 1. Distribution System

Switching Station. Rule 1.—Where the generation station or sub-station is more than 500 ft. from the entrance to the tunnel or shaft, a switching station shall be installed at the entrance to the tunnel or shaft for cutting off the power from each circuit.

Hoist. Rule 2.—The circuit feeding electric hoists used for raising or lowering men shall be separate from all other circuits and shall run from the distribution centre, and no other electrical apparatus shall be connected thereto.

Lightning Arresters. Rule 3.—Where the circuits entering the shaft-house or tunnel are from an overhead transmission system, each circuit shall be protected by lightning arresters, which shall be grounded to efficient grounds prepared for that purpose.

Grounding. Rule 4.—All alternating-current systems in which the normal working pressure does not exceed the limits of medium pressure, and all three-wire direct-current systems, shall be grounded. In alternating-current power systems where the voltage does not exceed medium pressure, and where the secondaries of the transformers are connected in star, then the neutral or centre of the star shall be grounded.

Where the distribution system is delta or open delta, then the central point of one transformer shall be grounded.

Where the distribution is three-wire direct current, then the neutral shall be grounded.

The wiring for signal or telephone circuits shall be located on the opposite side of the manway, shaft, or tunnel, from the power or light wiring.

Underwriters. Rule 5.—All wiring shall conform to the rules of the National Board of Underwriters.

Shaft Wiring. Rule 6.—All power wires whose pressure does not exceed medium pressure shall be run where possible in the manway or compartment of the shaft where hoisting does not occur, and shall be either lead-armored cable or run in waterproofed or drained conduit.

If the lead-armored cable is used, the insulation must be non-hydroscopic and as acid-proof as possible. The cable shall be held in place by frequent fastenings spaced according to the weight of the cable, so that the cable is firmly and securely held in place and there is no danger of the cable 'dragging.' The lead covering of the cable must be grounded. If the wires are run in conduit, junction boxes shall be placed at every level, and in no case shall the interval between boxes exceed 150 ft. These junction boxes shall be held in place and provision made to hold the weight of the wire in the conduit leading to the junction box below on insulated supports. The iron conduit must be grounded.

Power Wires. Rule 7.—All power wires whose pressure exceeds that of medium pressure shall be of either lead-armored cable or encased in iron or steel conduit or other approved non-hydroscopic conduit; in any case, metal covering shall be well grounded with wire at least one-half the size of the largest wire in the cable or conduit.

Joints. Rule 8.—All joints must be electrically efficient, mechanically strong, and soldered unless approved solderless joints are used. All joints except in trolley wires, should be taped or otherwise suitably insulated to protect them from corrosion.

Bushings. Rule 9.—When unarmored cables or wires pass through metal frames or into boxes or motor casings, the holes shall be substantially bushed with insulating collars.

Sectionalizing. Rule 10.—Wherever branch electric circuits leave a main or secondary feeder, cut-outs and switches shall be provided for disconnecting the branch line from the supply line, and all main and distributing feeders shall be provided with sectionalizing switches at distances not exceeding one mile. All cut-outs above ground to be in approved metal cabinets, and underground in subway type cabinets.

Switches, Circuit-breakers, Fuses. Rule 11.—All switches, circuit-breakers, and fuses must have bases of marble, slate, or porcelain, or other suitable incombustible, non-hydroscopic material, free from metallic veins, and shall be placed in as dry a situation as practicable.

Circuit-breakers, Fuses. Rule 12.—Fuses and automatic circuit-breakers should be so constructed or adjusted as to open the circuit when the current through them exceeds not more than 100% the working current in the case of motors, or by not more than 30% the permissible current of the cables which they protect. Fuses shall be stamped or marked, or shall have a label attached indicating the current at which they are intended to fuse. Fuses shall be adjusted or replaced only by a competent person, authorized by the mine superintendent.

Grounds. Rule 13.—The rails of the haulage system and the air and water pipes shall be connected together wherever practicable, so that the efficiency of the 'ground' may be bettered, and where the formation is such that good electrical grounds cannot be obtained, then the tracks and air and water pipes shall be connected to a good and well prepared ground at the mouth of the tunnel or collar of the shaft as the case may be.

Section 2. Apparatus

Sizes and Capacity. Rule 14.—All electrical apparatus shall be sufficient in size and capacity for the work they may be called upon to do, and so installed, operated, maintained, and safeguarded as to reduce the danger from accidental shock or fire or overheating to the minimum.

and shall be of such construction and so operated that the rise in temperature caused by ordinary working will not injure the insulating materials.

Grounding. Rule 15.—All electrical apparatus, that is, motors, transformers, generators, and their switching devices, installed underground, shall have their frames well grounded.

Portable Motors. Rule 16.—A higher pressure than medium pressure shall not be used for portable motors.

Transformers. Rule 17.—Where pressure higher than medium pressure is used in connection with transformers installed underground, they shall be installed in a dry, well ventilated, fireproof room or compartment or station, so arranged that it can be entirely closed with fireproof doors should any accident occur, and the fire arising from the accident be smothered.

High-Pressure Motors. Rule 18.—No motors of less than 15 hp. shall be used on circuits of higher than medium pressure.

Switches and Fuses. Rule 19.—All motors, together with their starting resistance or induction starter, as the case may be, shall be protected by fuses and switches or by automatic circuit-breakers capable of entirely cutting off the current, and must be in sight of the motor.

Trailing Cable. Rule 20.—In the event of the trailing or portable cable in service breaking down or being damaged, or of its inflicting a shock upon any person, it shall at once be put out of service and shall not be used again until it has been repaired and tested by the mine electrician or assistant mine electrician.

Section 3

Employment of Mine Electricians. Rule 21.—At every mine where electricity is used below ground, a competent mine electrician, and, where necessary, an assistant mine electrician also, shall be employed, subject to the authority of the mine superintendent. The electrician shall have full charge of all electrical apparatus in connection with the mine.

Every person appointed to operate any electrical apparatus in connection with a mine shall be instructed in his duty by the mine superintendent or electrician before taking charge of the apparatus.

Inspection of Wiring. Rule 22.—It shall be the duty of the mine electrician to inspect all wiring and apparatus once every ten days, and once each month to make report of such inspections in writing to the superintendent, stating all defects found and how repaired or remedied.

Section 4. Protection

Fire Buckets. Rule 23.—Fire buckets filled with clean, dry sand shall be kept where stationary electrical apparatus is located, ready for immediate use, and regularly inspected once every month. The provision of tetra-chloride fire-extinguishers is recommended.

Resuscitation. Rule 24.—Instructions shall be placed at the mine entrance and in every generating, transforming, and motor house, for the resuscitation of persons suffering from electric shock. All employees operating the electrical apparatus shall be required to acquaint themselves with these instructions.

Recording Accidents. Rule 25.—Every personal accident occurring in connection with the operation of the electrical equipment shall be promptly reported by the person injured, or by some other person on his behalf, to the mine superintendent, and shall be recorded by him at the office of the mine.

Plans. Rule 26.—A plan on a scale not smaller than 200 ft. to the inch shall be kept at the mine, showing the position of all permanent electrical machinery and fixed cables or conductors in the mine, and shall be corrected as often as may be necessary to keep it as nearly as practicable up to date, and never more than six months in arrears.

Section 5. Haulage

Location of Wires in Roadway. Rule 27.—In underground roads, the trolley wires shall be placed as close to the side and as straight as practicable, and securely supported at frequent intervals. In all roads where it is necessary for men to travel on foot, all wires, except signal wires, must be placed on the same side of the roadway. The trolley wire shall not be less than six feet from the top of the rail unless protected from casual contact of passersby by suitable shield or trough.

Protection of Cables. Rule 28.—Where the cables in main haulage roads, where persons are hauled into or out of the mines, cannot be kept at least eighteen inches from any part of the car, they shall be specially protected.

Cables and wires, unless provided with metallic coverings, shall not be fixed to walls or timbers by means of non-insulating fastenings.

Where main or other roads are being repaired, or where blasting is being done, temporary protection must be used so that the cables are protected from damage.

Section 6. Lighting and Signal Wires

Erection of Lighting and Signal Wires. Rule 29.—Small wires for lighting or signal circuits shall either be conveyed in pipes or casings, or they may be suspended from porcelain or glass insulators or securely tied to them, so that they do not touch any timbering, rock, or metal. On no account shall staples be used. If metallic pipes are used, they must be grounded and well drained. If separate unencased wires are used, they shall be kept at least three (3) inches apart and not brought together except at lamps or fittings.

Section 7

Shot Firing. Rule 30.—Electricity from light and power circuits shall not be used for firing shots in a mine except where the electrical connection to such light or power circuit is made within an enclosed switch-room, which shall be kept securely locked and shall be accessible only to the authorized shot-firer. If electricity from light or power cables is used for firing shots in a mine, no shots shall be fired until all the men are out of danger.

Special precautions must be taken to prevent accidental contact between shot-firing cables or wires and power and lighting cables.

Only persons authorized in writing by the mine foreman or superintendent are permitted to fire shots electrically in a mine.

Battery or Magneto Exploders. Rule 31.—Where battery or magneto exploders are used, they shall be inclosed in a suitably constructed box, fitted with a removable connecting plug or key without which the circuit cannot be closed. This plug or key shall be detached when not required for firing, and shall not under any conditions pass from the personal custody of the shot-firer while on duty. Exploders shall be frequently tested by the shot-firer to insure that they give the necessary pressure and current.

The exploders shall not be connected to the shot-firing cable until all other steps preparatory to the firing of the shot have been completed and all persons have removed to a place of safety.

Immediately after the firing of the shot the firing cable shall be disconnected from the exploder, and no person shall approach a shot that has been attempted to be fired by electricity and has failed to explode, until the firing cable has been disconnected and an interval of five minutes has elapsed since the last attempt to fire the shot.

Section 8. Telephones

Telephone Systems, When Required, How Installed. Rule 32.—All mines from which exit is by shaft only, and all others in which the working places extend more than one mile from a place of exit, shall be provided with an underground telephone system, provided the number of underground employees at any one time on the regular working force exceeds 25. The system shall be of approved construction, and of such extent that no working place shall be at a greater distance than three-fourths of a mile from a telephone, and principal shaft stations shall be provided with telephones.

All main telephone cables shall be insulated with waterproof insulation, and unless run through metal pipes or casings, or approved conduit, they shall be protected by a continuous lead sheath.

Mine Rescue Work in Metal Mines

Mine rescue work, which in the United States began in the coal mines, is being extended to metal mines as well. A number of the companies have bought rescue apparatus and efforts are being made to train men in its use. The United States Bureau of Mines has for three or four years maintained mine-rescue cars. These are fully equipped with first aid and rescue apparatus and the crew of each includes, in addition to the district engineer who is in charge, a car foreman, a first aid instructor, and a cook. The men live on the car and in addition to responding to emergency calls in case of accidents, travel through an allotted district giving instruction and systematically training men. Similar cars are maintained by Illinois and by various large companies. Up to the present this work has been almost exclusively confined to the coal mining regions, though the Bureau of Mines cars have occasionally visited metal-mining districts.

Car No. 8, the latest one put in service by the Bureau, has been allotted to the Lake Superior iron and copper regions. The official headquarters of this car is Ironwood, Michigan. It is in charge of Edwin Higgins as assistant mining engineer, with Edward Steidle, foreman, and George W. Grove, first-aid man. As in the case of the other cars, No. 8 is a remodeled Pullman, a part of which has been converted into a laboratory and instruction room. It is equipped with Proto or Fleuss apparatus of English make, instead of the Draeger helmets of German make used on the other cars. There are a number of differences between the two types. Perhaps the most important is that the Proto depends upon a positive feed of oxygen, while the Draeger uses an injector.

The latter results in a slight vacuum in the absorbent cartridge and in certain parts of the circulation tubes. In case of puncture poisonous gas is thereby drawn into the circuit and this is considered to have been the cause of death in several instances. A similar accident in case of the Proto would cause deflation of the breathing bag and the wearer, thus warned, would only need to open a safety valve and make his way out at the expense of his supply of oxygen. The new type of apparatus has been extensively adopted in England but is little known here.

The new car arrived at Ironwood, November 25, and received a warm welcome. While most of the mines in the district were well equipped as to apparatus, and much money was being spent so as to assure safety, there were comparatively few men trained in the new methods. In several cases the amount of apparatus available was not adequate to anything more than the briefest campaign. Up to the middle of January lectures and demonstrations had been given to approximately 2600 people, and the number of visitors to the car had averaged above 150 per week. In all, 72 men had been trained in the use of the breathing apparatus and in first aid to the injured and there is a lively interest in the work. Within three months of the arrival of the car it is expected that 150 men will have been trained for the work.

At the Newport mine, in addition to the regular safety department, a corps of five mining engineers has recently been organized whose sole duty it is to study safety conditions in and around the mine. Other companies are organizing safety departments, and it is proposed to have representatives from all the mines meet in general committee to exchange information as to methods and appliances. A general field meet may be held next summer, as in the anthracite regions the mine managers of the district have taken an active interest in the work and at a meeting held at Ironwood in November at which all the large companies were represented the following

INTERIOR OF MINE-RESCUE CAR.

recommendations were unanimously adopted.

1. It is recommended that the outline of the course of training in mine rescue and first aid as prescribed by the Bureau of Mines and approved by the Mining Conference held in Pittsburg, Pennsylvania, September 20 to 23, 1912, shall be accepted in this district.

2. That whereas two squads of five men each can be trained at one time, and as a first-aid squad must consist of five men, and as the Bureau recommends that not less than five men form a rescue corps, that each mine train not less than five men.

3. That inasmuch as the mine safety car is equipped with Fleuss breathing apparatus and the Draeger predominates throughout the Lake Superior district, that the mine rescue training consist of the use of both types of apparatus. In the case of the Draeger, the respective company is to furnish the apparatus and material free of charge.

4. That a room of sufficient floor area shall be provided for first-aid training.

5. That whereas, the Bureau of Mines provides a set of views illustrating mine rescue, first aid, accident statistics, and experimental work carried on by the Bureau, that a hall should be provided of suffi-

cient seating capacity so that all employees and general public may be invited free of all charge.

6. That the operators of the Gogebic range shall arrange an itinerary that will cover the Lake Superior district pending the approval of the United States Bureau of Mines.

7. And, further, it is recommended that the mine managers throughout the district be notified that the mine safety car No. 8 will be at their service in the near future and therefore they should inform the Bureau of Mines at Pittsburg, Pennsylvania, of the number of men they wish to have take the complete training.

Laboratory Rules Worth Following

The following rules are posted up in the assay office of the Zinc Corporation, at Broken Hill, New South Wales, and are worthy of wide reading.

1. Upon entering the laboratory, commence work at once. Do not waste your time and that of others in idle conversation, or standing about with your hands in your pockets. If the samples are not ready, prepare a stock of the standard solution required in your work, or 'take a turn' in the preparation of samples, using both hands.

2. In addition to standard books and apparatus, you are required to make good use of the eyes, nose, hands, ears, and brains, if any, which nature has given you; use your tongue when only absolutely necessary.

3. Neatness, order, and cleanliness must be strictly adhered to. Do not litter your bench with waste paper, dirty rags, dirty apparatus, or appliances for which you have no immediate use, and never allow the stoppers of reagent bottles to touch the bench. Remember that dirty appliances are the principal source of error, especially if accompanied by want of method, dirty reagent bottles, erratic methods, and a wagging tongue.

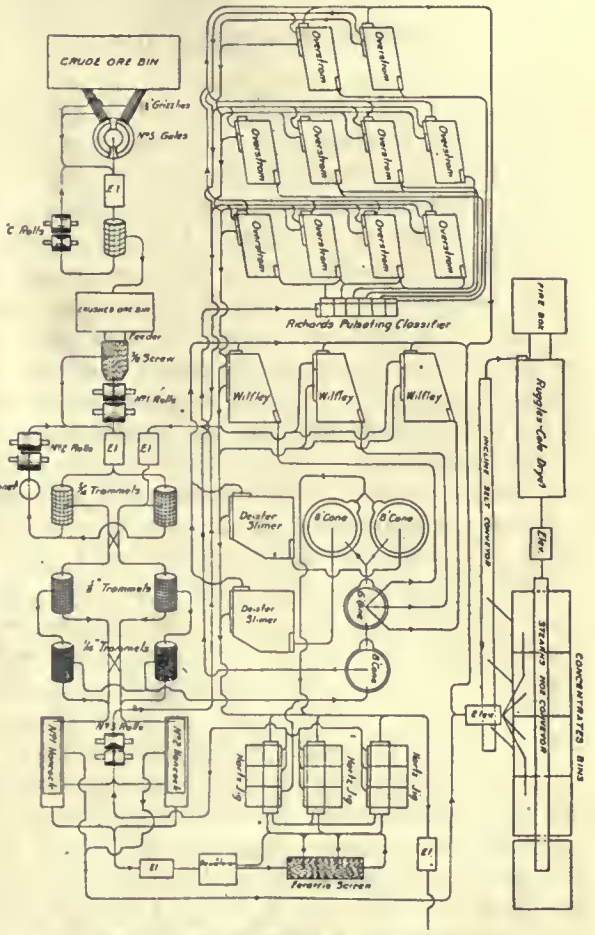
4. Pay the whole of your attention to your own work; never mind that of your neighbors, and work quietly, quickly, methodically, diligently, deliberately, observantly, thoroughly, and thoughtfully.

5. In general analytical and experimental work, (*a*) make careful and accurate notes of all experiments as you proceed. Do not continue until you have recorded the results of each experiment. When completed, use your notes for the correct statement of your work and for reference. (*b*) Avoid using great excess of acids and reagents, as besides causing numerous errors in your own work, you are overworking chemical manufacturers and salesmen. (*c*) During the later stages of an analysis, questions and doubts often arise, which can be settled with ease by the application of further tests to some of the filtrates, precipitates, residues, etc., obtained at earlier stages, if they have been preserved, and if not, confirmatory tests cannot be applied to materials which have been put down the sink. In other words, kindly remember the assay department is not a depot for the free distribution of sovereigns.

6. Attention to above rules will save much time, temper, trouble, swearing, annoyance, disappointment, repetition of work, and waste of material.

Cleaning Pyrite Ores

Pyrite ores, as they come from the mine, are not usually suitable for charging into furnaces immediately. They contain a certain amount of waste,



FLOW-SHEET, ST. LAWRENCE PYRITES CO. MILL.

and in addition much will be in lumps too large to be economically utilized in this condition. There does not appear to be any recognized standard scheme of sizing pyrite ores. The process of separating pyrite from gangue material such as quartz, calcite, and country rock is relatively simple, owing to the difference of specific gravity between the ore and waste. Where pyrite is associated with copper, zinc, and lead ores, the problem becomes much more complicated. The accompanying flow-sheet, taken from 'Pyrites in Canada,' by A. W. G. Wilson, shows the arrangement of a Canadian pyrite-dressing plant.

During the past nine months between 700 and 800 men have been employed laying a pipe-line for the General Petroleum Co. from the Midway oilfield of California to the Wilmington pumping-station, at Los Angeles harbor, a distance of 154.5 miles. The pipe is 8-in. diam., with a capacity of 30,000 bbl. per day, and within 30 days it is expected that oil will be pumped through it. A pipe-serewing machine was used in construction, and one mile per day has been completed at times. The weight of pipe used was 12,360 tons, while at each of the 14 pumping stations 317 tons of material was used. When in full operation, about 300 men will be needed. A branch pipe-line of 84 miles is also to be laid down from Gorman station to Tehachapi.

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Smelting Zinc-Copper Ores

The Editor:

Sir—It will, no doubt, be of interest to most of your readers to learn that a process has been developed for the successful treatment of ore containing too much zinc for the ordinary smelting practice, and not enough to be smelted for zinc in the old-style retort furnaces. Often such ore, usually sulphide, contains silver and gold with either copper or lead, or a small percentage of both these base metals. The presence of zinc makes it difficult and often too expensive to treat such ore for recovery of the other metals, whereas, the combined value of all the metals named, including the zinc, makes such ore very valuable. To illustrate this statement: Take an ore containing 50c. in gold, 6 oz. in silver, 55 lb. in copper, and 400 lb. in zinc per ton; at the present gross values, the gold, silver, and copper alone would be $12.05 per ton, but the zinc makes the ore treatment expensive by any ordinary method, and the zinc itself is worth $20.40 per ton if 85% is recovered into a marketable product at present prices, making the total value $32.45 per ton.

The ore I refer to and similar ore elsewhere cannot be concentrated by the comparative simple wet concentration methods adopted in the Middle Western states, on account of its large content of sulphides and the fact that it contains so little mineral that can be washed out. Magnetic separation appealed to me for the concentration of such ore, but proved a failure at the Afterthought, chiefly on account of the peculiar close-grained fine crystalline structure of the ore. The use of acids to dissolve the metals in the ore never did appeal to me, for the following reasons: The waste of acid caused by the formation of salts, due more especially to the lime, aluminum, and iron contents of the ore; the mechanical difficulties of handling such a pasty mass; and the difficulty of precipitating a pure zinc from the other metals which are in solution with it, the zinc being the most difficult and last metal to be precipitated. To make sure on these points I spent considerable time with others experimenting, with the above results, and other objections equally as serious.

The flotation process, which has proved such a commercial success at Broken Hill, Australia, will make a 45 to 50% zinc concentrate from the ore on which experiments have been made by men interested in the flotation process, recovering 85% of the zinc in this form, after a preliminary treatment. The concentrate would then have to be shipped to the regular zinc smelters near cheap fuel to be recovered and smelted in retorts where about 85% of the zinc in the concentrate can be saved. After all this expense has been incurred for the recovery of about 72% of the original zinc, the question arises, what has become of the copper, silver, and gold? My informant, who made the flotation test, stated that about 60% of these remained in the tailing and about 40% followed the zinc concentrate. This splitting up of the copper, gold, and silver makes them practically worthless. If they all remained in the tailing it would pay to smelt them, or if they would all follow the zinc concentrate, then there would be some profit in sending the cinder mixed with ash from the coal used in the retorts to a lead or copper smelting plant. If cheap coal could be obtained close to large bodies of such ore as I have described, the practice adopted at Joplin, Missouri, and at one time in Canyon City, Colorado, might suggest itself, but even then the loss in silver would be excessive, and the zinc oxide produced is not generally of good quality. The cinder from such oxidizing furnaces containing the remaining silver, copper, and gold with some zinc would have to be smelted in a suitable furnace by ordinary methods.

Having investigated nearly every known zinc recovery process, I will briefly describe a process that, while not suitable for the treatment of all ores containing zinc, especially those containing the zinc in the form of a silicate or too much arsenic, is suitable for the treatment of ore containing zinc with or without copper, lead, silver, or gold, all these metals being saved if present, by partly de-sulphurizing the ore, removing the zinc by leaching with ammonia and carbon dioxide, and smelting the sweetened residue, which is only 50 to 60% of the weight of the original ore, in an ordinary smelting furnace. The reduction in weight would depend mostly on the zinc content. It has been found to be 45 to 50% on a 20% ore, recovery of the zinc being 90 to 95% from a 35% zinc ore; 85 to 90% from a 25% zinc ore; 80 to 85% from a 20% zinc ore; and from a 10.4% zinc ore containing 2.1% copper, 6.5% lead, the extraction was 73 to 80% of the zinc. (I believe the average zinc extraction from the original ore in the United States is only about 51%.) The ammonia and carbon dioxide are distilled off in order to precipitate the zinc as a basic zinc carbonate. This precipitate is calcined to a zinc oxide, which it is found convenient to make chemically pure. The ammonia and carbon dioxide are used over again continuously, with practically no loss, except a slight mechanical loss in the residue to be smelted, which is found to average 0.6 to 1.4 lb. ammonia per ton of iron. The cost of treatment is not excessive. The elimination of the zinc and reduction in weight reduces the cost of smelting to a minimum for the recovery of the other metals in a reverberatory matting furnace (and it may be possible, in some cases, to treat the residue by cyanidation). The expense of crushing, grinding, and roasting the ore will be about the same as preparing the ore for any leaching method treatment, or cyanidation. The preliminary treatment to eliminate the zinc leaves nothing objectionable in the residue for smelting.

The details of this process I have promised to write up and read before one of the leading mining engineers' societies with the consent of D. Mosher, who suggested this process to me in the first place, as described by Schnabel in his 'Metallurgy of Copper, Lead, Silver, and Gold.' Vol 1, and F. L. Wilson,

who experimented for me with this and other zinc recovery processes at the University of California for several months before graduating in 1912, and has since worked faithfully developing the process on a larger scale. Many new ideas and improvements suggested themselves, differentiating it from the process as described by Schnabel after it had been in use for several years at the Hoboken works near Antwerp, where they must have had fused products and arsenic to contend with.

S. E. Bretherton.

Mine and Mineral Land Taxation

The Editor:

Sir—It would seem that this subject, so often discussed in the technical papers and magazines, would more properly come within the province of the political economist, but, as it is of such importance to the mine owners, mine managers, and the mining fraternity in general, it becomes necessary for all of us to delve into its mysteries and try to evolve some satisfactory solution of the difficulties attendant. It also appears as if there were as many different ideas of how the matter should be handled as there are persons interested, and it may happen that all of the present known orebodies will have been exhausted before a reasonable system of taxation is devised and adopted. Obviously, the simplest way out of the difficulty would be a general federal law, covering the method to be pursued in levying the tax, leaving the rate of taxation to the state, county, or district affected, the rate in each case corresponding to the general tax-rate on other property with an addition for federal purposes.

The whole matter has forcibly been brought to public notice through J. R. Finlay's article describing his methods in arriving at a valuation of the Michigan iron and copper mines for purposes of taxation for the state. Mr. Finlay evidently did the best he could in the limited amount of time at his disposal, but when we consider that the same amount of time is often consumed by an engineer in the examination of one property in arriving at its valuation for practice, I cannot see how the values given by Mr. Finlay are much more than careful guesses. In figuring the value of the mine, he takes into consideration the profit made, the dividend paid, and the period of time over which it can be continued; all of which is estimated from the best information available, and if wrong would work a hardship either on the mine owner or the state. Would it not be better to eliminate all valuation of property and all efforts of valuation and have a straight bullion or metal tax on the proceeds, either net or gross? The states interested are not always so fortunate as to secure a man of Mr. Finlay's attainments to perform this work, and the valuations are often left to men who know nothing whatever of mine values, thus forcing protests from the mine owners, lawsuits, and in general stirring up difficulties of various kinds.

Mining property differs from any other class of property. There is an unknown amount of mineral in the ground, the value of which is unknown until extracted. When extracted, the ground remaining is worthless unless it be suitable for other purposes. If available for other purposes before being mined it possesses a taxable value and should be taxed on that basis both before and after being mined. This should be a separate and distinct tax from the mineral tax.

The mineral value of land depends entirely on the profit that can be made in extracting that mineral. Then levy a tax on the metal when coming out and make certain of getting it some time on a basis that is absolutely correct and involves no element of guess-work. The improvements on the property are of no value except in connection with the extracting of the metal, and should not be subject to a separate tax. Let the bullion or metal taken out be the sole basis of calculation. It seems to me that no fairer method than this could possibly be devised. Why should the present generation load the succeeding generations with accumulating costs on mineral in the ground?

J. J. Hill recently made the statement, under oath, that the mineral lands owned by the stockholders of the Great Northern were worth $500,000,000, figuring the iron ore not available until extracted. Its valuation is in fact pure guess-work, and when ore is extracted by future generations they should have the benefits of it, unencumbered. A bullion or metal tax at that time would be the easiest means of collecting the Government's share of the proceeds.

Ore cannot be taxed but once without adding these accumulation costs, and if taxed at the time of extraction, no matter whether the selling price is high or low, it cannot escape its just proportion of governmental expense. In this connection, Dwight E. Woodbridge says in his article* concerning taxation by valuation of orebodies in the ground based on various methods of calculation: "Thus the tax value was placed over the entire orebody whether it could be mined in one year or in 50 years. It can be readily seen that after a property had been taxed on such a rate as this for 25 to 40 years there would have accumulated against the ore remaining in the ground a prepayment of taxes almost confiscation." It would be similar to $100,000 in coin lying in a safety deposit vault, drawing no interest and taxed at 3% per year. In 33⅓ years, the taxes will have equalled the entire principle with no return to the owner.

That this problem is not confined to metal mines alone is evidenced by the difficulties encountered in the taxation of coal and coal lands. The various assessors of Lackawana county, Pennsylvania, have had almost as many different methods and different values in taxing the coal lands, as a number of assessors. An article in the *Engineering and Mining Journal*, July 4, 1908, says in reference to this: "This wide difference is only another instance of the lack of any just or uniform basis for the assessment of mining property."

I have yet to see a mine owner or operator who is

*"Iron Mine Assessments in Minnesota," *Eng. & Min. Jour.*, November 23, 1907, p. 967.

perfectly satisfied with the method or methods of taxation. Quite recently the question of taxing patented claims in Nevada has been discussed in the *Mining and Scientific Press.* Under my interpretation of values this would be a very simple matter. No tax should be levied until the property is working and producing. When the metal comes out, make the property pay its just proportion. When it ceases to produce, stop taxing. If the trouble so often mentioned of large areas of ground lying idle after patenting arises, amend the present law and make it necessary to still do a specified amount of assessment work on each claim per year to hold title, just as it is necessary now to use water for some useful purpose to hold title. It might also be a good plan to limit the number of claims that any one person or corporation can locate at one time, the same as a homesteader is limited in the number of acres of agricultural ground he can take up. All vacant mineral land is supposed to be owned by the federal Government, and, as I said in the beginning of this article, it seems to me just and proper that the best method of handling the taxation of this mining property is by a general federal law, uniform in its provisions as to the method to be used, leaving the amounts to be collected to the various states as their necessities demand.

H. C. Cutler.

Reno, Nevada, March 19.

Concentration by Flotation

The Editor:

Sir—In your issue of February 15, your correspondent, Edward Walker, supplements his article of January 4 with an addition which appears to call for further correction; perhaps a few facts from one who was intimately associated with the processes mentioned may be of interest.

In the first place, Theodore J. Hoover would be the first to admit that he did not, as might be inferred from Mr. Walker's addendum, introduce into the Minerals Separation process the factor of *rapid* agitation, in connection "with the virtue of the smallness of the amount of oil." This also originated with Sulman, Picard, and Ballot, and was an integral part of their process from its inception. Mr. Hoover became connected with Minerals Separation, Ltd., at a later date.

In the second place, the credit for this rapid agitation cannot be assigned to J. D. Wolf; my firm designed for him the apparatus arrangements employed to give effect to Scammel's viscous-oil flotation method, wherein a large mass of chemically thickened oil was employed.

If rapid agitation (that is, of the order used by Minerals Separation) had been given to the Scammel (Wolf) mixture of thick viscous oil, water, and mineral, the result would have been an inseparable sludge or 'mush,' and the defeat of the whole object of his process. The type of agitation which Mr. Wolf used and for which we were mainly responsible, was that afforded by a 'Johnson mixer'; this gently broke the large mass of oil into globules of appreciable size, temporarily suspending them in the pulp in order to entrap in their substance any metallized particles with which they might be brought into contact. Thereafter these rose through more quiescent liquor to the surface by means of their residual buoyancy and coalesced into a thick stratum of floating oil with embedded mineral; this was then removed for the recovery of its metallized contents, the oil being returned to the mixing apparatus for re-use. In no sense did the Wolf agitation approach that of Sulman, Picard, and Ballot, and as one of the designers of both types of agitation, which were selected for diametrically opposed functions, I may claim to have some authoritative knowledge of the matter. Theodore J. Hoover's undoubted contributions to the development of Minerals Separation plant were in the direction of improved arrangements for combining the agitation boxes and spitzkasten, instead of retaining them in the separate form at first employed. I should be the last to wish to minimize the value of his work, which has been justly acknowledged in public by the chairman of Minerals Separation, Limited.

London, March 5. H. Livingstone Sulman.

Surplus of the Average Man

The Editor:

Sir—That the tendency of the times is beginning to tell on the industry of which your journal is such an able exponent is clearly indicated by your editorial, 'Blue Sky Legislation and Investors,' appearing in a recent number, in which you say that "It is to the accumulations of the average man that industry must look for capital for expansion." This is far from correct. The average man makes many times more, but gets less than $500 per year. It is to those who have appropriated his surplus that industry must look for capital for expansion.

San Francisco, March 29. R. E. Hegner.

Bureau of Mines Appropriations

The appropriations provided by the sundry civil appropriation bill for a Bureau of Mines were as follows:

General expenses	$ 70,000
Investigation of mine accidents	347,000
Testing of coal and other mineral fuels	135,000
Investigations, mining, and treatment of ore	100,000
Mine inspector, Alaska	3,000
Mine inspector, Alaska, expenses	3,500
Books and publications	1,500
Railway sidings for mine-rescue cars	2,000
Total	$662,000

In addition $500,000 was appropriated for much-needed buildings at Pittsburg, and provision was made for a new building at Washington to house the Geological Survey, Bureau of Mines, and related organizations. While the bill was vetoed, it will probably be passed at the present session of Congress substantially without change.

Platinum and palladium amounting to 3000 and 5000 oz., respectively, were recovered in refining copper matte at Sudbury during six years ended 1912.

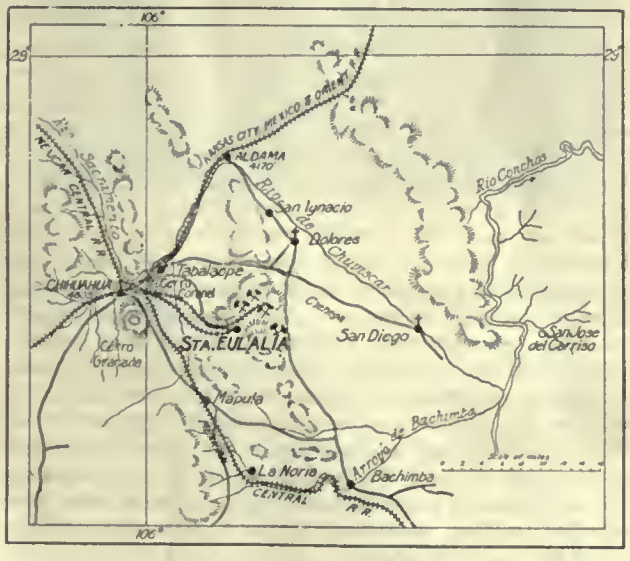
Special Correspondence

LONDON

LANYON OUT OF CORNISH TIN.—EXPLORATION COMPANY MEETING.—MYSORE CONTINUES TO BREAK RECORDS.

About a year ago I recorded that one of the tin smelters in Cornwall, the Bolitho's, at Chyandour, Penzance, had gone out of business, and that the works had been closed. This week I have to record the severance of another famous name, Lanyon, from the Cornish smelting industry. It is about 40 years since Alfred Lanyon founded the works at Carnkie, near Redruth, with a partner, and called the business the Cornish Tin Smelting Co. For the past 25 years he was the sole owner. But with his retirement the business itself does not cease, for it has been sold to Vivian, Younger & Bond, a London firm of metal merchants, who have other tin-smelting interests, notably in the Malay Peninsula, where they are active in connection with the Eastern Smelting Co. Under their ownership the routine at Redruth will be undisturbed. For many years William Bray has been manager of these works, and recently he has been assisted by his sons Richard and Hubert. Mr. Lanyon's purchases of Cornish concentrate at the ticketings have averaged £300,000 in value, and probably about twice as much black tin has been purchased from abroad.

The Exploration company, being devoted to speculation as well as investment, does not publish an elaborate report or balance sheet, but the chairman, R. T. Bayliss, gives a comprehensive review in his annual speech to the shareholders. The company's interests in Mexico are connected with mines within their own control. Mr. Bayliss was able to report that recent exploration at the El Oro had brightened the prospects, and that the purchase of additional adjoining property had increased the life of the mine. The Buena Tierra silver-lead mine, in the Santa Eulalia district of Chihuahua, was reported to be developing well, but owing to the revolutions, the Chihuahua smelter, which buys the ore, had not been running regularly, so that the Buena Tierra company had suffered severely. The latest



SANTA EULALIA DISTRICT.

flotation by the Exploration company has caused worry through metallurgical difficulties. This is the Santa Rosa, a gold-silver property in the Mazapil district of Zacatecas. A year ago a 100-ton plant was ready to begin production, but the ore has proved refractory, and experiments are being conducted by W. K. Betty with the object of solving the problem. One of the strong points of Mr. Bayliss is that he does not shirk responsibility for mistakes or miscalculations. In referring to the Santa Rosa, he said: "When I addressed you last year, I said this mine, as from January 1, 1912, would be earning a profit of £40,000 per annum. Subsequent treatment difficulties have proved me hopelessly wrong in that prediction." As regards copper, the holdings of the Exploration company are in American companies outside its own sphere of influence, and partake of the nature of speculative interests, so the directors' report does not enter into details; but Mr. Bayliss stated that the future of the copper market was so encouraging that they intended to extend their activities in this direction. The Exploration company has £250,000 in liquid capital, available at any time for the acquisition of additional properties and mines.

The original mine in the Kolar district, the Mysore, continues to be the most important, and continues on its uninterrupted way, still breaking records after a life of 28 years. The yield of gold for 1912 was £904,079, just a trifle better than the previous highest in 1909, 1910, and 1911, and bringing the total since the start to £14,376,720. The amount distributed among shareholders was £381,250, or at the rate of 125%. This is not actually the highest dividend, for during the years 1904 to 1908 the distribution averaged £40,000 more; but it has to be remembered that in those days the money for extra equipment and the sinking of new shafts was obtained by the issue of new capital. The mine continues to respond to development, and during the year the reserve has been increased by 37,629 tons, standing on December 31 last at 1,337,998 tons, or four years' supply. Much money is to be spent during the next two or three years on the further sinking of the Edgar and McTaggart vertical shafts, and also on tube-mills and cyanide plant for treating the accumulated sandy tailing. Negotiations are in hand for the acquisition of additional ground on the dip from other holding companies belonging to the same group.

NEW YORK

MORGAN'S DEATH.—COPPER SITUATION.—GREENE-CANANEA CLOSES.—MIAMI REPORT.—B. C. COPPER CO.—SHATTUCK-ARIZONA.—BUTTE NEWS.—PRICE OF SILVER.

In spite of inherited wealth and not because of it, Mr. Morgan achieved the greatest constructive career as a financier and organizer this country has ever seen. His grasp of details, his power to enthuse and create or bring out loyalty, his abiding faith in the future of himself, of his country, of the industries for the upbuilding of which he worked, were all grounded upon his adamantine conception of business integrity. He was gruff, and grim, and brusque, but he was undeviating, and in time of stress he was the restful harbor sought by all the craft of Wall Street. That he made himself one of the greatest art connoisseurs in the world, that his vast collections of art treasures show taste and rare discrimination, is but another evidence of the greatness of the man as set over against the greatness of the dollar. The leadership, the capacity, the great faith, and his inspiration of confidence will be remembered and discussed in Wall Street long after the memory of the millions he may have amassed shall have passed away. Mr. Morgan's passing marks an epoch in the financial history of the country; the next generation will not see leadership so unanimously accorded to any one individual. There will, in the next few years, be seen some strenuous competition for the first place in banking affairs, but such competition is almost certain to be institutional rather than individual, and Mr. Morgan's mantle, instead of descending to a new leader, will in all probability be hung in the gallery of Wall Street memories to be pointed out as an illustration of the greatness men sometimes achieve.

In the copper situation the encouraging feature is the record made in the export trade during March, it being quite assured now that March exports will equal if not excel those of December 1911, when the total outgo was 84,504,000 lb. Custom House figures for March show nearly 90,000,000 lb. to have been exported in March, but some considerable portion of this copper was accounted for in the February figures of the Copper Producers' Association. It is safe to predict a decrease in copper surplus somewhere between 10,000,000 and 15,000,000 lb. This showing will be offset a little by increases reported in the visible supply abroad; recent fortnightly figures showing an addi-

tion during the last half of March of 1435 tons, equivalent to 2,870,000 lb. The copper selling agencies feel so far assured of the improvement in the situation as to have advanced prices to 15⅝c., and some of the heavy sellers are already talking about 15½c., and in one instance one of the principal sellers of copper has withdrawn entirely from the market at present prices.

In illustration of the old adage that "one man's meat is another's poison," the copper situation is improved by the enforced shut-down by the Greene-Cananea, the management having wired to the local offices in New York that "it will be necessary to close down the blast-furnaces and suspend all operations until the situation clears up." The railroads have been destroyed and bridges burned, so that it has been impossible to get fuel and supplies into Cananea. This shut-down means a curtailment of about 9,000,000 lb. of copper per month. The report of the Miami Copper Co. for 1912 is just available. It shows that the company sold during the year 32,477,923 lb. of copper at an average price of 16.58c. per pound, from the production of which there was won a net profit of $2,029,765. Copper costs are not given in detail, but J. Parke Channing says, in his report as consulting engineer, that mining costs have remained high on account of unusual development work done to get the ground ready for stoping. One part of the property is now in shape for stoping and a materially reduced copper cost may be expected during the coming year. The March production of the Phelps-Dodge company was 12,261,538 lb. of copper, being a slight increase over the February output.

The report of the British Columbia Copper Co. covers the 13 months ended December 31 last, during which period there was produced 11,259,140 lb. blister copper, yielding 25,863 oz. gold, 142,025 oz. silver, and 11,146,811 lb. fine copper. The chief handicap under which the company has labored during the past year has been the low metal content in the ores handled. The rehabilitation of the plant has made operations much cheaper than formerly, but notwithstanding this, copper costs for the period covered were 12.85c. per pound. British Columbia has some extensive plans for expansion under way, and the coming year will see some new properties opened and larger ore reserves created, which plans, if carried out, will give stability to the company's future. At the annual meeting held this week, Frederick Lewisohn, Harry Bronner, and John H. Seaman resigned from the board of directors, their places being filled by Joseph B. Dulany, C. I. Straiem, and William T. Henry. The somewhat meteoric career of the Shattuck-Arizona is to be interrupted by the suspension of the dividend of 50c. per quarter which it has been paying recently. The company has a contract to deliver 500 tons of ore per day to the Calumet & Arizona smelter, shipments on this basis to begin on July 1. The management has decided that in order to prepare for these shipments it will be necessary to expend the company's present revenues in development instead of making distribution to the stockholders. So far as can be learned the various deals which were afoot for the purchase of the Shattuck-Arizona by some of the larger copper producers have all fallen through.

Evidently the Butte & Superior people and W. A. Clark are not to have the zinc industry at Butte altogether to themselves. It is reported that the assets of the LaFrance Copper Co., which include the Lexington mine and the old smelter and concentrator at Basin, have been sold to the Anaconda. The LaFrance Copper Co. was known for many years as a Heinze organization and was a part of the tangled affairs of the United Copper Co. W. F. Bartholomew, formerly a member of the staff of the *Boston News Bureau*, and E. N. Skinner, both now a part of the Thompson-Towle organization, are leaving New York this week for a two months' trip, during which they will visit nearly every important copper producing property in the country. The U. S. District Court appointed additional receivers this week in the suit brought by the Guaranty Trust Co. of New York against the Alaska Ebner-Gold Mining Co. This property appears to be a little unfortunate in that it is continually involved in litigation or reorganization.

It seems rather a far cry from the recent action of the President in announcing his change of policy toward the participation of American bankers in the so-called six-power loan of $125,000,000 to China, to the price of silver, but as a matter of fact the President's action has given the silver market more of a set-back than anything which has occurred since it began to look up. The market in silver has been maintained upon the theory that eventually negotiations for the loan would be brought to a successful close. Now silver held for Chinese account, looking forward to such a conclusion, is pressing heavily for sale, while at the same time the Indian government is no longer in the market for coinage, the net result being a rather depressing outlook for silver producers.

MIAMI, ARIZONA

SUPERIOR & BOSTON.—ARIZONA COMMERCIAL.—IRON CAP.—WARRIOR.—SOUTH LIVE OAK.—CALUMET & ARIZONA.—MAGMA.

At the Superior & Boston, plans are being formulated for a greatly increased tonnage in the near future. A favorable contract has been entered into with the American Smelting & Refining Co. at El Paso, Texas, whereby the latter is to handle all the Superior & Boston ores for a period extending over the following two years. Driving on the east and west drifts on the 600-ft. level has extended over 200 ft., while the raise from the eighth to the sixth level is expected to break through within the next week. The cross-cuts on the tenth and twelfth levels show geological changes interpreted as indicative of nearness to the main lode. The present shipments of a car per day are being maintained. The Arizona Commercial continues to carry on an active program of development. Operations at present are confined to the Copper Hill shaft. Sinking is being carried on, the shaft having now reached a point below the tenth level. A station is being cut on the tenth. Driving continues on the seventh and eighth. On the seventh a drift is being driven for the purpose of handling the ore previously found. The highly favorable developments at the Superior & Boston may lead the company to resume operations near the old Eureka shaft.

At the Iron Cap the recent discoveries on the 650 and 800-ft. levels remain promising. The raise from the eighth to the 650-ft. level is now in over 30 ft., and continues to disclose ore of a commercial grade. The find on the 650-ft. level also holds out. The shipping rate of four cars per month to the El Paso smelter is being maintained. During the month of March the Gibson Copper Co. shipped five cars of ore to the El Paso smelter. The company expects to again reach normal shipping capacity during April. About 40 men are employed. At the Warrior Copper Co. steady shipments of from 125 to 150 tons of silicious copper ore are being made daily to El Paso. The ore is freighted by teams to the Warrior siding on the Arizona Eastern about two miles below Miami. Between 50 and 60 men are employed. At the South Live Oak, drilling operations are progressing satisfactorily. Hole No. 7 has now reached a depth of 805 ft. and is to be discontinued. The new hole, No. 8, lies about 750 ft. northwest of No. 7, and about 400 ft. west of hole No. 5, the hole in which 65 ft. of over 2% ore was found. A series of unavoidable accidents have been retarding drilling operations at the Southwestern Miami during the past two weeks.

The two main shafts of the C. & A. at Superior, that are being sunk on the Morris lode, are respectively 200 and 135 ft. deep. John A. Greenway, general manager, states that no ore of a commercial value has as yet been found and that the company has no expectation of finding any at the present depth. The shafts are at points convenient for working, not on account of any special geological reason, and active exploration will not be undertaken until a depth of 700 ft. is attained. At the Magma, extensive exploration is being carried on by diamond-drilling. An 800-ft. horizontal drill-hole running in a southerly direction has just been finished, while a second perpendicular one has attained a depth of 300 ft. Results are proving highly favorable. T. I. Ryan has charge of the drill work, and is using a Longyear & Hodge machine of a 2000-ft. capacity. The

company continues to make shipments of 100 tons of high-grade ore per week by way of Florence to El Paso. About 25 men are employed at present underground. A good find of high-grade ore was recently made on the Whitlaw-Brown claims. These claims lie about one-half mile southeast of the famous old Silver King mine. Lessees on the Horn Silver claim, which lies one-half mile northwest of the Magma, are taking out considerable high-grade ore, having already made one shipment.

REPUBLIC, WASHINGTON

RAILWAY NEWS.—KNOB HILL MINES.—SILVER REEF.—NEWS FROM OKANOOON.—OWASCO MINE TO BE REOPENED.

The Great Northern Railway Co. has announced the release of its right of way through the San Poil valley, which leaves clear the right of way for the extension of the Spokane & British Columbia railway from Republic to Spokane, down the San Poil valley and along the Columbia and Spokane rivers. The consolidation of the North Washington Power & Reduction Co., the Republic Mines Corporation, and other interests at Republic has been effected, according to advices from Spokane, and a new company called the Surprise Consolidated Mining & Milling Co. organized. The Republic Mines Corporation receives 1,000,000 shares in the new concern, and the North Washington gets 300,000 shares, the balance being held as reserve. Their combined liabilities are $306,000, and the only obstacle to the consolidation is the possible action of creditors. The Republic company owns the Lone Pine, Pearl, and Surprise mines at Republic, while the North Washington company owns the

REPUBLIC, WASHINGTON.

reduction works there, and was organized primarily to provide treatment facilities for the other company. If the business goes through, the mill will be enlarged, and costs should be reduced. The output of the Knob Hill mines at Republic, which for three or four months had been reported as rather slim, has improved recently. Under date of March 26, the returns for the smelter at Trail, B. C., from 53,501 lb. of ore gave the assay value at 6.20 oz. gold and 20.2 oz. silver, and the net value, after deducting freight and treatment charges, at $119.74 per ton. The total amount allowed was $3203. Five other shipments of somewhat similar value are to be heard from. The ore from the Lone Pine and Surprise mines is not only paying expenses, but is also rapidly building up a reserve to pay off all of the labor claims of the miners standing against the Republic Mines Corporation. T. Roberts, of Sheridan, Wyoming, has taken a bond on the Silver Reef group of claims, in the Enterprise mining district, and will organize the Held-Roberts Mining Co., and push development on a 23-ft. vein in which have been found rich streaks of sulph-antimoniate silver ore, which show in the forms of ruby silver and stibnite.

G. W. Dart, president and general manager, and C. W. Smith, secretary, of the Owasco Gold Mining Co., a New York corporation, are at the Okanogan Free Gold mine, on Kruger mountain, west of Oroville, preparing to start up work. About $140,000 has been expended on this property by a Canadian company. The old openings embrace about 2700 linear feet of adits, drifts, rises, and stopes. There are four veins, of which one has been extensively developed and the others barely prospected. Internal dissention in the company resulted in suspension of operations. The new company will put in a compression plant and re-timber the mine. A contract for electric power has been made with the Similkameen Power Co. A vertical shaft will be sunk and new levels opened. The work will be started with a force of about 30 men. Mr. Dart estimates that there is enough ore in the drifts and stopes in the mine for a year's supply for the 10-stamp mill, and about 30,000 tons of $20 ore on the dump. The track of the O. C. & E. railway traverses the property within 600 ft. of the mill. The Ivanhoe mine on Palmer mountain, which has been idle for several years, has recently been under examination for an Eastern syndicate. The shaft on the Ruby mine, at Nighthawk is now down 750 ft. There is now developed on this property enough $15 to $20 ore to keep a 30-ton concentrator running two years.

JOHANNESBURG, TRANSVAAL

ADDRESS OF RETIRING PRESIDENT OF CHAMBER OF MINES.—INCREASED COSTS.—VALUE IN DEPTH.—ROCK DRILLS.—WHITE LABOR.—ELECTRIC POWER.

The retiring president of the Chamber of Mines, M. G. Elkan, had much to say that was interesting regarding the mining progress made during his year of office. Referring to the Rand, a much larger tonnage had been mined and milled in 1912 than in any previous year, and although working costs had increased, the recovery per ton was higher and so were the working profits and dividends. The recovery was higher partly through improved methods of extraction, but mostly owing to a better grade of ore having been sent to the mills. With regard to higher working costs, unnecessary competition among the mines had raised the cost of native labor, but, fortunately, during the year a system of coöperation had been arranged, and native labor costs ought in the future to be reduced. Then extra burdens have been imposed, especially in regard to miner's phthisis, but underground conditions had been so improved that it is expected that this new burden will be of a temporary character only. Over two thousand cases of application had, however, been put in for relief under the Miner's Phthisis Relief Scheme, of which only two-thirds had yet been adjusted. The annuities already awarded under the Act amounted then close upon £300,000. As far as could be seen at present, the cost to the mines for this relief varied according to circumstances from 3d. to 9d. per ton milled, so that on the average it may be as high as 6d. per ton. Against this might be set the reduced railway rates and native wages, so that in the long run, working costs may be expected to come down to the old figure. Much importance was attached by Mr. Elkan to better ore exposed at the deepest workings at Geduld, Modderfontein, Cinderella Consolidated, City Deep, Crown Mines, Consolidated Main Reef, and Princess Estate, and taken as a certain cause for encouragement. In case of at least three of these illustrations, however, the reef has only just been found, and true values over an extended area have not yet been established, so that it is premature to attach much importance to these finds. Take Geduld, for instance; where phenomenally rich ore in both shafts and boreholes have been found, it has always been difficult to establish them even when confined to the shaft, the second sampling failing to confirm the first high values, so that Geduld was an unfortunate example to cite. At the Consolidated Main Reef, too, the development results of the past three months, where 2321 ft. was driven, raised, and sunk, only about 30% of the footage was through profitable ore, which is far more convincing than the mere finding of a reef by a shaft, close to a dike at that. The Crown Reef instance was apparently one of abnormal local development, but the other instances quoted are more convincing and satisfactory. Reference was made by Mr. Elkan to the success attending the use of small stoping drills, the total number of rock-drills having increased

from 2425 in 1908 to 5530 last year, and there is now every prospect of the quest of a satisfactory stoping drill for all local underground conditions being discovered. Stores consumed last year aggregated £9,753,751, European wages cost £7,865,939, and native wages £5,691,401, white wages having averaged £330 per head throughout the year. Nevertheless the supply of white skilled labor on the Rand was far below requirements, the bulk of the white labor engaged in supervising the negroes and underground mining operations being very inefficient and therefore costly. Native mortality, including accidents, had been reduced from 34 to 28 per thousand during the year, while special efforts were being made to reduce the deaths from pneumonia, particularly among the tropical natives. The marked extension of the use of electrical power on the Rand during the year was next mentioned, the Victoria Falls Power Co. having in five years increased its plant capacity from 5700 to 94,000 kw., and soon the total capacity will be 140,000 kw. electric power and 61,500 kw. air-compressing plant, all supplied to the mines by one company. Three individual mines have also their own large power plants. In conclusion, Mr. Elkan said that the mining industry of the Rand possessed great inherent soundness, and that the average value of the residue did not exceed 1s. 6d. per ton.

BUTTE, MONTANA

SOUTHERN CROSS READY TO SHIP.—BUTTE CENTRAL.—CORBIN BRANCHING OUT.—GOLD PRODUCTION INCREASES.

The Southern Cross mine at Georgetown, which was purchased some time ago by the Anaconda Copper Mining Co., is about ready to begin shipments on a large scale. The new electric hoist and steel head-frame are about finished, and the mine has been put in shape for steady production. The oxidized gold-copper ore from this mine makes a desirable flux for the silicious sulphide ores from Butte. Tuolumne Copper Co. will pay its regular quarterly dividend of 10c. per share on May 15. Local stockholders of

PART OF BUTTE.

Butte Central Copper Co. are seeing stars these days since the stock has declined from $8 to $2 per share. Everybody seems to be wondering what has happened. The mill seems to be there ready to treat ore in good shape, and the surface buildings are intact. Somebody says that somebody sent an engineer to see if the ore was there, which ore said engineer said he failed to find. Since which time the said somebody has been regarding his stock with aversion, and unloading it on the still hopeful insiders at any old price. The Butte gullibles are now wondering just what caused them to buy the stock, and are sagely remarking that mining is still a horrible gamble. The Corbin Copper Co. apparently does not believe in putting all its eggs in one basket. The company is experimenting with four properties now, one at Corbin, one at Elkhorn, one at Rochester, and one at Butte. No egg has hatched yet, although the stockholders lost $62,502 last year in trying to keep the basket warm. The east section of Butte is still attracting capital. The latest venture there is the Butte Main Range M. Co., organized by the controlling interests of the Tuolumne and Pilot-Butte companies. The new company is capitalized for $1,500,000, and owns 45 acres of mineral ground east of the Pittsmont property. For development purposes, stock is to be offered at par. The directors of the new company are: Ed Hickey, Ed. Hickey, Jr., P. J. Brophy, Frank X. Girard, Ray J. McDonald, M. S. Largey, C. R. Leonard, Pat Sheehan, and J. J. Harrington. A shaft will be sunk in search of copper. The revival of operations by the Barnes-King Development Co. again throws Fergus county into the lead of Montana's gold counties. The United States Assay Office at Helena reports the Montana gold production for March at $116,000, of which Fergus county yielded about $42,000, mostly from the Barnes-King property. Next in importance is Madison county, with $37,000, mostly from the Alder gulch dredges. The Marysville mines produced most of the $22,000 from Lewis & Clark county. Choteau county furnished about $14,000 from the gold properties in the Little Rockies. No other county is credited with as much as $1000. In spite of persistent rumors that all is not lovely with the copper leaching plants on the east side, the promoters of these enterprises are going ahead enlarging their plants, and raising money for more extended operations. Somebody must be mistaken. Let us hope that it is the critics of the method, for the sake of the stockholders who have their money at stake. The Butte & Superior Copper Co. is going quietly ahead with the development of its ground and the improvement of its zinc mill. From all accounts, progress appears to be satisfactory. The long north cross-cut from the Black Rock to the Colonel Sellers shaft on the 1200-ft. level is to be continued on north to prospect the Mastodon and other veins of that section.

BOSTON

OLD DOMINION.—CORBIN.—BUTTE CENTRAL.

The first of April, Godfrey Hyams secured from the District Court of Portland, Maine, an injunction restraining the Old Dominion company of Maine from voting its stock in the Old Dominion company of New Jersey. The court order permitted only the voting of the New Jersey stock on the question of adjournment. The Old Dominion company of New Jersey therefore adjourned its meeting out of respect to the court, though it did not concede its jurisdiction in the matter. The hearing on the injunction proceedings will take place on April 14 at Portland, Maine. R. M. Edwards, the veteran Michigan mining man, father of the drill system, is now at Butte, looking after the interests of the Corbin Copper Co., which is making payments on the Gambrinus claim in Butte. The Corbin interests propose to open the property at once by shaft sinking. Mr. Edwards believes that the Gambrinus claim carries the extension of the Anaconda-Parrot vein. The United States Smelting interests, of Boston, are now supporting Mr. Edwards in his handling of the so-called Dow-Edwards properties in the Lake country, and it is presumed that their reports will also extend to the Corbin enterprise.

A sensation, if not a near-scandal, has developed here over Butte Central. A raid was made on the stock, which carried it down from 5⅜ to 1½, closing around 2⅜, which is about its average price at present over a period of days. The occasion of the raid was a report made by Samuel H. Treloar, stating that the mine, instead of having a million or more tons, has 35,000 tons from the 100 to the 300-ft. level and 3000 tons on the 300-ft. level, making 38,000 tons in all. Many angry controversies and ugly charges have arisen. The vice-president, Mr. Davison, claims that a Curb firm here made an effort to levy blackmail upon him by offering to turn the report over to him, squelching it and giving the mine a clean bill of health for a consideration. He refused and the smash came. Witnesses were lacking, so Mr. Davison could not press blackmail charges. This leaves the disparity between Butte Central claims and Treloar's estimate of ore reserves to be reconciled. The Butte Central interests claim that no misrepresentation has been made and that the mine has been done a very great injustice by Mr. Treloar. The claims as to Butte Central ore reserves are based largely on statements made by Mr. McConnell, mine superintendent, and John E. Rothwell, mill engineer, who have credited it with 1,500,000 tons. Other experts who have visited the mines have in a casual way confirmed the Rothwell-McConnell estimates.

General Mining News

ALASKA

Fairbanks

Four inches of a vein carrying up to $2000 per ton has been found in the Homestake property on Wolf creek. It was cut 315 ft. from the mouth of the main adit. The total width of the vein is 12 in., and the other 8 in. averages $40 per ton. The last shipment to the mill returned $77 per ton. Miners on Fairbanks creek are getting ready for the coming season.

Iditarod

The Idaho 'association,' at the head of Flat creek, which was recently optioned to T. Aitken, was purchased from the original owners for $20,000. Rich 'pay' was found during March. An eighth interest in the Upgrade 'association' was also purchased for $15,000, while the balance was sold for $32,000.

Valdez

The Thompson-Ford company, at Shoup bay, has driven an adit 600 ft. during the past six months, and also a raise for ventilation. Two veins, 14 and 24 in. wide, have been opened.

ARIZONA

Gila County

(Special Correspondence.)—Nevada people are working a fine property, belonging to Sam Thorpe, under lease and bond. They have a shaft down 50 ft. and have made one shipment of ore, from which they received good returns. Good ore containing gold, silver, and copper is being taken from a property adjoining the old Silver King mine north of Globe. The new owners of the Silver King mine are preparing to begin work on that famous old property. Several lessees are working in the vicinity of the King, and prospectors are quite active. The Magma Copper Co. is continuing the development of its property, and shipping between 300 and 400 tons of high-grade ore per month to El Paso. The force employed has been reduced temporarily, on account of the recent wet weather, which damaged the roads, and also because of the increased flow of water into the shaft, which is difficult to handle, as the capacity of the compressor has been reached. Development in the Magma continues to be favorable, and at the 800-ft. level the ore is even richer than it is on the upper level. The company is prospecting with diamond-drills, with the object of locating a working shaft.

Globe, April 2.

Ray Consolidated produced 4,420,000 lb. of copper in March, making a total of 12,312,000 for the first quarter of 1913.

Maricopa County

(Special Correspondence.)—William Dilthey, president of the Copper Belt Mining Co., has returned from his home in New York and is at the property in the Black Rock district. The company will resume operation on a large scale soon. One of the properties of the company joins the Monte Cristo, and another adjoins the Keystone.

Wickenburg, April 2.

Mohave County

Rich ore has been opened in the Boundary Cone mine, near the Tom Reed. It is reported that another gold discovery has been made in the Wallapai mountains, 18 miles south of Kingman.

Pinal County

(Special Correspondence.)—Mr. Guild, manager for the Tortolitas Copper M. Co., is making preparations for a resumption of work in the Yankee Girl shaft, which is now 100 ft. deep. He has enough lumber on hand to timber the shaft to a depth of several hundred feet, and is framing the sets for the first 100 ft., so as to expedite the work when he puts on a crew of timbermen. The Yankee Girl mine has yielded exceptionally rich ore in the past, which was shipped to El Paso and yielded the owner a large return in gold, silver, and copper. This ore was taken from near the surface, where it had been subjected to leaching. The new shaft will have a 6 by 6-ft. hoist-way and a 2 by 6-ft. man-way, and pumping compartment. The hoisting engine and blower have been moved from the Cloudburst to the Yankee Girl shaft. It is of 500-ft. depth capacity.

Florence, April 2.

Yavapai County

The Crown King mill has ceased treating the old tailing dump of that mine until weather conditions moderate. The deep snow, together with the cold days and nights,

MAP OF ARIZONA.

in that elevation, were a great disadvantage, and resumption will not take place before the end of the present month.

Prescott, April 2.

CALIFORNIA

Amador County

The shaft of the old Keystone mine has been sunk to 2600-ft. depth, the last 1000 ft. having been sunk during the past 10 months. A station is to be cut at 2600 ft., and a cross-cut driven 400 to 500 ft. west to cut the vein, which produced rich gold ore in the old workings. This property is stated to have yielded $17,000,000. The gold-mining industry in and around Jackson and Sutter Creek is said to be in a flourishing condition.

Butte County

The California Diamond-Drill & Engineering Co., which has been operating near Magalia, has pulled up its drill and gone to Chico. Only one hole was drilled, to 404-ft. depth, and the hole started and ended in a serpentine rock. Local miners state that there was no chance of finding a gold-bearing channel there, and another object was in view. The power-line from De Sabla to the Crystal Hill mine has been completed, and all connections made.

Calaveras County

(Special Correspondence.)—The Springfield Tunnel & Development Co., situated about two miles from Columbia and a half-mile north of Springfield, is doing extensive work on its property. This company owns about 500 acres of ancient river channel at Table mountain and has spent considerable money in underground work that will enable the handling of a large volume of water at a minimum of expense, and also reach the gravel in the cheapest manner possible. This channel is a part of the ancient river system which crosses the country from the northeast and, as far as known, terminates in Tuolumne county. This company made a record in sinking its new

shaft, which is of three compartments with square-set timbering. The work started on February 25 at 7 a.m., and on March 27 at the same time, 30 days later, the shaft was down 195.5 ft. and completely timbered. Twelve men were employed, four men to a shift, and two more framing timbers. The shaft men did all the necessary work of timbering and 'mucking,' using a 1-ton skip in handling the rock. Two Damas machine-drills were used. An adit is being driven in from the mill to the new shaft, and will be about 700 ft. long, connecting with the new shaft 180 ft. above the channel. This will facilitate the handling of the gravel as well as supplying the water which will be used in the mill. Mr. Homer, the superintendent, thinks he has solved the problem of handling the water. He is now installing a pump which will handle about 1500 gal. per minute. The equipment throughout is modern, being electrically driven.

Angels Camp, April 3.

Eldorado County

Considerable mining activity is reported in the Fairplay district, and good results have been obtained in working the old river channels.

Humboldt County

(Special Correspondence.)—The Horse Mountain Copper Co. is doing considerable development at its property. One adit is in 300 ft. and has opened sulphide ore and a good deal of native copper. A lower adit is in 600 ft. In the New river district there is 5 ft. of snow.

Eureka, April 5.

Nevada County

The Grizzly Ridge Mining Co. is developing the Oustomah quartz mine, near Nevada City, and also the Oak Flat and Eddy properties. A full account of the North Star operations during 1912 appears in another column. A large dredging plant is to be built on Deer creek, under the direction of Frank Porter. The dredge will be 40 by 60 ft., and will move about on rollers. Electric power will be used. Seventeen students, under A. C. Lawson, professor at the University of California, are at Grass Valley to study geology and practical mining.

Plumas County

The Los Angeles lessees of the Five Bears copper mine in the Genessee district expect to start work in a few days. The ore is to be concentrated, and the product shipped. At the Droege, 25 stamps are dropping, and 35 men are employed. The adit of the Leitrum mine, in the Bullfrog district, has to be driven 100 ft. more to cut the rich vein worked some time ago in the upper workings. C. L. Moseley and R. L. Stone, of San Francisco, have bonded the Glazier mine on North fork. The adit will have to be driven 200 ft. farther to cut the old channel. Seattle and Alaksa men own the Altona mine, and during last summer did 400 ft. of development work, with encouraging results. Now the snow is melting, work is to be resumed. Colorado people have acquired a property on the western branch of the old Jura river channel, and will thoroughly prospect it by test-pits and ground sluicing.

Shasta County

The aerial tram-line from the Reid mine, at Old Diggings, to the Southern Pacific siding is almost finished, at a cost of $20,000. There are 12 towers, and each of the two cables is 4400 ft. long, while the 30 skips of 600-lb. capacity can deliver 25 tons of ore per hour.

Tuolumne County

(Special Correspondence.)—The payment of $227,500 by the Black Oak Development Co. for the Black Oak mine was made on April 3 to the First National Bank of Sonora, where the deed to the property is in escrow, and simultaneously suit was brought in the Superior Court by the purchasing company against S. A. Knapp and others, to be adjudged owner of the property and for the deed of conveyance, which, it is alleged, Knapp refuses to deliver. The defendants in the action, excepting Knapp, have answered the complaint and admit that plaintiff has complied with the conditions contained in the agreement between the parties and is therefore entitled to the deed in escrow. A company whose purpose will be to develop and promote the sale of mining properties is being formed by J. W. McAllister, of Jamestown, and J. J. Beatty, of Nevada. It will be known as the Tuolumne County Exploration Co., and will have a capital stock of $25,000, divided into 100 shares of the par value of $250 each, all subscribed for. The Atlas Consolidated Mines Co., incorporated under the laws of West Virginia, has filed articles of incorporation in this county. The capital stock is $250,000, with 25,000 shares of the par value of $10 each. The incorporators are J. D. Hubbard, C. C. Concannon, Frederick Julian, Frank P. Pape, and Robert Oehmig, all of Chicago. The company is operating the Atlas mine, at Tuttletown, from which the first bar of gold was last week sent to the mint. An air-compressor capable of running 8 machine-drills has just been added to the equipment. John Witney is superintendent of the property. The company operating the Black Oak, near Soulshyville, will shortly begin active work on the Burns' mine, an adjoining claim. Considerable machinery will be installed, after which sinking will begin, and driving will commence as soon as sufficient depth is attained. Electric power will be used. A crew of men will shortly begin development work on the claim adjoining the Atlas, at Tuttletown, owned by John Richards.

Sonora, April 5.

COLORADO

Clear Creek County

(Special Correspondence.)—F. Nelson, manager for the Bard Creek M. Co., has gone to Tulsa, Oklahoma, where he will confer with a number of large stockholders regarding the construction of a 50-ton mill. The plant will be situated on Bard creek, and will be electrically driven, valuable water-powers being controlled. It is stated that the new mill will be completed within 90 days. H. B. Clifford, of New York, is here with a representative of Thomas A. Edison, and the two men have been making an examination of the Waldorf mines in East Argentine. It is stated that the present mill will be remodeled at once, and that the Edison machines for ore dressing will be installed. A. L. Stephens and associates, leasing on the fourth level of the Smuggler mine on Brown mountain, have been realizing $50 per foot net from extending the west drift. A 5-in. vein of 1100-oz. silver ore is being followed, and stoping will be started this week, when enlarged shipments will be made. The Mendota Mines Co., leasing above the Victoria level, on the Mendota mine, has doubled the force during the past week. Heavy shipments of smelting ore, and lead and zinc concentrate are being made. A. Robert, leasing on the Virginia City mine on Lincoln mountain, has started stoping on an 18-in. vein of solid ore that returns 79 oz. silver per ton. A large scheme of development has been started at the Ruler and Comet mines, situated on Griffith mountain, and operations

IDAHO SPRINGS, CLEAR CREEK COUNTY.

will be conducted through the Capital adit. C. H. Rowland, of Syracuse, New York, is manager. Shipments have been started from the East Griffith mine, of which F. A. Maxwell is manager.

Georgetown, March 31.

GILPIN COUNTY

Sinking of the East Notaway shaft has been stopped temporarily, and driving east and west on the 750-ft. level started in good ore. Twelve tons of ore sent to the Globe smelter returned 4.62 oz. gold and 7 oz. silver per ton. Nine men are working at the Troublesome mine and are keeping the Polar Star mill, at Black Hawk, working full time. Ore averages $45 per ton. The Gilpin-Eureka mill is working on ore from the mine. The Alps mine is producing fair ore for the lessees.

TELLER COUNTY (CRIPPLE CREEK)

According to local statistics, the March production of the district was as follows:

Plant.	Tonnage treated.	Average value.	Gross value.
Golden Cycle	32,000	$20.00	$ 640,000
Portland at Colorado City	10,000	21.00	210,000
Portland at Cripple Creek	15,700	3.26	51,182
Stratton's Independence	10,390	2.80	29,092
Ajax	4,500	2.80	12,600
Wild Horse	1,200	4.20	5,040
Kavanagh-Jo Dandy	1,800	2.15	3,870
Gaylord, Dante	1,500	3.00	4,500
Isabella	1,100	2.00	2,200
Smelters	3,750	65.00	253,750
Total	81,940		$1,162,234

The Acacia Gold Mining Co. has adopted the Isabella scale of royalties on lessees' ore. The El Paso company produced 145 cars of ore in March, and has paid a 2½c. dividend. Ore shipments from the Isabella ranged from $8 to $90 per ton, the latter value coming from the Kellum shaft. Another shipment of ore from the 1600-ft. level of the American Eagles mine has been made, the last averaging $115 per ton.

IDAHO

BOISE COUNTY

(Special Correspondence.)—The Pearl district at the present time is almost entirely a lessees' 'camp.' Those at the Whitman have taken out ore to the value of $9000, of which 52% was profit. This amount represents the actual gross value of the product shipped, which consisted of 158 tons of concentrate and 34 tons of crude ore, there being 386 tons mined. The ore contains gold and silver. No amalgamation was attempted, as the Whitman mill is equipped with rolls, jigs, and tables. Lessees working on the Checkmate property are driving on a vein south of the Checkmate vein. This property has been idle for several years. It is opened to a depth of 500 ft. and has produced $500,000. The Checkmate lessees built a three-stamp mill and are milling ore from other claims in the district in addition to handling their own output. No figures are available as to the amount of bullion produced. The Dewey property has been operated under lease for more than three years. At the present time the lessees have a considerable tonnage of mill ore on the dump, and expect to use the Black Pearl mill in treating it. Placer property on the Payette side of the ridge are also being worked by lessees. Four men are working the Church ground. They are working a 10-ft. bank that gives good prospects from top to bottom. This ground has not been prospected by drilling or sinking. The auriferous gravel covers a considerable area, and in places is known to be more than 30 ft. deep. There is water enough to keep one 2-in. machine running 16 hours.

Pearl, April 4.

CLEARWATER COUNTY

The Sprague Gold Placer Mining & Dredging Co., with a capital of $25,000, is working 180 acres of ground at Pierce, and during the past 14 months has made a net profit of $70,000. The coming season is expected to be a good one, as there is plenty of water available.

IDAHO COUNTY

(Special Correspondence.)—Hydraulic stripping to make lode-mining possible is the unusual treatment to which the Iron Crown mine, in the Newsome district, will be subjected by W. V. Garrett, and associates, of Spokane. The stripping of the property is not to be without its profit, a liberal panning of the surface in earlier years having disclosed the presence of much gravel that attracts the placer miner. It will be handled in the usual way, and operations are to begin as soon as the snow leaves. The property is equipped with a mill and other plant.

Newsome, March 28.

SHOSHONE COUNTY

(Special Correspondence.)—Elimination of overhead trolley systems will result in the Coeur d'Alene if experiments with storage-battery motors, being conducted in the Bunker Hill, prove practicable in the movement of large tonnages. A number of mine accidents are attributed to low-hung trolley wires. Electricians and master machanics in the Coeur d'Alene region are watching the experiments with interest, and should they prove successful, other companies using electric power will adopt the new system.

Wallace, March 28.

The overlapping of claims covering three acres is the cause of another lawsuit between the Stewart Mining Co., controlled by F. A. Heinze, and the Bunker Hill & Sullivan M. & C. Co. The Tuscumbia property, in the Sunset district, has been bonded to New York people. It is said that 4 ft. of ore assaying 7% copper has been cut in the Black Traveler, about five miles from Saltese. The Blue Bell adit, at Big creek, is in 2200 ft., and about 50 ft. more driving should cut the vein outcropping at the surface. The Yankee Boy, nearby, is worked by lessees, who employ 25 men, and are mining rich ore. The Stewart mine is employing 250 men, and produces 500 tons of ore for the mill daily, and 120 tons of ore per week for the smelter at Tooele, Utah, and makes a net profit of about $55,000 per month. The court has decided that the Stewart company must pay $10,000 to the widow of L. Chiara, who was killed on an ore-train employed by the company. Another case, involving $15,000 damages, is being defended against D. Barter.

According to Sidney Norman, who is representing the Federal Mining & Smelting Co. in its fight against the American Smelting & Refining Co., recent investments in new mines and their development will total about $1,000,000. The company's president, H. Day, draws $15,000 per year and $350 monthly expenses, while the chairman of directors, F. H. Brownell, draws $12,000 and expenses.

MONTANA

SILVERBOW COUNTY

The output of the various producing companies for March of the Butte mines is reported as follows:

	Ore, tons.	Copper, lb. per ton.	Total lb.
Boston & Montana group	98,800	65	6,422,000
Anaconda group	130,000	61	7,930,000
Butte & Boston	11,110	62	688,200
Washoe	6,900	61	420,900
Parrot	2,800	60	168,000
Trenton	11,220	61	684,420
North Butte	28,320	68	1,925,760
Butte Coalition	32,600	70	2,282,000
East Butte	10,620	110	1,168,200
Tuolumne	6,000	120	720,000
Original	9,110	60	546,600
Alex Scott	6,700	110	737,000
Davis-Daly	1,700	110	187,000
Total	355,870		23,880,080

NEVADA

CHURCHILL COUNTY

Shortage of water interfered with operations at the Nevada Hills property in February, and only 1527 tons of

ore was treated, yielding $20,744. Costs were $21,577, and the total loss was $1153. Mill recovery was 20.6% by concentration and 66.3% by cyanidation, and costs were: mining, $7.85 per ton; milling, $3.79; marketing, 61c.; taxes, and general expenses, $1.70 per ton.

ELKO COUNTY

(Special Correspondence.)—The most important deal in the history of the camp of Jarbidge was consummated this week, when J. A. Jess, representing the Potter Palmer estate, of Chicago, purchased control of the stock of the Buster Consolidated Gold Mining Co. The plans of the new owners are not fully matured, but it is definitely decided that a large mill, in which to treat the Buster ores, will be erected. The Buster is one of the best developed of the Jarbidge mines, and though it has no high-grade ore, such as was recently uncovered on the Flaxies, a big tonnage of free-milling ore averaging between $15 and $30 per ton, with occasional lenses that will yield about $100 per ton, is reported. This is not the first investment of the Palmer estate in Jarbidge, as it owns the Alpha mine, which it purchased for $50,000 cash some weeks ago.

Jarbidge, April 5.

ESMERALDA COUNTY

The preliminary estimate of March production of the Goldfield Consolidated is 30,100 tons of ore yielding $650,000, at a cost of $185,000, leaving a profit of $465,000.

STOREY COUNTY

The Truckee River General Electric Co. has served a notice upon the United Comstock Pumping Association, stating that if the sum of $15,000 is not paid by May 1, power will be cut off from the mines. The feeling in Virginia City is that this action is unreasonable, as the Comstock mines helped to finance the power scheme and have been an important source of income to the power company.

NEW MEXICO

EDDY COUNTY

(Special Correspondence.)—The Dayton Oil Co. (a Doheny subsidiary) is now operating its standard rig on the Cass-Hammond lease, making approximately 100 ft. per day. R. T. Coovert is in charge, coming here from the Bakersfield field. This is the first company to begin deep operations here. The Pecos Valley Oil & Gas Co. is working with standard rig (rotary) on the Martin lease, expecting to go to the deep pool. This company owns the Brown well, which is pumping from 35 to 75 bbl. per day, the oil selling at the well at $1.25 per barrel, and is in good demand. It is a good fuel oil, of gravity 30. The same company is developing the Everest well, having packed off the water flow. No information is given out, but it is expected this well will come in a better producer than the Brown. William M. Belt has perfected arrangements to pack off the water and bring in a good pumper at his well. This well, with a flow of 600 gal. of water per minute, is producing 2 bbl. per day of a high-grade lubricating oil, selling at the well for 5c. per gallon. The Noah Oil & Gas Co. has ordered its standard rig from Tulsa, Oklahoma, and will begin drilling on a school section near the Belt well, as soon as equipment can be placed.

Artesia, March 29.

GRANT COUNTY

The March production of Chino was 4,587,509 lb. of copper, making a total of 11,658,065 lb. for the first quarter of 1913.

OREGON

JACKSON COUNTY

The Sterling Gold Quartz M. & M. Co. will hold an adjourned stockholders' meeting April 13 to consider financing of the company. At the regular meeting in March it was resolved to ask the stockholders to submit to a voluntary assessment to raise funds for patenting the ground and working the property.

UTAH

BEAVER COUNTY

The Newton mining district, which extends along the range from North to Indian creek, is attracting attention. Electric power is to be used at the Sheep Rock property, and transmission poles are being erected. An electric hoist and drills will be installed. The 5-stamp mill, with plates and tables, is treating 12 tons of $20 to $40 ore per day. J. Robinson is in charge. The Beaver Butte, about a mile distant, is being prospected. The Oak Leaf shaft is to be sunk from 150 to 250-ft. depth. Other properties will be opened in a short time.

SALT LAKE COUNTY

A preliminary statement covering operations of the Utah Consolidated Co. for 1912 shows that the main shaft is down to No. 12 level, and development at that depth has only recently begun, while considerable diamond-drill work is under way. While the grade of the copper ore has continued to decline with depth, it is intended to sink another 100 ft. The lead ore opened occurs in more or less irregular deposits, but it is of good grade, and present shipments total 200 tons per day. The mine produced more lead than copper in 1912, this being partly due to the strike and subsequent period. The year's output was 6,506,814 lb. copper, 8,734,398 lb. lead, 230,004 oz. silver, and 14,042 oz. of gold, net earnings being $603,923.

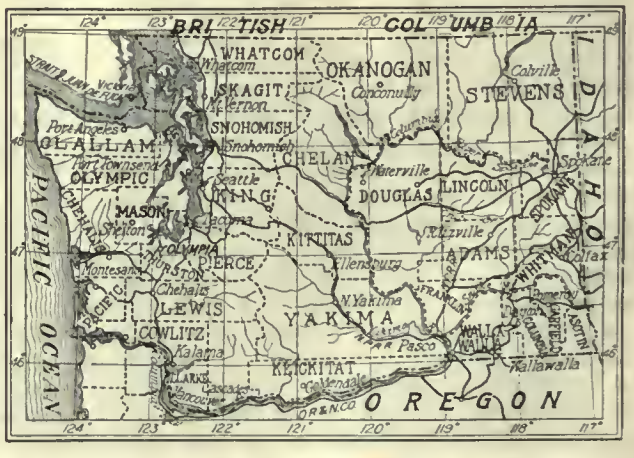
The annual report of the United States Smelting, Refining & Mining Co. states that the Bingham mines produced 57,106 tons of lead and 186,165 tons of copper ores, production being affected by the strike, while the Centennial-Eureka mine yielded 117,950 tons. The smelter at Midvale, Utah, and custom and Mexican ores, produced a total of 21,152,620 lb. copper, 56,385,769 lb. lead, 12,059,829 oz. silver, and 140,183 oz. of gold. The year's profit was $4,232,965, and $2,589,882 was paid in dividends.

The February copper production of the Utah Copper Co. was 7,819,900 lb., against 7,560,521 lb. in January and 8,612,729 lb. in February of 1912.

WASHINGTON

STEVENS COUNTY

The Hecla Copper-Silver Mining & Milling Co. has been organized with a capital of $1,000,000, to develop six claims south of the United Copper and near the Blue Star, 3½ miles northeast of Chewelah. Four veins have been discovered, the main one being from 6 to 14 ft. wide, and



MAP OF WASHINGTON.

trenches and shallow shafts sample 5.4% copper, $1 in gold, and $1.80 per ton in silver. An adit will be driven on the vein. There is plenty of water and timber, and a good millsite available.

Electric power will be delivered to the Chewelah district during the coming season.

CANADA

BRITISH COLUMBIA

During the past 10 days of March the Granby smelter at Grand Forks treated 35,005 tons of ore, and produced 717,000 lb. of copper, making a total of 308,077 tons of ore, and 5,588,245 lb. of copper for the first quarter of the current year.

ONTARIO

(Special Correspondence.)—According to W. C. Crowther, of New York, who has spent about six months in the Porcupine district, a vein of pitchblende has been discovered near the shore of Lake Mechemanda, and by analysis shows a greater percentage of radium and allied metals than the Austrian and Cornish mines, which produce practically all the present supply.

Ottawa, April 1.

A new vein has been cut on the 600-ft. level of the Pearl Lake mine, at Porcupine, assaying $17 per ton in gold, and is the third vein opened on this level. No. 3 level of the McIntyre has cut two veins which had been opened on the upper levels. A diamond-drill is at work at the Dome mine. Experiments with concentrating and cyaniding are being tried at the McEnaney mill.

The annual meeting of the Hollinger Gold Mines, Ltd., was held in Montreal last week. Ore reserves are estimated as 644,540 tons, worth $11,271,400, and development covered 5201 ft. Ore is assured to a depth of 300 ft., and there are 34 veins upon which no work other than sampling outcrops has been done. Ore from the mine and dumps totaled 45,195 tons, yielding $933,681, of which net profit was $600,664. Dividends absorbed $270,000, and $351,802 was carried forward. Costs in February were $5.97 per ton. The strike cost the company $100,000.

JAPAN

The Echigo oilfields are developing rapidly. Introduction of California rotary drills by the Nippon Oil Co. has resulted in successful completion of a number of good wells. At present there are in the field about 500 wells, most of which are small and shallow. The newer wells yield 50 to 500 bbl. per day of 42° to 43° oil. This commands a high price locally, and the industry is flourishing. Within the last year, a new oilfield has been brought in on the northwestern coast of Hondo. The oil is of low grade, but suitable for use as fuel. The full importance of the field has not yet been determined.

MEXICO

During February, development in the mines of Esperanza, Ltd., at El Oro, covered 906 ft., and drifts on the San Carlos vein advanced 235 ft., the average width being 5 ft., assaying 1.75 oz. gold per ton, while the raises advanced 160 ft., showing 5 ft. of 2.25 oz. ore. The mill worked 26 days, crushing 4522 tons of ore and treating 10,065 tons of tailing, while 273 tons of concentrate was shipped to the smelter. The total yield was $96,640. Total expenses were $72,412, and profit $24,228.

AUSTRALIA

WESTERN AUSTRALIA

(Special Correspondence.)—The Hainault mine and mill is shut down pending amalgamation with the South Kalgurli, when in all probability the ore will be treated in the latter's dry-crushing and roasting plant. The various labor unions decided by a large majority to settle their differences with the Chamber of Mines by arbitration. The new university is still being organized. The Victorious mine, of the Associated Northern company, at Ora Banda, is attracting a lot of attention. In January the Huntington mill plant treated 9600 tons of ore, yielding $60,000. Mining costs were $1, milling $1.10, general expenses 19c., development 45c., and the profit was $34,000. Salt water used in the mill gave trouble with the filter-cloths, but this was overcome by adding make-up water at the circulating-solution tank, instead of just prior to filtering. Great hopes are built on the volatilization process at the Gwalia Consolidated, described in this journal of March 29. The complex ore from the Transvaal mine, Southern Cross, is being experimented on at Broken Hill. This ore contains arsenical pyrite and graphite, and about $14 per ton in gold. It is stated that the Murex process at the Whim Creek copper mine is a failure, and the recently appointed metallurgist returned to Kalgoorlie. The Queen of the Hills mill should soon be in operation.

Kalgoorlie, February 15.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

T. J. GRIER is in San Francisco.

W. M. BREWER is back in Victoria.

C. S. HALEY has gone to Siskiyou county.

S. H. BALL was in San Francisco this week.

DESAIX B. MYERS has gone to Calaveras county.

RALPH ARNOLD has gone to Venezuela again.

L. S. AUSTIN is at Georgetown, British Guiana.

FRANCIS P. BAAY left London for Melbourne, April 4.

CARR B. NEAL has returned to New York from Arizona.

E. NORRIS HOBART is now engineer at the Tiro General.

JOHN MOCINE is general manager for the Goldfield merger.

P. H. ARGALL has been elected Mayor of Victor, Colorado.

SIDNEY NORMAN has returned to New York from Spokane.

LIONEL HILL has gone to London from British Columbia.

EMILE HUGUENIN has returned to San Francisco from Venezuela.

J. D. HUBBARD has been looking at placer properties in Butte county.

R. A. JOHNSTON, of the Canadian Geological Survey, is visiting California.

C. H. MUNRO, who has been in Peru, was expected in New York this week.

L. H. METZOAR is underground superintendent for the Goldfield Consolidated.

J. J. COLLINS has gone to Northern Nigeria for the Naraguta Extended, Limited.

F. A. BRISTOL died at Banning, California, March 28, after a year of failing health.

G. F. BECKER has been nominated for president of the Geological Society of America.

LOUIS A. WRIGHT married Miss ELLA WARD BIRDSALL at Newburgh, New York, April 2.

V. C. BARNELT will leave New York for a month's vacation in England the first of May.

A. J. CHAPPLE has been appointed metallurgist to the Mt. Boppy Gold Mining Co., New South Wales.

A. C. LAWSON has been at Nevada City with a party of advanced students from the University of California.

JOHN I. KANE has been transferred from the Tiro General at Charcas to the general staff of the A. S. & R. Co. at Mexico City.

H. KENYON BURCH, chief engineer for the Inspiration Con., is making a tour of the southwest and will spend a few days in Los Angeles before returning to Miami.

E. J. DUNN, formerly director of the Geological Survey of Victoria, has been appointed consulting geologist to the Clunes Goldfields, Ltd., an English company operating in Victoria.

JOHN G. KIRCHEN is president, and ALBERT BURCH and FRED SIEBERT vice-presidents, of the Nevada Mine Owners Association. W. B. ALEXANDER is secretary and will devote his whole time to the work.

S. H. BROCKUNIER, superintendent for the Pennsylvania G. M. Co., Westville, California, who has been seriously ill with pneumonia for several months, is now convalescent at his home in Nevada City.

N. H. LAWRIE, W. C. FELLOWS, T. S. MANN, J. F. REDDY, and C. T. PRALL have been appointed by the Governor of Oregon on the board of managers of the newly created State Bureau of Geology and Mines.

JAMES HEBARD, of the Central mine, Broken Hill, has been appointed president of the Australasian Institute of Mining Engineers, which body will hold its annual meeting at Broken Hill commencing May 26.

S. F. SHAW is back at Charcas and work has been resumed, though with a reduced force. Mr. Shaw and his British and American associates have received the thanks of the State Department at Washington for taking a locomotive and cars and rescuing 15 people penned in a church at Charcas by rebels, and protected by a priest.

Market Reports

LOCAL METAL PRICES

San Francisco, April 10.

Antimony	12—12¾c	Quicksilver (flask)	41
Electrolytic Copper	15¾—16c	Tin	52—53¼c
Pig Lead	4.60—5.55c	Spelter	8—8¼c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES

(By wire from New York.)

NEW YORK, April 10.—The copper market has been active this week with large buying here and in Europe. Prices have accordingly been firm. Lead still remains unchanged. Spelter is under pressure on account of producers forcing metal on the market and prices have been weak. Average daily prices for the past week in cents per pound, based on wholesale transactions, standard brands, are given below.

Date.	Silver, per oz.	Electrolytic Copper.	Lead.	Spelter. St. Louis
April 3	58⅜	15 10	4.30	5.65
" 4	58	15.12	4.30	5.63
" 5	58¼	15.15	4.30	5.60

Copper Producers' Association Report

The Copper Producers' Association statement, April 8, shows a decreased surplus. The details are as follows:

	Pounds.
Stock of marketable copper of all kinds on hand at all points in the United States, March 1, 1913	122,302,198
Production of marketable copper in the United States from all domestic and foreign sources during March	136,251,849
Deliveries for consumption, March	76,585,471
Deliveries for export, March	77,699,306
Stock of marketable copper of all kinds on hand and at all points in the U. S., April 1	104,269,270

Recent changes in surplus have been as follows, in pounds:

	Increase.	Decrease.
March 1912	.....	572,431
April	2,927,829	.....
May	.....	15,450,386

Afloat as advised—	
From Chile to Europe	2,775
From Australia	4,500
Total visible supply	43,639

Company Reports

MYSORE GOLD MINING COMPANY, LTD.

The results of this great concern, which has produced $58,700,000 and paid over $33,500,000 in dividends, during the year 1912 may be summarized as follows:

Ore reserves, tons	1,337,990
Ore treated, tons	299,660
Tailing treated, tons	247,340
Slime treated, tons	7,476
Gold produced, 232,738 oz., worth	$4,339,200
Mining and treatment costs	1,396,000
Profit	2,467,000
Dividends paid	1,830,200
Capital expenditure and depreciation	364,000
Reserve fund total	600,000
Carried forward	180,300

MT. BISCHOFF TIN MINING COMPANY

This company's property is situated at Waratah, and smelting works at Launceston, and is the leading tin producer in Australia. The capital of the company is 12,000 shares, with a total of $142,000, and dividends to date total $10,944,000. Ore is mined principally by open-cut, hydro-electric power is available, and the smelter treats custom ore. Results for the last half of 1912 were as follows:

Ore reserves, tons	3,000,000
Ore treated, tons	117,328
Tin concentrate produced, tons	600
Smelter work:	
Concentrate smelted, tons	2,065
Metallic tin produced, tons	1,448
Analysis of tin, per cent	99.88
Profit for half-year	$205,000
Dividends paid	190,000
Assets	275,000
Liabilities	14,000
Working costs:	
Mining, per ton	$0.66
Aerial ropeway, per ton	0.04
Milling and concentrating, per ton	0.28
Prospecting and development, per ton	0.06
Electric power, per ton	0.01
Surveys, assays, water system, per ton	0.03
Administration, per ton	0.04
Total	$1.12

McKINLEY-DARRAGH-SAVAGE MINES OF COBALT, LTD.

During 1912 mining operations in the McKinley section covered 5336 ft. On the 150-ft. level, No. 2 Swamp vein yielded the highest grade of ore ever mined by the company, but most of it has been stoped out. An extension of the vein is being stoped on the 200-ft. level. The Lake, No. 6, and No. 20, on the 150, 110, and 150-ft. levels, respectively, produced rich ore. Small branches of the Blind vein were developed on the 200 and 250-ft. levels. No. 3 Swamp and No. 14 veins have added considerably to the existing reserves. The Princess vein, situated in the southwestern part of the property, does not appear likely to produce much ore. Ore mined totaled 52,040 tons, and rock 14,292 tons, while 52,482 tons was milled. Reserves are estimated as 100,400 tons, containing 4,133,500 oz. of silver. Development to date has covered 25,402 feet.

In the Savage section, No. 2 vein has been opened on the 245-ft. level, proving short lenses of ore, although above this level is a considerable tonnage. An extension of No. 4 vein on the 140-ft. level yielded some high-grade ore. No. 14 vein is small, but carries rich ore, while No. 12 is also small, carrying fair silica content on the 190-ft. level. A large amount of development work is under way. The aerial tramway connecting the Savage with the McKinley mill of 10 stamps was completed, and 20 stamps and one tube-mill are being added to deal with the Savage ore, when the Savage sorting plant will be shut down. The mine produced 17,990 tons of ore and 14,804 tons of rock, and 17,888 tons of ore was milled. Reserves are estimated as 52,400 tons, containing 1,235,000 oz. of silver. Development to date has covered 9375 ft. The year's results from the whole property may be tabulated as follows:

Ore treated, tons	70,370
Silver produced, ounces	2,717,383
Production to date, ounces	10,770,176
Net profit	$1,141,753
Dividends paid	674,307
Current assets, including cash, ore at smelters, supplies	947,238
Current liabilities, including dividend paid January 1, 1913	482,521
Surplus	422,326

NORTH STAR MINES COMPANY

This well known property is situated at Grass Valley, Nevada county, California, and mining operations are being conducted at a depth of 5300 ft. on the incline. The past year's tonnage of ore was derived from stopes above the 3000, 3400, 3700, and 4000-ft. levels, and development covered 4601 ft., the 5000 and 5300-ft. levels opening a considerable body of fair-grade ore. Generally speaking, the mine is in its usual condition, and at the present scale of operations will last for several years. Prospecting work covered 2088 ft. in the Cincinnati property, but with little encouragement, so work was stopped in August, after an expenditure of $91,355 since 1910, the mine only yielding 650 tons of ore worth $3653. The company advanced $2000, making $74,500, to the Middle Yuba Hydro-Electric Power Co., which is now practically self-supporting. The Champion mines at Nevada City are held under option, and during 1912 development covered 8500 ft. The Ural and Meinfield veins were opened on the 1000 and 2400, and 1600-ft. levels, respectively. The prospective value of the property is sufficient to justify its acquisition, and it will be bought before July 1913. In 1911 and 1912 a total of $369,334 was spent on the Champion, in development and on account of purchase price. The 20-stamp mill was repaired and ran on a test of ore from the 1800 and 1600-ft. levels, the average value being $8.80 per ton. A cyanide plant is being erected at the mill. The results of the past year's work may be summarized as follows:

Ore treated from North Star mine, tons	101,181
Total production	$1,038,372
Average per ton	10.26
Production from Cincinnati and Champion mines	34,002
Ore production from North Star properties since 1884, tons	1,035,194
Total value	$14,045,092
Operating expenses in 1912 at North Star mine	558,892
Expenditure on other properties	262,078
Dividends paid	300,000
Dividends paid to date	3,786,989
Cash and investment account	907,305

CALUMET & ARIZONA MINING COMPANY

The annual report of this company states that development work covered 25,787 ft., including 441 ft. of diamond-drilling. In the Irish Mag section of the mine, cross-cuts driven on the 850 and 950-ft. levels to the oxidized ore-body found last year opened no ore. Cross-cuts driven on the 950 and 1050-ft. levels in the east corner of the claim disclosed considerable oxidized ore. A small shoot of sulphide ore was opened east of the shaft, on the 1250-ft. level. In the Oliver section, north of the shaft, work was abandoned on the 950-ft. level. Low-grade oxidized ore was mined between the 950 and 1050-ft. levels of the Senator claim, while other work on the 1150, 1250, and 1450-ft. levels proved no extension. Considerable sulphide ore was opened on the 1250 and 1350-ft. levels, near the west end of the Senator. Work on the Buckeye claim was not profitable, excepting good extensions of sulphide ore on the 1350 and 1450-ft. levels. During July 1912 the Courtland mines

were reopened, and 785 ft. of development was done, while shipments of ore have averaged 600 tons per week. Reserves in these claims amount to 23,000 tons of 5% copper ore. The future is doubtful. In the Ajo district, Pima county, Arizona, considerable work was done on a number of the New Cornelia Copper Co.'s claims. Two fractional claims were purchased, and options taken on 19 others. The carbonate ores will require special treatment, which is now being investigated. An option was taken on the Daggs-Newman group in the Pioneer district, Pinal county, also on 26 other claims. An adit will be driven 600 ft., and a shaft sunk 600 ft., before any results are expected.

Regarding surface equipment, there was no change at the old smelter. Good progress was made with the new plant, which should be ready for operation in August 1913. The report gives a fairly complete description of this smelter, which will include a sampling mill and crushing plant, bedding system for ores, roasting, blast-furnace, reverberatory, and converter plants, chimney and flue connections, and power-plant improvements. The year's results were as follows:

Ore mined, tons	179,788
Ore smelted, tons	159,513
Fluxing ore smelted, tons	17,054
Copper content of ore, per cent.	5.07
Copper recovered, per cent.	4.60
Copper content of fluxing ore, per cent.	1.23
Copper recovered, pounds	16,490,229
Silver yield, ounces	233,092
Gold yield, ounces	9,066
Value of production	$2,897,024
Expenses of production	1,734,926
Profit	1,190,376
*Income from other sources	1,742,342
Dividends paid	2,542,781
Cash, supplies, ore, and bullion, value	1,215,660

*Interest in Superior & Pittsburg Copper Company.

BROKEN HILL SOUTH SILVER MINING CO., N. L.

The report of this company for the half-year ended December 31, 1912, may be tabulated as follows:

Men employed: surface, 362; underground, 804; total	1,166
Development of mine, including diamond-drilling, feet	5,182
Filling delivered to stopes, cubic yards	58,571
Ore reserves, tons	3,250,000
Ore mined, tons	178,547
Average metal contents:	
Lead, per cent.	13.7
Zinc, per cent.	13.8
Silver, ounces	6.4
Ore treated, tons	180,080
Concentrate produced, tons	27,238
Metal contents:	
Lead, tons	18,755
Zinc, tons	1,695
Silver, ounces	617,679
Zincy tailing produced, tons.	128,446
Zinc content, per cent.	15.8
Old tailing sold to Zinc Corporation and Amalgamated Zinc companies' flotation plants, tons.	182,833
Zinc content, per cent.	.17
Products on hand, tailing, and slime, tons.	1,368,670
Costs per ton:	
Mining and filling stopes	$3.20
Development	0.56
Concentrating	0.86
Total	$4.62
Water consumption, gallons	33,019,000
Value of mine production.	$1,560,000
Value of tailing sold.	370,000
Total costs	830,000
Dividends	820,000

During the year, No. 1, 4, and 5 shafts were sunk to 1164, 1137, and 378 ft., respectively. The 725, 970, and 1070-ft. levels contributed 89% of the ore mined. Development on the 1170-ft. level covered 359 ft., making 489 ft. from No. 2 shaft. At 285 ft. south of the shaft ore was cut and driven on for 85 ft., assaying 11.7% lead, 8.6% zinc, and 3.3 oz. silver, followed by 40 ft. of 7.8% lead, 7.5% zinc, and 2.7 oz. silver ore, then 79 ft. of ore assaying 14.6% lead, 12.6% zinc, and 3.6 oz. silver, the present face being in similar ore. Metal recoveries were: from concentrating, 76% lead, 6.8% zinc, and 53.8% silver; and from zincy tailing, 15.7% lead, 82.2% zinc, and 34.9% silver; making a total of 88.7% lead, 89% zinc, and 88.7% silver. The report is accompanied by interesting surface and underground plans.

PHELPS, DODGE & COMPANY

The authorized capital stock of this important company is $50,000,000, of which $45,000,000 has been issued, and it controls operations of the Copper Queen Consolidated Mining Co., Moctezuma Copper Co., Detroit Copper Mining Company of Arizona, Burro Mountain Copper Co., the Stag Cañon Fuel Co., and the Phelps-Dodge Mercantile Co. The company also has large interests in the Old Dominion Co., Old Dominion Copper Mining & Smelting Co., United Globe Mines, Commercial Mining Co., and the El Paso & Southwestern railroad. As well as marketing the products of its own mines, the company acts as a selling agency for various other concerns.

The report of the president, James Douglas, for the year ended December 31, 1912, states that the term was one of normal operation. The total copper production from the various mines under direct control was 139,759,515 lb., which realized an average price of 15.51c. per pound, net cash in New York. Of the total quantity delivered, the domestic sales were 98,267,037 lb., and foreign sales 94,030,337 lb., of which 52,537,859 lb. was the product of other mines sold on commission. Four dividends of 2½% each, an extra one of 2%, and another of 3%, in all 15%, were paid during 1912, amounting to $6,750,000.

The general manager, Walter Douglas, stated that owing to the high price of copper during the last nine months of the year, the mines and plants were operated to full capacity. The costs per ton of ore and per pound of copper were higher in the Arizona porperties, by reason of higher wages and taxes. Ore mined from the various properties totaled 1,893,244 tons, of which 1,098,528 tons was concentrated and 794,716 tons smelted. The total amount of copper-bearing material smelted was 1,051,315 tons. In addition to this, there was produced 11,626 tons of lead ore from the Copper Queen, yielding 30,434 lb. copper, 2,953,685 lb. of lead, 326,962 oz. of silver, and 3889 oz. of gold. Of the total products smelted, 97,574 tons was purchased. Production was as follows:

	Copper, lb.	Silver, oz.	Gold, oz.
From companies' ores	140,628,798	1,104,510	16,002
From custom ores	8,050,091	584,642	11,685
Total output	148,678,889	1,689,152	27,687

The Stag Cañon Fuel Co. mined 1,383,562 tons of coal, of which 646,061 tons was consumed in the manufacture of 319,222 tons of coke.

The tonnage extracted from the Copper Queen mines was the greatest in their history, and, in view of this great tonnage, it was considered advisable to increase development work in order to maintain the ore reserves, so no less than 78,000 ft. of exploration was done. Three large mining properties were purchased by the Detroit company. Development in the West Yankie country continues to expose ore at a greater depth than was expected. Political disturbances in Mexico interfered with operations of the Moctezuma mine, the Nacozari railroad having to suspend service for 30 days. Development at the mine was satisfactory. On No. 5 level of the Burro Mountain mine, considerable low-grade ore has been opened. In August the Chemung Copper Co.'s property was purchased. Total gross sales of the mercantile company reached $6,321,411, on which a net profit of 9.21% was made. The balance-sheet of Phelps, Dodge & Co. shows cash and bills receivable, $6,133,550, and accounts payable, $5,257,683, and a surplus

of $6,163,561. Dividends received from subsidiary companies were $10,005,458, and other earnings were $406,077, while dividends paid amounted to $6,750,000, the balance being made up of expenses and taxes, $126,349, transferred to reserve against stock owned, $1,500,000, and to surplus account, $2,035,185.

Copper Queen Consolidated Mining Company

The report of Gerald Sherman, superintendent of the Copper Queen, states that mine development covered 78,135 ft., and great credit is due to A. Notman and the geological department of the company for efficient work. The amount of timber used in mining is being reduced by better methods, and top-slicing is being introduced. There are 8.3 miles of main haulage track, operated by electricity, in the mine, and the average number of miles trammed by electric locomotives was 2452 per car, against 626 by mules, and 210 by hand. The Sacramento was used as the main hoisting shaft, and a new man-hoist is being installed there. Slag shipments to Douglas totaled 64,480 tons.

The general manager, S. W. French, reported that shipments to Douglas were 669,399 tons of ore, and 75,179 tons of precipitate, slag, and lessees' ore; to El Paso, 11,626 tons of lessees' and company ore; and to Globe, 30,164 tons of sulphide ore; a total of 786,368 tons. The yield was 88,280,908 lb. of copper; 2,953,685 lb. of lead; 18,023 oz. of gold; and 1,027,130 oz. of silver. The reduction works treated 962,914 tons of Copper Queen, Moctezuma, and custom ores, yielding 123,876,100 lb. copper, 27,687 oz. gold, and 1,689,152 oz. silver. The stocks of ores and metal contents on hand at January 1, 1913, were: 100,716 tons of ore, 11,999,650 lb. copper, 232,211 oz. silver, and 3875 oz. gold.

The Hospital Department had an income of $90,054 from employees' fees, and other cases, and the expenditure was $81,102. The staff of physicians and surgeons numbers 10, with Dr. F. E. Shine as chief surgeon. The Employees' Benefit Association had an income of $71,708, and the expenditure was $48,864. Wages were increased during the year.

F. Rutherford, superintendent of the smelting department, states that the entire plant dealt with 1,151,949 tons of charge, of which 884,814 tons was smelting ore, 73,720 tons of silicious ore for the converters, and 193,415 tons of 'secondaries.' The blast-furnaces treated 1,095,861 tons of charge, and used 139,955 tons of coke, equal to 12.78% per ton of charge. The ash in the coke accounted for 45,765 tons of slag. Flue dust recovered was 64,662 tons, or 5.9% of the total charge. The cupola furnace produced 180,522 tons of matte, giving a matte-fall of 20.97%. The reverberatory plant was only operated since June, and treated 56,086 tons, producing 15,163 tons of matte, or 29.84%. Since April, the acid process of converting was gradually changed to the basic process, and now the Great Falls type is working satisfactorily. The converter plant treated 195,685 tons of matte, with 6.16 stands operating per day, producing 62,458 tons of bullion, or 27.77 tons per stand per day. The average for the large and small converters was 44.9 and 23.2 tons per day, respectively. During the year 6970 samples were made from 352,547 tons of ore, and 86,389 determinations were made in the laboratory. The reverberatories used 53,164 bbl. and the boiler plant 119,831 bbl. of California oil. The cost of power was $55.12, that used by the smelter being $58.92, and from the turbo-generator $38.26 per horse-power. Net earnings of the Copper Queen in 1912 were $6,977,378, and $5,707,351 was paid in dividends.

Detroit Copper Mining Company of Arizona

The general manager of this company, A. T. Thomson, reported that the mines at Morenci yielded 519,632 tons of ore, producing 24,802,789 lb. of bullion. The increase in wages added 10c. per ton to the cost of mining, and the reduction of working hours from 8 to 7½ per shift cut the quantity mined from 3.95 to 3.68 tons per man. By better mining methods the consumption of timber has been decreased. The mill produced 70,438 tons of 16.69% copper concentrate, from 501,928 tons of 3.08% copper ore, extraction being 77.06%. The number of men employed was 1414.

The report of M. H. McLean, mine superintendent, shows that 10 classes of ores were mined for the concentrator and smelting plant, totaling 519,632 tons. A fire in the Yankie mine caused a reduction in output of that property. Reserves on No. 6 and 7 levels are 194,939 tons of 2.36% ore. Ellis W. Honeyman, smelter superintendent, reported that 160,649 tons of charge was smelted, using 18,450 tons of coke, and the metallurgical saving was 93.86%. The Detroit company's net earnings were $1,406,170, and dividends paid were $1,464,610.

Moctezuma Copper Company

In the general manager's report by J. S. Williams, Jr., it is stated that development and mining at the mines at Nacozari, Sonora, covered 31,431 ft. On the 800-ft. level of the Guadalupe an orebody of large size was developed, and contains high-grade ore. On the 800, 900, and 1000-ft. levels from the Martinez shaft, fair ore has been opened. The total ore opened during 1912 was 460,000 tons, and broken ore in reserve is 331,518 tons. The Geological Department proved of great benefit. The concentrator treated 596,000 tons of ore assaying 3.49% copper, and produced 131,062 tons of concentrate worth 13.37% copper, the saving being 85.95%. Milling practice was without change, but new classifiers, vanner feed distributors, and Deister tables will be installed. Net earnings of the Moctezuma company were $2,735,061, and dividends amounted to $2,118,569.

AMERICAN SMELTING & REFINING COMPANY

The business of this company during the year ended December 31, 1912, was satisfactory in all departments. Political disturbances in Mexico interfered with traffic between the mines and smelters in that country, but through various economies effected, and higher prices for the smelter products, the gross profit was $1,647,374 greater than the previous year. The sum of $367,823 was appropriated from the year's earnings, and partly distributed among the company's employees, the balance being added to the pension fund, which is now $500,000. In spite of many unusual charges, and increased amounts written off from the book value of investment securities, depreciation, and amortization of property, the net income is $508,173 greater than for 1911. Regular quarterly dividends were paid on the preferred and common stocks, and the surplus, after these payments, was increased by $3,059,676. There was spent during the year the sum of $2,447,300 on repairs and replacements at the plants; also $3,113,338 at refining and smelting plants and mining properties. Further heavy expenditure will be made during 1913. The total book value of all securities now owned is $1,010,538. The pension fund of $500,000 is to be devoted to caring for all men employees over 65 years of age, and women over 60 years, who have been continuously employed by the company for 20 years. No pension will exceed $200, nor be less than $20 per month, subject to exceptions recommended by the Pension Board.

A summary of the consolidated income of the American Smelting & Refining Co., and the American Smelters Securities Co., is as follows, fractions being omitted:

	Year ended Dec. 31, 1911	Year ended Dec. 31, 1912
Net earnings of smelting and refining plants, etc.:		
Amounts before deducting repairs and replacements	$14,045,334	$15,016,135
Less repairs and replacements	1,944,573	2,447,300
Remainder	$12,100,761	$12,568,835
Net earnings from mining properties	2,000,186	3,113,104
Total net earnings of operating properties	$14,100,947	$15,681,939
Other income—net:		
Interest, rents, dividends received, commissions, etc.	1,011,177	1,077,559
Gross income	$15,112,125	$16,759,499

Charges against gross income:		
Administrative expenses	767,982	758,176
Research and examination expenses	.....	159,618
Corporate and excise taxes	114,198	123,917
Interest and discount on debenture bonds	870,833	950,000
Depreciation and amortization	1,887,399	3,013,543
Appropriations for employees' bonuses and to pension reserve	.....	367,822
Book value of investment securities written down	900,210	306,745
Total charges	4,540,622	5,679,823
Net income for the year	$10,571,502	$11,079,675
Profit and loss surplus at beginning of the year	11,148,223	13,699,726
Profit and loss gross surplus	$21,719,726	$24,779,402
Less dividends on preferred stocks:		
American Smelting & Refining Co.	3,500,000	3,500,000
American Smelters Securities Co. preferred "A"	1,020,000	1,020,000
American Smelters Securities Co. preferred "B"	1,500,000	1,500,000
Total on preferred stock	$6,020,000	$6,020,000
On American Smelting & Refining Co. common stock	2,000,000	2,000,000
Total dividends	$8,020,000	$8,020,000
Profit and loss surplus	$13,699,726	$16,759,402
Assets are as under:		
Property account:	Dec. 31, 1911	Dec. 31, 1912
Net cost of plants and properties	$139,963,733	$140,063,528
Investments in other companies	1,585,670	1,010,537
Metal stocks:		
Ore, bullion, products on hand and in transit	32,473,186	36,141,013
Less unearned treatment charges	5,980,205	6,479,994
Net value	$ 26,492,981	$ 29,661,019
Working assets:		
Material and supplies	$ 2,566,872	$ 2,783,114
Prepaid taxes and other accounts	400,149	327,184
Total working assets	$ 2,967,021	$ 3,110,298
Current assets:		
Cash on hand and in transit	$ 5,890,707	$ 3,809,373
Demand loans	3,192,050	5,935,874
Advances to affiliated companies	333,705	349,744
Accounts receivable	4,236,518	4,387,563
Total current assets	$ 13,652,980	$ 14,482,554
Cash and securities in funds	232,555	229,601
Unextinguished discounts on bonds	704,166	654,166
Total assets	$185,599,108	$189,211,705
Liabilities are as under:		
	Dec. 31, 1911	Dec. 31, 1912
Preferred capital stock:		
Amer. Smelting & Refining Co.	$ 50,000,000	$ 50,000,000
Amer. Smelters Securities Co.	47,000,000	47,000,000
Common stock:		
Amer. Smelting & Refining Co.	50,000,000	50,000,000
Net debenture bonds	15,000,000	14,495,000
Current liabilities:		
Accounts, drafts, wages payable	5,165,065	6,773,297
Deferred payments, interest, etc.	3.645,045	3,014,790
Total current liabilities	$ 8,810,110	$ 9,788,087
Reserve and suspended accounts	1,089,271	1,169,215
Profit and loss surplus	13,699,726	16,759,402
Total	$185,599,108	$189,211,705

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

OIL AND GAS LEASE—VOID ASSIGNMENT

Where a bona fide assignee of an oil and gas lease, with the consent of the lessors, surrenders the lease to them, a person claiming to own the lease under an earlier assignment without any evidence to support it except a void record, cannot prevent the lessors from making a new lease to other parties by inducing them, through false representations, to accept rentals under the original lease.

Midland Gas Co. *v.* Jefferson County Gas Co. (Pennsylvania), 85 Atlantic, 853. Nov. 7, 1912.

OIL AND GAS LEASE—CONSTRUCTION

An oil and gas lease provided for the drilling of wells and payment of royalty on their product or a fixed sum in lieu thereof for a period of ten years and as much longer as oil might be produced. The lessee elected to pay the quarterly rental in cash and did not sink a well until the last quarter of the tenth year, when he drilled a well which produced oil, although in unremunerative quantities. Held, that the lease was binding on the lessor as long as the lessee continued to produce oil and pay the stipulated rental.

South Penn Oil Co. *v.* Snodgrass (West Virginia), 76 Southeastern, 961. Jan. 14, 1913.

RIGHT OF STOCKHOLDER TO INSPECT MINE

A stockholder in a mining corporation has a right to inspect the company's mines. Where such permission is refused by the directors of the corporation, a writ of mandamus will lie to compel them to issue to him written permission to inspect the mine. While this writ may not be enforceable against the persons actually in physical charge of the mine because the properties lie without the state and without the jurisdiction of this court, still the Board of Directors meet within this state and the writ may be enforced against them.

Hobbs *v.* Tom Reed Gold Mining Co. (California), 129 Pacific, 781. Jan. 14, 1913.

INJUNCTIONS IN MINING SUITS

In actions for trespass for removal of ore where an injunction is sought to prevent further taking, it is proper for the court, if there is any doubt in its mind as to the title to the property, to grant an injunction *pendente lite* or to require security to be given, pending the determination of the issue as to the ownership of the ore. However, in this case the appellate court was unable to say that the trial court had abused its discretion in refusing such an injunction and accordingly affirmed the order.

Stewart Mining Co. *v.* Ontario Mining Co. (Idaho), 129 Pacific, 932. Jan. 20, 1913.

DISCOVERY—ELEMENTS OF

The elements of a valid discovery on a mining claim are:

1. A vein or lode of quartz or other rock in place.

2. The quartz or other rock in place must carry gold or some other valuable mineral deposit.

3. The two preceding elements when taken together must be such as to warrant a prudent man in the expenditure of his time and money in the effort to develop a valuable mine.

The requirement of such a discovery is mandatory and cannot be waived by the Department to meet peculiar conditions existing in some mining district. Where in an alleged discovery shaft the country rock was shown to be a granite containing as a constituent element quartz, and there are occasional segregations of the quartz, this does not constitute a sufficient discovery of a lode of quartz or other rock in place.

Jefferson-Montana Copper Mines Co., 41 Land Decisions. 320. Sept. 5, 1912.

Book Reviews

PAST AND PRESENT METAL MARKETS. By W. E. Figgis. Pp. 64, accompanied by two charts, 30 by 38 inches. Published by Critchley Parker, Sydney and Melbourne, 1913. For sale by the *Mining and Scientific Press*. Price $6.

This is a compilation of London monthly average prices for the five metals, copper, tin, zinc, lead, and silver, from 1890 on. Space is left on the charts and in the book for recording similar averages up to and through 1919. The text is brief, but illuminating. The world's production of each metal is stated by countries in percentages, and the chief producing districts indicated. The whole publication affords a convenient means of obtaining quickly a comprehensive view of the world's trade in the chief metals.

MINING WORLD INDEX OF CURRENT LITERATURE. Vol. II, July-December, 1912. By George E. Sisley. Pp. 234, index. Mining World Co., Chicago, 1913. For sale by the *Mining and Scientific Press*. Price $2.

The second volume of this excellent compilation of the current literature of mining, metallurgy, and allied industries, follows the general style of the first volume, issued six months ago. There are improvements in that subjects have been more closely divided and entries are repeated under more subjects. The book includes an excellent author's index. One helpful feature, that will be especially appreciated in mining camps, is the noting of republished as well as original articles. As a whole, the book is an extremely useful one and will save time to workers in many fields.

TOPOGRAPHIC MAP OF COLORADO. By R. D. George. Scale, 1 to 500,000. Denver, 1913.

Only a preliminary edition of this interesting map is as yet available, the main printing having been delayed to permit of making changes in county boundary lines if any such be authorized by the legislature this year. The map has been compiled from data furnished by the United States Geological Survey, the Reclamation Service, Forest Service, General Land Office, railway surveys, and other sources, and incorporating the earlier work of the Hayden, Wheeler, and King surveys. All this has been digested and then supplemented by surveys made by the State Geological Survey, with the net result of furnishing an excellent base map; much the best extant. Topography is shown both by contours and tints in brown. All land lines and cultural features are represented in black, while streams and lakes are in blue. The map is sold by the Colorado Geological Survey, Boulder, Colorado, at prices ranging from 50 cents to $1.55, depending on the styles of mounting. It is announced that a companion geologic map will shortly be issued.

TWELFTH BIENNIAL REPORT, BUREAU OF MINES, COLORADO. By T. R. Henahen; for the years 1911 and 1912. Pp. 200, index. Denver, 1913.

This little book contains, in addition to statistics of production and of accidents, the rules and regulations of the United States Surveyor General's Office and the United States Land Office, tables of altitudes, the official code of signals, instructions for resuscitation from electric shock, and a discussion of the future of mining in Colorado, a review by districts in which a general account of development throughout the state will be found. Incidentally, there is a large amount of technical information. For example, J. R. Curley discusses the carbonate of zinc found at Leadville and the market conditions in the trade; A. W. Forstall tells about carnotite as a supply of radium; the metallurgy of tungsten is described by R. D. George; H. J. Reiling gives brief notes on gold dredging; J. T. Milliken briefly outlines the Golden Cycle mill, while W. H. Staver does the same for the Liberty Bell, T. B. Crowe for the Portland, Philip Argall the Stratton's Independence, and other metallurgists still other mills. Victor C. Alderson describes the experimental plant at Golden, and C. E. Anderson and J. T. Milliken respectively give brief notes on the Smuggler and Golden Cycle electric pumping plants. According to figures collected by Mr. Henahen, Colorado has to date produced metals to the value of $1,187,543,778, and undoubtedly, as he contends, the state is capable of long continued and large production if the industry be properly encouraged.

GAS POWER. By C. F. Hirshfeld and T. C. Uibricht. Pp. 209, ill., index. John Wiley & Sons, New York, 1913. For sale by the *Mining and Scientific Press*. Price $1.25.

The modern gas-engine, whether it derives its power from the gas produced from solid, liquid, or gaseous fuels, is doing good and economical work in all parts of the world, and its use will certainly increase. Up to quite recent times there has been a feeling of distrust in the operation of such types of prime movers, but little can be said on this score now, and units of from 5 to 3000 hp. are in successful service. In many instances it has paid to scrap steam-driven plants for gas-engines, and suction-gas plants, using gas generated from coal, have reduced costs to as low as 12c. per hp-day. With the advent of the Diesel oil-engine, great results are predicted, and have been accomplished, and it seems as if this type will have a wide scope in steamships and power-stations. In the United States, on account of the quantity and cheapness of oil, engines deriving their power from this fuel are used a great deal. The system is also flexible, as in temporary installations an oil-engine can be moved about and set to work as easily as an electric motor. In Europe, the utilization of blast-furnace gas for power purposes has led to the construction and satisfactory operation of large units. In Australia, the suction-gas plant has made great headway, using coal, charcoal, and other fuels, and numbers of installations using from 10 to 250 hp. are working well. In one plant in New Zealand the cost of suction-gas is so low that it is equal to power produced by a hydro-electric station.

The volume under review gives a good insight into the theory of the heat-engine problem, use of fuels as gas producers, development of gas power, details of gas-generators and modern types of gas and gasoline engines, and other interesting information. Every automobile owner and driver should be well versed in the working of his engine, and by a little study of this book should learn something of value.

PROVISIONAL GEOLOGIC MAP OF ILLINOIS. Published by the State Geological Survey, F. W. DeWolf, director. Lithographed by A. Hoen & Company.

This map, which is upon the scale of 1 to 500,000, approximately 8 miles to the inch, affords a graphic summary of a large amount of extremely useful information. In addition to presenting a revision of the mapping of the formations, there is a brief outline of the geologic history of the region and, through colored columnar and longitudinal sections, the revised classification and structure of the rocks is exhibited. Such a map summarized a large amount of detailed work, and, comparing it with the map compiled from then existing material by Stuart Weller and furnished with the first bulletin of the Survey in 1906, it shows what substantial progress has since been made in the study of Illinois. Aside from the scientific material, much that is primarily economic in character is furnished. The oilfields are outlined, the coal, zinc, and fluorspar mines indicated, and a rough summary of the mineral production made. It is not easy to realize the mineral wealth of Illinois, when crossing the level and well cultivated prairie land within its border. In fact, Illinois ranks third among the mineral producing states. In a recent instructive and at the same time interesting address delivered before the American Institute of Mining Engineers, E. W. Parker showed that the geographical centre of mining in the United States falls within Cass county, Illinois, and suggested that the mining experience of a citizen drawn from there might well have been "obtained from digging fresh-water clams in the bed of the Kankakee river." Probably the

Illinois or Sangamon was meant, as the Kankakee does not flow through Cass county, but an inspection of Mr. DeWolf's new map suggests that the erstwhile clam digger need not despair. He may yet become a 'coal baron' or an oil magnate, as both coal and petroleum are found near the borders of the county in question.

ELECTRICAL ENGINEERING FOR MECHANICAL AND MINING ENGINEERING. By H. J. S. Heather. Pp. 332, ill., index. D Van Nostrand Co., New York. For sale by the *Mining and Scientific Press*. Price $3.50.

This book consists of a series of lectures delivered at Johannesburg primarily for resident mechanical engineers connected with the mines. As the author states in the preface, previous to the introduction of electric power through the Rand Mines Power Supply Co., Ltd., and the Victoria Falls & Transvaal Power Co., Ltd., electricity had only been used in minor work upon the Rand. The engineers in charge were used to steam and compressed air, but unfamiliar with electricity in any large way. On the other hand, the electrical men along the Rand, having occupied only minor positions, had no familiarity with the management of men and affairs in a large way. To meet the situation, A. C. Whittome arranged for this course of lectures, in which the problems of electricity are stated, as nearly as may be, in terms of steam and compressed air. Much use is made of analogy, and while stated simply, the book is written for trained and mature men. It is well calculated to meet a widely felt want among mining engineers and will be generally useful. Among chapter headings are: The Electric Circuit; Resistance; Alternating Currents; Electrical Measurements; Continuous Current Dynamos; Alternating Current Generators; Synchronous Motors and Parallel Running Alternators; Transformers; Polyphase Systems; Induction Motors; and The Effects of Running Under Abnormal Conditions.

Cost of Supplies at Montana-Tonopah Mill

During the year ended August 31, 1912, the stamp-mill and cyanide plant treated 53,874 tons of ore, at a total cost of $2.96 per ton, current supplies being as follows:

	Per ton.		Per ton.
Cyanide	$0.58	Water	$0.20
Zinc	0.08	Power	0.54
Lime	0.07	Heating	0.20
Lead acetate	0.04	Refining	0.05
Acid	0.01	Assaying	0.01
Shoes and dies	0.04		
Pebbles and linings	0.07	Total	$1.91

A Land Dredge

Numerous attempts have been made to perfect a small machine operating on land and handling gold-bearing gravel as is done on dredges. The Stephens-Adamson Mfg. Co. has recently built a plant of this type* for the Buffalo Placer M. & M. Co., operating near Dillon, Colorado. It includes: (1) a steam-shovel which delivers to a hopper from which the material is carried by belt-conveyor to (2) a portable gravel-washing plant, tailing being distributed by means of an industrial car system with a belt-conveyor for coarse material. The gold-washing plant is mounted upon quadruple swivel trucks and includes a grizzly made of manganese steel, delivering the fine material to a trommel. The latter has internal projecting bars to break up clay lumps. The gold is caught in ordinary sluice-boxes. Two motors of 25 and 50 hp., respectively, are used. The rated capacity of the machine is 3000 cu. yd. and about 20 men are needed in its operation.

*Described in *The Labor Saver*.

Campbell in coöperation with the state of Pennsylvania. Advance chapter from Bulletin 531, 'Contributions to Economic Geology, 1911,' Part II. P. 23. Ill., chart, map. U. S. Geological Survey, Washington, 1913.

Water-Supply Papers by the U. S. Geological Survey, Washington, 1913, as follows:

GAZETTEER OF SURFACE WATERS OF CALIFORNIA. Part III. Pacific Coast and Great Basin Streams. Prepared under direction of John C. Hoyt by B. D. Wood. No. 297. P. 244.

SURFACE WATER SUPPLY OF THE UNITED STATES, 1911. Part X The Great Basin. Prepared under direction of M. O. Leighton by F. F. Henshaw, H. D. McGlashan, and E. A. Porter. No. 310. P. 210. Map, index.

WATER POWER OF THE CASCADE RANGE. Part II. Cowlitz, Nisqually, Puyallup, White, Green, and Cedar drainage basins. By F. F. Henshaw and Glenn L. Parker. No. 313. P. 170. Maps, ill., index.

SURVEY of a bore-hole drilled by the Vermont Copper Co. in a micaceous and sometimes garnetiferous schist, also occasional hornblende gneiss, showed the following deflection in 1000 feet:

Depth, ft.	Corrected dip.	Depth, ft.	Corrected dip.
100	56°40′	600	32°20′
200	53°40′	700	31°15′
300	49°45′	800	20°15′
400	41°50′	900	20°30′
500	36°50′	1000	26°40′

The hole was started with a dip of 61°30′, and at a depth of 1000 ft. the hole was inclined only 26°40′ with the horizontal.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

ASBESTOS is an alteration product found in veins in older crystalline rocks.

ORE-BEDDING pits at the Copper Queen smelter are 11 by 38 by 800 ft. in size.

WATER pumped from the Superior & Pittsburg mines at Bisbee, Arizona, totaled 1,620,218,296 gal. in 1912.

FLOAT is a term used by miners and prospectors for all fragments of vein matter not in place, however transported.

ANTHRACITE MINING, according to E. W. Parker, is conducted on a margin of 13c. per long ton, equivalent to 11.6c. per short ton.

ORE received at the Mason Valley smelter in 1912 came from 130 different mines, situated in 30 mining districts of Nevada and California.

SAMPLING at the Calumet & Arizona smelter is to be done by Snyder machines so arranged that they will make four cuts, producing a sample weighing 1.6 or 3.2 lb., as desired, per ton of ore passing through.

CHROME-VANADIUM and carbon steel springs have been given service tests by the Illinois Central Railroad Co., and showed 248 and 129% in favor of the former steel in mileage run, and 31 to 54% less in cost.

RADIUM is extremely valuable and sells for a high price. It is quoted at about $80 per milligram. However, the price is largely due to its scarcity and if even a relatively small quantity were made commercially available the market would soon be satisfied.

ELECTRIC POWER used by the Mysore company in India amounts to 3000 hp., which is supplied by the Mysore government hydro-electric power station at the Cauvery falls, 91 miles from the Kolar goldfield. Power is now supplied at per horse-power year.

THE rescue station at the Stag Cañon coal mines of Phelps, Dodge & Co. at Dawson, New Mexico, has eight helmets ready for instant use. A sufficient quantity of oxygen and potash to meet any ordinary emergency is carried on hand. During 1912 there were six fatal accidents at the mines, which produced 1,383,562 tons.

TALC and soapstone are soft minerals that have presumably originated from alteration of other minerals. Soapstone, a talc schist, occurs with other rocks of various kinds, usually crystalline or metamorphic; talc occurs in beds intercolated in schistose limestone and in lenses or pockets in certain intrusive rocks. Miners often use the word talc for any very fine grained soft material found along the edge of a vein. Often such talc is really fine wet clay.

CONTRACT WORK at the Broken Hill South mine accounts for 96.5% of the ore mined and 99.5% of the handling of ore from the stopes to shaft stations, the wages earned per shift of 8 hours being, on development, $4.48; stoping, $4.04; and trammers on ore, $3.38, and on waste, $3.12. All mining at the Waihi mine is done on contract, also a large portion of the work at Kalgoorlie. Filling depleted stopes of the Broken Hill South mine with tailing and ash costs $1 per cubic yard of filling, and 30c. per ton of ore mined.

A TURBO-GENERATOR of 500 kw. of the Allis-Chalmers type, worked continuously for 640 days at the Calumet & Arizona power-plant. It was shut down for two days in October 1912 and the only work necessary in the way of repairs was the truing up of the collector rings of the rotor and cleaning of the oil and water circulation systems. According to the company's engineers, the machine has made an unprecedented record, it having worked for 1637 days between April 22, 1908, and October 8, 1912, with only six days' stoppage.

EFFICIENCY TESTS run on two 5000-hp. hydraulic turbines at the Schaghticoke power-plant, New York, under 56.5 to 86.5% load, gave the following results.

Second-feet of water	208.70	307.43
Effective head, feet	146.91	145.42
Theoretical horse-power	3473.76	5068.46
Kilowatts on switchboard	2007.68	3117.91
Horse-power on switchboard	2691.26	4179.50
Generator efficiency, per cent	95.32	96.68
Turbine brake horse-power	2823.40	4323.02
Turbine efficiency, per cent	81.28	85.30

CARNOTITE ores are found in various counties in southwestern Colorado, and afford a potential source of radium. According to investigations of A. W. Forstall, the radium salts may be extracted more readily from carnotite than from pitchblende, but the process is a delicate one, and for the present the ores can probably be best marketed in the shape of (1) sulphates, including sulphates of barium calcium, and lead with radium sulphate; and (2) uranium and vanadium oxides with impurities. The market is, for the present, in Europe, but active chemical research is being conducted at Denver with a view to establishing an industry in the United States.

A PULP SPECIFIC-GRAVITY BALANCE, invented by H. Stadler, is an apparatus carefully adjusted, with a poise weight sliding on each of three bars, and has a capacity of from 1 to 2000 gm. A glass flask is taken with a capacity of 1000 c.c. of water. The flask being empty and dry, is accurately balanced by the poise weight on the first bar. It is then filled with water, and the poise weight on the second bar, when balanced, will indicate 1000 gm. If the water is emptied out, and the flask filled with a sample of pulp to be tested, the poise weight on the third bar being moved to indicate the accurate balance, the percentage of water in the pulp can then be read off. The apparatus was constructed for Rand slime, and pulp from other districts would need a factor of correction if of different specific gravity.

A UNIQUE COAL-STORAGE BIN has been in successful use at the plant of the Ashland Iron & Mining Co., Ashland, Kentucky. The coal to be stored is crushed fine and is frequently damp, allowing it to pack solidly in the bin and to build up almost vertical. It was consequently necessary to use for storage a cylindrical tank, set vertically, and provided with a conical bottom of slight pitch tapering to the automatic bottom gate. Under this arrangement it is practically impossible for the coal to bridge over the gate under any circumstances. The steel bin is 11 ft. diam. and 35 ft. high, supported on a structure 27 ft. above ground, and has a capacity of 75 tons. It is filled by means of an 'S-A' bucket-elevator, fed by a track hopper and feeder, and is used to supply fine coal to larry cars which feed the coking ovens.

FAILURE to perform annual labor on a claim does not lose or forfeit it; it becomes forfeitable by the locator and locatable by others. It is only when it has been appropriated by another through a new location—a re-location—that it is lost and forfeited by the old owner. Up to the time of re-location, the old owner may, by resuming work upon the claim, redeem his claim from being forfeitable, as provided by statute. Even after re-location has begun, and while the various acts of location prescribed by federal and state statutes are being completed within the allotted time, the old locator may resume work at any time before the completion of all the acts of re-location and thereby render the attempted re-location void, except in Montana, where a forfeiting claimant cannot resume work after a re-locator has posted his notice.

Motor-Driven Charging and Slag Cars

Where cars such as larries and charging-cars are used singly, or at the most in twos and threes, it is often better practice to have them self-propelled by electric motors than to employ a locomotive to move them. With self-propelled cars the system is much more flexible. A car can be moved whenever wanted, without delays incident to waiting for the locomotive, so that operations can be carried on more rapidly and there is much less danger of congestion at any point. The Westinghouse Electric & Mfg. Co. has recently furnished such cars for use at Tooele, Utah, and supplies the following data regarding them.

It has been the usual practice in smelter work to tilt slag-cars by means of compressed air, but motor-tilted cars have been thoroughly tested in certain smelters and are heartily commended by their users. They are low in cost and are simple. Motors for this purpose have proved reliable. Their use does away with the large compressor on the locomotive and with air dumping through the main line, which has often proved troublesome to maintain. Energy for motor operation is obtained from the locomotive trolley. The illustration (Fig. 1) shows a slag-car of the International Smelting & Refining Co., Tooele, Utah, with a Westinghouse No. 6, type K, direct-current motor mounted on the end of the car and protected by a canopy. It is series wound, entirely enclosed, and is dust and weather-proof. It is geared to the tilting mechanism and is designed especially to take care of heavy service of this character and to withstand the high temperature to which it is subjected. At one plant where these motors have been in use for three years, no trouble from any source has been experienced with them.

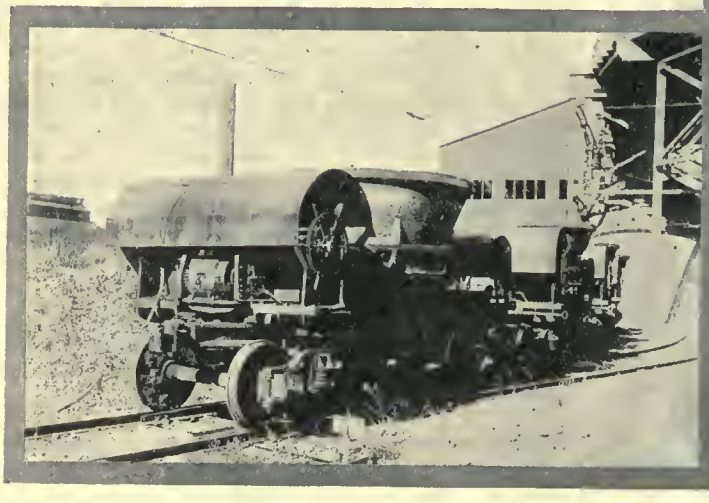

FIG. 1. THE SLAG CAR.

FIG. 2. THE CHARGE CAR.

Fig. 2 shows a motor-driven charging car with two No. 64 motors—one on each truck—of the lead department of the International Smelting & Refining Co. The controller is plainly seen mounted in a horizontal position at the end of the car. Motors and controllers are designed in accordance with street railway practice, but the motors are modified to suit the requirements of this special service. The ability to develop great power in small space is one of their most important characteristics. Another one is great reliability, ruggedness, and ease of inspection. They are built to reduce the amount of attention required to the minimum. Excellent commutation has been secured by the design of brush-holders, commutators, and bearings, and as a result these parts can be kept in service for long periods without necessitating the renewal of any of these parts. The lubrication is simple and adequate for long periods of operation.

The motors for both the charging and slag-cars are made by the Westinghouse Electric & Mfg. Co. and may be adapted to any of the usual type of these cars.

Commercial Paragraphs

JOHN H. BERRIAN, Seattle, formerly with Meese & Gottfried, is now with the Mill & Mine Supply Company.

The sales department of the WAY'S POCKET SMELTER CO. will hereafter be handled at 224 South Spring street, Los Angeles, California.

JOHN WILEY & SONS, publishers of scientific books, will move their offices about May 1 to the eighth floor of the building at 432 Fourth avenue, New York.

CHAS. C. MOORE & CO., ENGINEERS, announce the temporary removal of their offices to 40 First street, San Francisco, during the erection of their new structure to be known as The Engineers Building, at First and Mission streets.

On May 1, 1913, the New York office of the DWIGHT & LLOYD CO., INC., and DWIGHT & LLOYD METALLURGICAL CO., will be removed to the Columbia Bdg., 29 Broadway, New York. Owing to the rapid growth of the business of the Dwight & Lloyd Metallurgical Co. it has been found expedient to form two companies, and the former will handle the North American territory and the latter other countries.

The POWER & MINING MACHINERY CO. is about to open an office at 153 Queen Victoria street, London, E.C., England. A. W. Catlin, formerly of the Allis-Chalmers Co.'s London office, has been appointed manager and he will have entire charge of the sales of the machinery manufactured by this company.

J. W. White, engineering salesman for THE JEFFREY MFG. CO., until recently at its Athens, Ohio, offices, has been transferred to Duluth, Minnesota. Mr. White will look after the sales work of the above company in the following territory: The eastern part of Minnesota, northern Wisconsin, and the entire upper peninsula of Michigan, with headquarters at 1905 East Superior street, Duluth, Minnesota.

WALTER L. GIBSON, who for the past five years has been a silent partner in the FALKENAU ASSAYING CO., of Oakland, has now purchased the entire business and will conduct it under his own name. Mr. Gibson has been associated with the concern more than 16 years and is favorably known all over the Pacific slope. Professor Louis Falkenau remains with the company as general manager and consulting specialist. The same high standard of commercial work and instruction that has made this concern so well known in the past will still be maintained.

TABLE OF CONTENTS

EDITORIAL

WASHINGTON is to spend $12,500 on stream gauging and $5000 on geological and soil studies through its State Geological Survey. Mr. Henry Landes has been reappointed State Geologist.

WATER-POWER regulation within the National Forests does not seem to have checked development unduly in California, as permits have now been granted for development of 700,000 horse-power in that state, 80,000 within the last twelve months.

RESEARCH on problems relating to mining and metallurgy has become so important at the Utah School of Mines that a special appropriation of $7500 per annum has been made for support of the work, and the Director is now looking for a metallurgical engineer who can devote his whole time to the department.

IMPORTANT papers on 'Secondary Enrichment of Silver Ores' by Mr. H. C. Cooke and 'The Geology of Luzon' by Mr. Warren D. Smith, appear in the January-February number of the *Journal of Geology*. Mr. Cooke's paper contains details of an elaborate investigation of the chemistry of silver-bearing solutions, and is an excellent illustration of the service of modern laboratory research to geology. Mr. Smith's paper puts in convenient and eminently readable form a summary of knowledge of the geology of the largest Philippine island.

POSTPONEMENT of further payments on the Boxer indemnity, in order that the Chinese Republic may have opportunity to reorganize its finances, appears to be an excellent suggestion. International relations offer as good opportunity for the exercise of consideration and common sense as does the business world, and despite individual profit that might be won in a scramble to secure preferential advantage in China, it is evident that the greatest good to all nations will follow from aiding China in her struggle to promote civic liberty.

STATE GEOLOGISTS, representatives of the United States Bureau of Mines, mine inspectors, and coal, oil, and gas operators, at a recent conference at Pittsburg, agreed upon a general outline for legislation considered desirable in order to lessen danger due to drilling oil and gas wells through coal beds. In the Appalachian fields in particular the necessity for drilling into or through the coal measures in order to tap the oil and gas has led to grave danger to mines and mine workers. A system of inspection, with rigid requirements as to casing and plugging wells is recommended.

POLLUTION of streams by mill tailing is creating trouble in widely scattered districts. The Coeur d'Alene companies joined in buying easements on property affected and so have cleared their road of difficulty. Mother Lode companies in California have been buying valley land and the Kennedy and other concerns are preparing to stack their tailing. An agreement was recently reached as to the length of time before the new arrangements must go into effect. At the Chino and El Tigre the companies were fortunate in owning riparian rights for miles along the stream. On the western slope of Colorado, where fruit farming contests with mining for popular attention, stream pollution is a live topic. Conferences are being held, and we are glad to note a general disposition to arrange matters amicably, with an appeal to the courts only as a last resort.

ENGINEERS engaged in building construction of any kind have a deep interest in seismological studies, since it is important to avoid earthquake rifts where known, or to take proper precautions when buildings, dams, or other structures must be erected near them. Just seven years ago this week San Francisco suffered from the famous earthquake which taught many lessons in structural engineering. In a recent thoughtful essay in the *Bulletin* of the Seismological Society of America, Mr. John C. Branner points out the immense benefit that would follow from systematic recording of all earthquake observations. At present the Seismological Society is itself the only agency in the United States for collecting and recording such notes. It deserves the hearty support of all engineers. Earthquakes are not nearly so dangerous as cyclones and floods and cause much less damage. They will result in still less when systematic coöperative studies show how to avoid danger zones and how to build to meet shocks.

IMMIGRATION and its problems have been much to the fore in San Francisco this week. It is anticipated that after completion of the Panama canal, 20 to 25 per cent of the immigrants coming to the United States will land at San Francisco, and to provide for them will temporarily tax the community, whatever may be the ultimate benefits. If immigration does not produce problems, it at least intensifies many that are inherent in human relations. The result is largely determined by the mental attitude assumed by the immigrant and the community. In all too many Western towns and districts the incoming immigrant is merely a 'hunkie'—a working machine of uncouth appearance and no human likeness to those of us who came earlier. To those who have this attitude we commend a letter received recently from a Montenegrin soldier, written us from the battlefield before Scutari. No doubt when Mr. Savo M. Dobrkovich worked in the Arizona mines he was merely an 'ignorant foreigner' to the young American who made out his pay check. His letter, however, reveals the fact that in his mental makeup he is much like the rest of us, and his attitude toward war would highly commend itself to Mr. Charles W. Eliot and his associates of the Peace Society. Incidentally, Mr. Dobrkovich is a poet and the author of a small volume of verses published at Cettinge. Have a care, Mr. Shift-boss, the next time you 'cuss out' a clumsy workman: he may be at least as human as yourself.

Flotation and Copper Ores

A small matter is often big with significance, and the recent announcement that the tests with the Minerals Separation, Ltd., process of concentration by flotation, which the Inspiration Consolidated Copper Company has been conducting in a 50-ton experimental plant at the Joe Bush shaft of the company, have proved so successful as to warrant the construction of a 600-ton plant for testing the application of the process to this ore on a working scale, has a greater importance than might at once be inferred. The original plans for the development of the Inspiration property included a 5000-ton mill for the concentration of the ore by ordinary wet methods. The construction of this has been deferred during the tests on concentration by flotation, and if the work of the 600-ton plant proves as satisfactory as have the preliminary experiments, it is reasonable to suppose that the entire tonnage of the mine will be put through the flotation plant, which will be of corresponding size. The experience of the Britannia Mining & Smelting Company, Ltd., will thus be improved upon. The Britannia company, as mentioned in our issue of January 11, after years of unsuccessful experimental work with ordinary wet methods of concentration, has begun the construction of a 400-ton flotation plant. The Inspiration company, in the light of its careful preliminary experimental work, will probably be able greatly to decrease necessary capital expenditure, as the cost of construction of a flotation plant is not over forty per cent of that of an ordinary wet-concentration plant, with a corresponding decrease in overhead charges.

While the matter of capital expenditure in plant construction is an important one, the greatest significance of the success of oil flotation in the concentration of the Inspiration ore, which may be taken as typical in some degree of the porphyry coppers, is the increase in recovery of the copper content. As a round figure, it is safe to say that the companies now engaged in the concentration of ores of this character make about a seventy per cent recovery of the copper. As the copper production of these companies now amounts to nearly one-fourth of the total for the United States, it is evident that the margin for saving is a wide one. Even if the increase in recovery does not exceed ten per cent, the net result is an improvement of one-seventh of the saving now made. The development of a large new mine is an event of great importance; it is worth while, therefore, to point out that such an increase in recovery is equivalent in effect to discovery of new mines. From an economic standpoint, it is a matter of congratulation that such a fundamental change is effected through the use of a patented process, on which a royalty is exacted by the patentees. If by some simple change in ordinary methods production might be so increased by certain companies at no increased cost, the resulting

lowering of what may be designated as the normal standard of production cost would cause the suspension of many other companies which are operating at a cost close to the margin of profit. But where the increase in recovery is offset by a royalty, the law of compensation comes into effect, and working conditions are stabilized. The royalty demanded of the users of oil flotation processes, though it may appear as an unmixed evil to the one who pays, is not utterly iniquitous, as all managers of plants which cannot use oil flotation processes to advantage, will agree. In short, the general use of oil flotation would inevitably lead to a decrease in the cost of producing copper, and, presumably, in its selling price. Such a readjustment would unquestionably prove in the end beneficial to the general public, but, unless it came about slowly, would as unquestionably work hardship on individuals. It is to be expected that in brokers circulars the use of oil flotation by the Inspiration will be designated as "heralding a revolution in concentration methods." It is worth while to point out, therefore, that revolutions are to be avoided wherever possible, as their effects are usually disastrous to industry, for the time being. If the work of the 600-ton plant of the Inspiration proves as satisfactory as has the plant of that size at the Braden mine, in Chile, it is to be assumed that concentration by flotation will be adopted by a number of mines in Arizona and in other parts of the West as well. It is too early as yet to venture a statement as to what changes in the cost of copper production such a change in methods will cause, but we hope they will exhibit themselves slowly.

The Alien Land Bill

California's Assembly has passed a bill restricting ownership of land by aliens, and as a similar bill has already been passed by the Senate, it is expected to become a law. A number of states already have such acts, though they vary as to details. Arizona last year passed a law prohibiting aliens from holding land however acquired, for more than five years. The Arizona statute, however, does not apply to mining claims or lands necessary to the operation of mines. Several of the prairie states impose restrictions on alien ownership of agricultural lands, though the fact is seldom remembered. The right of a state to pass such a law can hardly be questioned, but the policy of doing so is quite another matter.

In our judgment, the California statute is foolish and unnecessary. It provides in effect that no alien may own land for more than one year, or lease for more than five; with proper provision for present owners and their direct heirs, and for minors who may inherit land. This bar to ownership is removed upon the alien taking steps for naturalization. As to corporations, it is provided that "every corporation, the majority of the issued capital stock of which is owned by aliens who are ineligible to become citizens of the United States under the naturalization laws thereof, shall be considered alien within the meaning of this act." This is a direct slap at the Japanese, since their right to become citizens is in doubt, never having been passed upon by the Supreme Court, and the lower courts having held against them. It is probable that the new statute will force the issue and that a final adjudication will be obtained. Almost certainly also, the new statute will lead to strained relations between Japan and the United States, and this is all unnecessary. The number of Japanese in the United States is not increasing, and immigration of Japanese laborers to this country has almost ceased. Whether, in view of the undeveloped condition of our industries, this is a good thing is an open question, but at least the fact is indubitable. It is further to be remembered that the coming of Japanese laborers to the Pacific slope was stopped not by our Government but by the Japanese themselves as an act of courtesy to us. Under these conditions it is peculiarly unwise and discourteous to enact legislation that places them in a different class from other aliens.

California may pay dearly for her new whistle. The rest of the country, which looks at the matter from an entirely different standpoint, is not likely to allow the whole nation to be drawn into serious foreign complications to meet the exigencies of a local political squabble. The remedy is too simple and too easily applied. Congress can at any time remove any supposed bar to Japanese becoming citizens, after which, as they will stand on exactly the same basis as any other foreigners, treatment guaranteed them by the 'most favored nation' clause of treaties, they will have no just cause of complaint. That would not be a bad solution of the problem. The Japanese already here would make excellent citizens. They are thrifty, industrious, and it needs but short experience as an employer to convince anyone that they have no disposition to become 'pauper labor.' The records show that they do not contribute unduly to the criminal and dependent classes, and they have persistently refused to settle in any 'Japanese quarter' or otherwise to be more clannish than circumstances forced. It is worth recalling in this connection that under the preceding state administration the Labor Commissioner was empowered to make an exhaustive report upon the Japanese in the agricultural industries of California. It was popularly supposed that this report would 'make a case' against them sufficient to influence public opinion to the point of passage of an exclusion act. The exact reverse proved true. The report showed such favorable results from introduction of Japanese laborers, and such strong need for more of them, that agitators for Asiatic exclusion have let it severely alone. We believe that in passage of the alien land bill the California legislature has misrepresented local sentiment, as it has undoubtedly failed to appreciate national opinion. We are disposed to trust the President and Congress to find a satisfactory way out, and in the meantime counsel our good friends at Tokyo to have a bit of patience. Prejudices in race matters run deep and are not to be overcome quickly. Japan withdrew from the family of nations for several hundred years and it is not surprising that her complete re-entry involves difficulties.

Mining in the Belgian Congo in 1912

By Sydney H. Ball

*The more important developments of the year 1912 in the Belgian Congo were: (1) stabilization of the copper industry in the Katanga; (2) the successful advance of the placer gold industry; (3) the satisfactory extension of diamond and tin discoveries. Important results may be expected from further developments of either of the latter minerals. The value of the 1912 mineral production of the colony approximated $1,500,000, a paltry sum perhaps, but one gained from a portion of that great white blotch in Central Africa, which in our youth was marked unknown upon even the best maps. In the *Mining and Scientific Press* of April 12, the railroads and other means of transport in Central Africa have been described by S. H. Ball and M. K. Shaler. The successful application of wireless telegraphy in this tropical colony is worthy of the attention of mining engineers operating in isolated regions. In certain influential quarters, public opinion opposed to the Draconian import duties, licenses, and royalties, paid by the mining industry in the Belgian Congo, is growing, augurring for the future a more liberal spirit on the part of the Belgian Government in the development of this distant and difficult country.

REMOVAL OF THE FOREST IS A LARGE FACTOR IN TROPICAL PLACERING

Copper Production

The copper produced in the Belgian Congo in 1912 came from the Katanga copper belt in the southeast part of the colony. The mines are operated by the Union Miniére du Haut-Katanga, in which the Tanganyika Concessions, Ltd., has a 45% interest. The production from this field in 1910 was about 168 tons of copper ore, containing probably 60 tons of copper; in 1911 about 1000 tons of crude copper; the 1912 product is difficult to determine. The single furnace was blown in June 30, 1911, and ran for only 83 days, owing to coal shortages, accidents, and stoppages due to necessary alterations. In 1912 it ran from January 3 to March 4, and from March 23 to April 11, and having started again September 25, continued to run to December 25. Prior to November 25, 1912, the product for 1912 was 2040 long tons, and to December 25 about 460 long tons was produced, so that the total year's product was some 2500 long tons of unrefined copper, equal to about 2300 long tons, or 2575 short tons of refined copper. The crude copper is sold at Antwerp and contains cobalt, which, in instances, reaches 6%. The 1911 product consisted of about 89 to 90% copper, 5½% cobalt, 0.3% iron, and 0.5 to 1% sulphur; but the later shipments, through more complete scorification, had the following composition: 95.5% copper, 1.8% cobalt, 0.86% iron, and 1.1% sulphur. That now being sold contains about 95.15% copper, 3.1% cobalt, 0.74% iron, and 0.76% sulphur. The copper carries no precious metals.

During the past year the technical management of the property has passed from British hands to those of a technical committee at Brussels, composed of two Belgians and two representatives of the Tanganyika Concessions, Ltd. About 100 whites and 1500 blacks were employed at the mines and smelter in Africa, October 12, 1912. The joint committee sent out by the Belgian and English capitalists financially interested in the property at the end of last year, confirm the presence of important tonnages of high-grade ore in the two mines visited (the Star of the Congo and Kambove). They estimate between 270,000 tons of 11% and 180,000 of 11.6% ore above water-level (at a depth of a little less than 100 ft.) in that one of the three portions of the former mine is now under exploitation. Up to an early date in 1912, 20,000 tons had been treated.[1]

The Star of the Congo mine, from which alone at the present time ore is being drawn, is worked by open pits and adits; at present two shafts are being sunk to assist in exploitation. It is hoped that this mine will soon be in condition to furnish ore to two water-jacket furnaces. The Kambove mine, which with others should be connected with the smelter by the Elisabethville-Kambove railroad this coming spring, has a main gallery about 1375 ft. long and some 1300 ft. of cross-cuts. It should be ready to furnish its quota of ore upon the arrival of the

*For comparison see 'Mining in the Belgian Congo, West Africa, for 1911,' by Sydney H. Ball, *Mining and Scientific Press*, January 20, 1912.

[1]Note.—The following estimate of tonnage of ore proved, largely the results of visits made by engineers four or five years ago, may be of interest: Kambove, 1,800,000 tons of 12% (Frecheville); 2,500,000 tons of 14% (Atherton); 3,000,000 tons of 12% (Gibbs, chief engineer for R. Williams of the Tanganyika Concessions, Ltd.); Star of Congo, 435,000 of 14%, and 91% (Frecheville); 1,500,000 tons of 11% (Atherton); 1,200,000 tons of 15%, and 6% (Gibbs); Fungureme, 1,500,000 of 7% (this and the following are Atherton's estimate); Kwatabala, 1,150,000 of 7%; Likasye, 1,000,000 tons of 12%; Kababeba, 1,000,000 tons of 7%; Dikurwe, 800,000 tons of 12%; Musonoi, 600,000 tons of 9½%; Kolwezi, 450,000 tons of 13%; Kakanda, 350,000 tons of 9%. These figures indicate about 884,500 tons of copper, of which perhaps 600,000 tons will be recoverable. In addition, there are 90 other deposits, most of which are much smaller, and on which little or no work has been done. Although the estimates differ greatly, they are sufficient to prove the importance of this field.

railroad. Two prospecting shafts have been begun at Luiswishi, and five at Luishia, two of the copper deposits more accessible to this railroad soon to be completed. In addition to the smelter now in operation, a second water-jacket has been shipped, and will presumably be blown in about June. If labor and fuel warrant it, probably one or more other water-jackets will be erected later in 1913 or in 1914. Early in 1912 a rough sorting and washing plant was erected at the smelter, and by it the silica, alumina, and magnesia content of the ore is diminished and the copper content increased from about 12 to about 16%. A permanent sorting and washing plant is now approaching completion. Further, the fine ore, which gave trouble at first, has been experimentally briquetted, and by June next a briquetting plant with 200-tons daily capacity will be finished.

Smelting at Katanga

The process to be followed in treating the ore is then, rough washing with part concentration, briquetting the fine, and direct smelting. J. Jadot, the chairman of the technical committee, addressing the Union Minière du Haut-Katanga, on December 2, 1912, gave the following summary of smelting:

Period of smelting.	Quantity of ore treated long tons.	Copper-content of ore, %	Total long tons.	Average daily, long tons.	Copper, %	Coke used, total tons.	Coke used per ton of copper.
August 4 to October 23, 1911 (88 days).....	10,341	12-13	996	11.3	90	3434	3.44
January 3 to April 11, 1911 (79 days).....	10,053	13-15	1002	12.7	95	3249	3.24
September 25 to November 25 (61 days).....	7,600	16	1038	17.0	95	2730	2.65

The recovery for the three periods was respectively 69.3, 66, and 80%. Improvements under way will presumably better the latter extraction somewhat. In 1911, European coke, costing about $63 per ton, was used in smelting, but in 1912, a contract was made with the Wankie Colliery Co. to deliver up to 1200 tons of coke per month at something over $28 per ton at the smelter. This coke contains considerable ash and sulphur, but with the completion of a washing plant at Wankie early in the present year its quality should be improved. In 1913 coke ovens are to be erected at the smelter itself, the coal being coked and the gas used for boilers. These ovens should produce from 2500 to 3000 tons per month. In April 1912 a satisfactory trial run was made with Wankie coke and from October 14 to November 25 this fuel was used almost or quite exclusively. Mr. Jadot states that the copper cost at the works during a month when the furnace was in continuous operation, about $155 per long ton of 95% copper, not counting European charges. To this should be added about $45 freight to Europe and market charges. This brings the cost to a little over 9½c. per pound of copper without counting European general charges, interest, and presumably amortization. The cost at the works is expected to be reduced by using washed coal for coking, by coking at the works, by briquetting of fine ore, and by cleaner concentration.

In 1911 a coalfield was discovered at Luano, about 50 miles southeast of Broken Hill, in Northern Rhodesia. A drill-hole about 325 ft. deep is reported to have passed through six coal seams, several of which are exploitable, and one of which is 7 ft. 6 in. thick. The coal is rumored to be about the grade of that of Wankie. This coal is but 375 miles from Elisabethville, but as the route from Broken Hill to the coal is very mountainous, this source of fuel cannot be drawn upon for several years. Reports are current of the discovery of coal six miles from Lake Tanganyika on the Lukuga river not far from Albertville. This is near the survey of the Belgian railroad now being built from the Congo river to Lake Tanganyika. The coal is reported to be a good steam coal of non-coking grade, and its discovery may be of importance if the extent and thickness of the seams, as yet unknown, proves considerable. The coal is said to occur in eight beds, of which one at least is 6½ ft. thick, and to underlie at least 450 square miles. Work preliminary to exploitation will be pushed. Unfortunately, the distance of this coal from the copper fields, together with several transshipments now necessary, prevent its being of much immediate value to the copper belt. Recently, also on the west side of Lake Moero, some carbonaceous shale which may have coal associated with it was found, and drilling is to be done there. Other Katanga localities where coal or indications of coaly matter have been found, are Shiwa and Luweisha, on the Upper Lualaba, and the region of the Lubudi and Lovoi rivers (both western tributaries of the Upper Lualaba river).

Electric smelting is still being seriously considered and 50 tons of ore sent to an electric steel furnace at Ugine (Savoy) is said to have been treated with

GETTING OUT THE PAY. SLUICING ON A CONGO PLACER.

success. The furnace is to be adapted to copper smelting, and, if satisfactory after experiments on a large scale, electric smelting may be undertaken in the Katanga where waterfalls exist suitable for the generation of electric power. A subsidiary company will be floated to finance it.

Labor Problems

To date there has been no apparent shortage of labor at the smelter, but with the enlargement of the plant it is almost certain to come. The country to the south is but sparsely settled by blacks, while to the north the sleeping sickness is a scourge. Prospectors leaving for the northern Katanga country have, however, had great difficulty in recruiting porters even at almost prohibitive prices. The Katanga Labor Bureau was formed in July 1910 to remedy this condition if possible. The introduction of Chinese labor is a possibility. Elisabethville, the principal town of the copper belt, although continually improving as a city, suffered a year of depression. This was due in part to the arrival of more workmen, clerks, etc., during the boom than the country could support, to the intermittent character of the operation of the furnace, and to the unusually severe governmental land laws, and to the, for new country, excessive taxation. Although no particularly large production can be expected in the next year, Katanga should, a year hence, with good luck, become one of the larger copper producers, and certainly the business has in the past six months, taken on a more solid aspect.

Gold Mining

The state budget for 1913 appropriates for operating its gold mines and for prospection, about $477,750. The total gold production of the colony for 1912 will amount to some 1045 kg., valued at about $625,000.

At Kilo, the chief state placer in 1912, about 30 white and 2500 blacks were employed. In the first three months of 1912 about 192 kg. was produced and the year's production was presumably about 750 kg. Previous productions have been 1905, 20 kg.; 1906, 211 kg.; 1907, 325 kg.; 1908, 290 kg; 1909, 659 kg.; 1910, 876 kg.; and 1911, 638 kg. A giant has been installed and a road is being constructed to get in a dredge to work gravels of a large stream nearby the Chari. Pay dirt is also reported from the Nizi.

As described by H. Buttgenbach (*Annales* de la Société Géologique de Belgique t. XXXVI, Bull., 1909, p. 79-86) the region of Kilo is rugged. The valleys are heavily forested, but on the higher points only grass and bamboo grow. The stream bottoms show a greenish homogeneous plastic clay which in places contain white veins, merely the diorite country rock decomposed. Gold penetrates the top 4, occasionally 8, inches of the clay. On this clay rests the pay dirt, consisting of sand and somewhat rounded pebbles, usually one inch in diameter, but in instances 18 in. diameter. The pebbles are largely of diorite and quartz (some of it bearing tourmaline), although others are granite, chlorite, or talc-schist. In some of the quartz pebbles are cavities filled with limonite, containing a little gold, the remains of altered auriferous pyrite crystals. Considerable gold concentration has occurred immediately above the 'bottom.' Both overburden and pay streak vary much in thickness, and either may be 4¾ ft. thick, but average about 1⅓ ft. The gold occurs in grains and nuggets, which are frequently very thin, and is widely distributed throughout the region, but the value from point to point is variable. Workable gravels range in value from $0.45 to $37 per cubic yard. Presumably the gold is derived from pyritiferous quartz veins, but up to the time of Buttgenbach's investigations none had been found in place, and to date, although rumors of rich quartz finds are common, none have as yet been confirmed. Buttgenbach notes that the amount of gold decreases rapidly where the streams pass from diorite to biotite granite country rock, and soon thereafter stops. He found as float a quartz conglomerate showing free gold. The gold is said to be worth about 3470 francs per kilogram.

Sluicing began at Moto, situated about 325 miles southeast of Stanleyville, in the Savanna country, in November 1911. The country rock is said to be diorite and granite, and the gold content, as at Kilo, decreases rapidly where the streams leave the former rock and enter the latter. It presumably produced in 1912 about 200 kg. of gold. Twelve whites (through illness, etc., this number recently dropped to 5) and about 1500 blacks, are employed. The gold is said to be rather fine, and large nuggets rare. Ninety cents to $1.20 worth of gold per yard of gravel is considered profitable. Gravels treated early in the year ran from 2 to 10 gr. ($1.20 to $6) per ton. The deposit is less rich than that of Kilo, but in August 1912 about $720,000 worth of gravel is said to have been proved.

The Nebula-Bokwama state placer was exhausted during the year, its product having been approximately 27 kg. for 1912. The nearby Tele placer of the Belgo-American Forminiére Co. produced during 1912 about 70 kg. Sluicing is here being done on recent creek gravels. The pay, which is quite free from clay, is up to 4 ft. thick, and has a maximum width of 250 ft.. The discovery of several other placers is reported both in the northeastern quarter of the colony and near the German frontier to the north of Lake Tanganyika. It is probable that the exploitation of one of the former will begin in the near future.

Iron Ores and Ore Genesis

A number of the placers in the northeastern part of the colony, which to date has proved to be the most important gold region of the colony, are situated in countries in which hematite-rich rocks (in part, at least, clearly a replacement of schists) occur, and the placers are intimately connected with them. In places these rocks are banded and resemble the itabarites of Brazil. In the latter country gold is frequently associated with itabarite, either as auriferous pyrite disseminated in certain layers of the itabarites (Serra Mantiqueira and Serro do Espenhaco) as in secondary veinlets in them, or as in veins parallel to the schistosity, as at Passagem (Minas Geraes). At the latter camp a vein of quartz, tourmaline, auriferous arsenopyrite, pyrite, and pyrrhotite, dipping parallel to the bed-

ding of the enclosing itabarites, mica schists, and quartzites, has been worked for over a century. In South Carolina, Leiber reports somewhat similar rocks to be gold bearing. Further, similar occurrences are widespread in Africa outside of the Belgian Congo. The gold-bearing quartz lenses at Msalala (German East Africa) are, according to Dantz, in a ferruginous quartzite resembling the

Brazilian itabarites. At Steynsdorp, south of Barberton in the Transvaal, and at the Grant mine in Rhodesia, similar rocks are associated with gold deposits. Ralph Stokes[2] states that the gold-bearing orebody of the Wanderer mine in the Selukwe district, Rhodesia, is an impregnation in banded ironstone, and that the gold content rises with the increase in the amount of iron present (hematite and limonite). In Manicaland, masses of ferruginous quartzite are used by prospectors as gold 'pointers', much as they are in the northeastern part of the Belgian Congo. To date the significance of this association in the Belgian Congo is unknown, for no gold has been found in the hematite itself, and although cut by quartz veins, the latter are apparently barren. The actual source is perhaps the stringers or lenticular veins in the schist nearby (rich gold quartz is found from time to time in the sluices), or in pyrite which in places is abundantly disseminated in the schist. The hematite schist may have merely furnished solutions capable of precipitating the gold, or it may be that the great differences in hardness of the hematite-rich rocks and the adjacent schist or granite, may cause near the contact fractured areas favorable to ore deposition. The analogy between the geology of the Central African plateau and Brazil is close, and the mineral resources of the two regions resemble one another. Not only are diamonds widely distributed over these two regions, but also the association of gold deposits with hematite schists is similar. Further, there are many analogies between the iron-ore deposits of the two countries.

Certain tentative generalizations upon the characteristics of gold placers in tropical countries may be of interest, for in certain characteristics they appear to differ from those of either arid, temperate, or frigid countries. In tropical countries, because of the rapid break-down of the country

[2] 'Mines and Minerals of the British Empire,' p. 242.

rock, both mechanically and chemically, an originally small gold content is collected into profitable placers, where in a country of less active erosion no workable deposit would probably exist. Placers in tropical countries are thus believed to be, even more frequently than in other countries, unassociated with payable original deposits. Due to this same rapid break-down, important detrital deposits are comparatively common in tropical countries. Some occur above or down the slope from well defined veins, as the well known *mantos* of Nicaragua, and the detrital deposits down the hill-slope of the Ruwe gold mine in the Belgian Congo; others are unassociated with well defined veins, as the gold-bearing laterites of French Guiana, which are the more chemically resistant ferruginous portions of auriferous basic igneous rocks. The *flor de tierra* and the veined *canteras* of Venezuelan Guinea are stated by Longridge to be, to all intents and purposes, detrital deposits. In Sarawak, Borneo, much gold is washed from clays, the weathering of auriferous country rock in place. F. P. Gamba[3] states that in southern Colombia "In general the mines of the belt present two types of ore deposits: first, the *mantos*, that is the impregnated rocks transformed into an earthy (saprolitic) material; and, second, the veins more or less regular in formation." At the Eastern mine,[4] on the central part of Kalakabo hill, Araroy district, "the entire hillside to the northeast is covered with quartz from the wash of these veins." This material has been extensively worked for gold by the natives. Due also to the rapid break-down of the country rock and the high transporting power of tropical streams, it is not unusual that natives, with their low working-costs, are enabled, after the rainy season, to return to, and gain a pittance of gold from, streams exhausted the year before. This is frequently the case in tropical South America, and also in Madagascar. Regarding somewhat similar conditions in the diamond region of India, Gardner F. Williams[5] states that "In some of the diamond-bearing districts of India today the native villagers are searching for diamonds exactly as their fathers did in days of remotest tradition. After heavy rains that wash away loose soil, a sprinkling of diamonds may be found in exposed sandstone breccia, and sharp-eyed Hindoos scrape the face of the ground for the precious crystals." And he adds further (page 19): "At the opening of the dry season, thousands of villagers, men, women, and children, began to search every cleft and cranny in the river bed for diamonds. With *ankovas*, or light picks, the men broke and scraped out the diamond-bearing bed and piled the broken ground on the river bank." Not only is the gold of tropical placers, because of frequent shifting of the gravels by the torrential streams and heavy rains, apt to be concentrated to an unusual degree at bedrock, and particularly in the lowest part thereof, but the same torrential rains also frequently cause a concentration at the immediate surface. The lighter material is scoured away, with a resulting gold enrichment at the grass roots. The thousands of 'riffles' formed by the roots of the luxuriant vegetation aid the process. Wallace E. Pratt[6] states that in the Pajo river region, Catanduanes Island, "Owing to the scanty clay covering on the limestone reefs, the gold is very conspicuous. After rains the natives pan over the rivulets which cross the ground, sometimes winning as much as a peso in a day's work. However, test holes over considerable area indicate that the reefs are not rich. They appear in places to be rich because specks of gold may be seen on the surface of the ground. In reality, the few specks that are visible constitute all the gold occurring in that area; consequently the value per cubic metre is low." In valuing tropical placers, these two factors must be taken into consideration. It is probable, too, that in tropical countries the solution of gold from veins and detrital material and its later precipitation upon older nuggets or around new centres of crystallization is more common than elsewhere. This is not only due to the chemical activity of the waters, but also to the abundance of vegetal matter which may act as centres of precipitation. At Ruwe, in the Belgian Congo, the vein contained gold only in a state of finest subdivision, associated with platinum, silver, and palladium, although in the streams heading at the vein, nuggets of considerable size were comparatively common, containing some silver alloyed with the gold, but no palladium. From the greater chemical activity of tropical waters it might be thought that the gold of tropical placers would be unusually fine and contain little silver. Although the gold of some tropical placers is of unusually high grade, this does not appear to be a constant rule, since the purity of placer gold is largely controlled by two factors common to all placers: first, the fineness of the gold in the veins from which the gold was derived; and second, the distance downstream from the original source at which the gold is found. For dredging, the abundance of stumps is a drawback of tropical placers only partly offset by the comparatively thorough disintegration of all bottoms except those of the most resistant rocks. Sluice operations in the tropics is handicapped not only by the rather rapid rotting of wood, but also by the attack of white ants which affect not only wooden sluices, but the timber of dams.

Discovery of Diamonds

The Katanga Special Committee and the Tanganyika Concessions, Ltd., the latter with its ally, the Zambesia Exploration Co., financed in 1911 a company called the Kundulungu-Lualaba Company, to prospect for diamonds in the Katanga. In this region diamonds were found in the gravels of Mutendele creek in 1907, and 95 miles away some eight pipes of kimberlite, the rock in which the South African stones occur, cut the Kundulungu (Permo-Carboniferous) red sandstones. During 1912 the largest pipe (at Luanza) was prospected, but because of labor shortages and the hardness of the rock progress has been slow. A number of stones about equal in water to those of German

[3] *Trans.* Amer. Inst. Min. Eng., October 1911, p. 856.
[4] 'Mineral Resources of the Philippine Islands, 1910,' p. 11.
[5] 'The Diamond Mines of South Africa,' p. 17.
[6] 'Mineral Resources of the Philippine Islands, 1910.' p. 29.

Southwest Africa have been found.[6] Work on a second pipe is soon to be started. M. K. Shaler states that the surface of the Luanza pipe is covered by grass in contradistinction to the surrounding scrubbily forested Kundulungu soil with its numerous flowers. In the decomposed yellow ground a mica (determined by Buttgenbach to be bastite), ilmenite, garnet, and olivine are readily distinguished.

D'Andrimont[7] has recently described his visit to these pipes. Structurally they are, judging from his description and figures, quite similar to the South African diamond pipes, and are as a rule several hundred yards in diameter. The largest pipe, Luanza, is elliptical, its dimensions being about 300 by 500 metres. In addition to small rock inclusions, it contains a large mass of sandstone resembling a 'floating reef.' From the surface down various pits pass through:

	Feet.
Clay, containing quartz pebbles	3 to 6½
Detrital or alluvial clay, with many pebbles, at certain points cemented by iron ('laterite')	6 to 20
Yellow ground, changing into less altered ground at the greatest depth yet reached (about 90 ft.).....	6 to 20

The much-altered yellow ground consists of chromite, amphibole, olivine, an almandin garnet (said by Buttgenbach, however, to be spessartine), and quartz, and in it are rounded masses of sandstone, a schistose calcareous rock, felspar crystals, and rolled fragments of quartz. Concentrates consist of garnet, chromite, olivine, quartz, an amphibole and black mica, besides various rock fragments. All of these minerals are found at Kimberley with the possible exception of amphibole, which may be in realty a pyroxene (omphacite), as suggested by Buttgenbach. The rocks cut by these apparent pipes are of Karoo age, as are the rocks cut by the analogous pipes at Kimberley.

In the southwestern part of the Belgian Congo exist[8] alluvial deposits of diamonds which have been already proved, at least as to certain small yardages, to be exploitable, and in the southeastern portion of the colony, as mentioned above, pipes of a rock exist which appears to resemble closely the kimberlite of South Africa. This rock is at least feebly diamond-bearing, but whether commercially so remains to be proved. The large number of noncommercial kimberlite dikes in South Africa is well known, and if the pipes in Katanga first prospected are unpayable, others may later be proved to be of value.

Tin Mining

A party consisting of several white engineers and some Chinese from the Malaysian tin districts, is soon to leave for the tinfield in the southeastern part of the colony owned by the Union Minière du Haut-Katanga. The work is to begin at Kasonso, and this field will presumably be exploited actively upon the arrival of the Elisabethville-Bukama railroad in 1915. The tin occurs both in pegmatite rock and in placers. As stated in this review last year, a continuation of the Katanga tin belt has been found by one of the companies, and at Muika, near Kiambi, on the Luvua, the same company (the Thys-Jadot group) has recently found some cassiterite-pegmatites and tin alluvium deposits which are now being exploited in a preliminiary way. M. K. Shaler states that the country rock is biotite schist cut by muscovite granite. All these rocks are intruded by pegmatite consisting of sugary white quartz, pink felspar, and muscovite, the last in plates up to one inch in diameter. Specular hematite, tourmaline, and cassiterite are accessories, the latter in crystals up to one inch in length. The tin, which appears to be very unevenly distributed in part, at least, replaces felspar. Tin showings are said to have been traced for two miles. Below the lode is a rich detrital material, probably 40 ft. in maximum width. About 15 whites are now on the ground, and prospecting and preliminiary mining is apparently to be pushed, as ground sluicing is to be started soon and a 5-stamp mill with tables and other machinery is to be erected. In prospecting, about 10 tons of ore carrying 80% cassiterite has been extracted.

The northwest face of the red sandstone capped plateau, called Monts Mitumba, is composed of mica schists, quartzite, and slate, intensely intruded by granites and pegmatites. This appears to be for a distance of about 250 miles a potential tin belt, striking from northeast to southwest. The Union Minière du Haut-Katanga has tin holdings for 175 miles along the southern portion of the belt; north thereof is an extension owned by the Thys-Jadot group, while still farther north along the strike, and in similar rocks, is Muika.

Prospecting and Petroleum

Prospecting has been actively carried on by the Colony, the Great Lakes railroad, and the Société Internationale Forestière et Minière du Congo ('Forminière'), in the northern half of the colony by the last-named company and the Lower Congo-Katanga railroad in the southwestern part of the colony, and by several companies and a considerable number of independent prospectors in Katanga in the southeastern part of the colony. Drilling for oil near Stanleyville by the Grand Lakes railroad has so far been a failure. In the Lower Congo, at the eastern limit of the coastal plain, highly bituminous sandstones outcrop and several small oil seeps occur. It is possible that an oilfield may be developed here.

In the Katanga, in addition to the seven important prospecting companies existing in 1911, two others were incorporated in 1912. There were in all from one to two hundred men prospecting in this region. The larger companies, which have a right to select for exclusive prospecting mineralized areas of from 750 to 3500 square miles, and eventually to choose therein certain areas for exploitation, have already reserved about 10,000 square miles. In addition, about 158 smaller areas for further prospecting had been staked up to July 1, 1912, by prospectors working for themselves or in the names of various companies. The greater number of these

[7] Société Géologique de Belgique, *Bull.* XL, pp. 100-113, Dec. 15, 1912.

[8] S. H. Ball, *Eng. & Min. Jour.*, Feb. 3, 1912, pp. 268-9.

blocks are held for copper, gold, and tin, although bituminous schist, iron, coal, manganese, lead, and salt are also included. Gold placers can be worked at a profit in this region if rather rich; the other finds, with the possible exception of tin, will presumably have to await better transportation facilities, and it will presumably be several years before the value or non-value of most of the blocks is known. Evidently, taking into account the area reserved by Tanganyika Concessions, about 35,000 square miles is withdrawn, at least temporarily, from prospecting in the Katanga.

Production and Stocks of Metals

In the course of his presidential address delivered before the Institution of Mining and Metallurgy, March 13, Bedford McNeill presented the following striking figures illustrating the world's production and accumulation of metals:

INCREASE OF WORLD'S PRODUCTION OF METALS

	Tons, 1901.	Tons, 1911.	Increase for decade, %.
Pig iron	41,000,000	65,000,000	58
Copper	526,000	884,000	68
Zinc	500,000	900,000	80
Lead	850,000	1,100,000	29
Tin	88,000	116,000	32
Nickel	9,000	24,000	144
Aluminum	7,500	46,000	513
Mercury	3,000	4,000	33
Silver	5,300	7,500	41
Gold	380	680	79
Antimony	10,000	23,000	130

Taking gold first, for the 108 years from 1493 to 1600, the average annual production was a little under a quarter of a million ounces. Taking the next 100 years, from 1601 to 1700, this figure approximated to a little less than one-third of a million ounces; for the next 60 years, 1701 to 1760, the output approximated to two-thirds of a million ounces. From the earliest date (1493) until 1840 there was only a gradual rise in production, but from 1841 onward the increase was marked. The discovery of gold in California was in 1848, and in Australia in 1851, and the effect of these two discoveries was shown in the output for the next 40 years. From 1851 to 1860 the average annual output was 6.4 million ounces; from 1861 to 1870, it was 6.1; from 1871 to 1880, 5.6; and from 1881 to 1890, 5.1.

This last date coincides with the starting of the Transvaal output in 1889, which owes so much to the simultaneous successful application of the cyanide process. Then followed an enormous acceleration in output, and in 1911 the total output reported for the world was 22½ million ounces. In other words, the world's present average production in one year is now equal to more than the total production for the 60 years preceding the year 1700.

Another way of bringing the gold production vividly before you is the statement that it is estimated that 653 millions sterling was added to the world's stock of gold for the 358 years from 1493 to 1850, whereas for the 11 years alone of this present century, that figure of 653 millions sterling has already been exceeded by the output of 867 millions sterling. Or again, there has been added to the world's stock of gold during the last 15 years a quantity greater than the total amount previously known to exist in the civilized world.

In the case of silver, commencing with the ten years 1801 to 1810, there was an average annual production of 29 million ounces. This figure dropped to 15 million ounces 1821 to 1830. The successive figures for average annual production are:

Period.	Million oz.
1831 to 1840	19
1841 to 1850	25
1851 to 1860	29
1861 to 1870	39
1871 to 1880	71
1881 to 1890	100
1891 to 1900	162
1901 to 1910	182
1911	252

It is remarkable that for a period of ten years (1901-1910) the weight of silver produced should have been maintained at a ratio as regards gold of 10 to 1, and this notwithstanding the great differences of locality and of the conditions under which the two metals are produced.

TOTAL PRODUCTION OF GOLD AND SILVER

		Gold		Silver	
Period.	Number of years.	Million oz.	Value in millions sterling. £	Million oz.	Value in millions sterling. £
1493-1660	168	41	173	1,490	514
1661-1850	190	113	480	3,320	952
1851-1900	50	334	1400	4,010	750
1901-1911	11	205½	867	2,062	226
Totals	419	693½	2920	10,882	2442

The total figures are not very dissimilar, namely, gold 2920 millions sterling, and silver 2442 millions sterling, but this is explained by the fact that the measurement of value is fixed by gold. The total world's production of silver, from the discovery of America, say 400 years ago, is estimated roundly to have been nearly 11,000 million ounces, and there was, of course, a large quantity of silver in the world before then. Taking the present world's stock, therefore, as being 12,000 million ounces, the value at its present price may be approximated at 1200 millions sterling, more than one-half of which has been added to the world's stock of silver during the last 60 years.

Tasmanian Mineral Output

According to the Tasmanian Mines Department, the mineral production of that state during the quarter ended December 31, 1912, was as follows:

Mineral.	Quantity.	Value.
Gold, ounces	7,774.7	$158,400
Silver-lead ore, tons	22,160	350,000
Blister copper, tons	474	210,000
Tin ore, tons	1,121	$10,000
Coal, tons	12,763	27,000
Wolfram, tons	23	9,800
Bismuth, tons	1.5	2,400
Osmiridium, ounces	142.6	5,000

Copper Mines in Chile—III

By Juan Blanquier

Las Condes District

This important copper district is situated at 33° 10′ south latitude and 80 miles in a straight line from the port of Valparaiso. The altitude is 11,800 ft. The climate is dry and cold, with abundant snow in winter. Rainfall is unusual. The only available means of communication is by wagon-road, 40 miles long, connecting this district with the Central State railroad line. The junction is at the city of Santiago. The road above referred to follows the course of the Mapocho river from its source, where the mines are situated. This river in its lower course crosses the city of Santiago and empties in the Maipo river farther down.

The mining district as a whole is surrounded by dioritic mountains; the characteristic feature being an enormous rhyolite dike over 1000 ft. above the general level of the camp and which has broken the dioritic formation and forced its way through. This dike, probably 3 miles long and 15 miles wide, runs from east to west across a creek formed by two dioritic ranges. To the north and south of the dike and extending for about one and a half to two miles in each direction, is a deposit of volcanic breccia which is bounded by the dioritic formation. A number of dioritic dikes cross the breccia which is formed of pieces of dioritic rock cemented together by a magma of tourmaline. The breccia is the ore-bearing rock.

Enormous orebodies of practically pure chalcopyrite, assaying 24% Cu, occur in the breccia deposit. I recollect that the excavation left after the extraction of the ore from one of these orebodies was approximately cylindrical, 150 ft. deep, and averaging 20 ft. in diameter. The ore extracted and still apparent on the walls of the excavation, is chalcopyrite assaying 24% Cu. There are a number of claims covering the deposits south of the rhyolite dike and a good many mines in operation, while north of the rhyolite dike the deposits have attracted little attention and no work is being done. Of the mines situated south of the dike, two of them are by far the most important of the district. They are close together and show the same kind of deposit.

The 'Disputada' mine, owned by the Perez Ovalle interests, covers an area of about 10 acres in the centre of the district, and is entirely inside the breccia deposit to which reference has been made. The underground work comprises a number of incline shafts and short levels, the deepest workings being at a depth of 430 ft. from the surface. This underground work was done while prospecting for the rich orebodies which occur in lenses. When the first of these was found, an adit 2000 ft. long was run which connected with the bottom of the underground workings. This drains all the water from the mine and is now used for the extraction of the ore mined; all work being done in the levels above the 430-ft. level. Ore is mined exclusively from the rich orebodies, the method of work consisting in connecting these with the main adit by raises. The ore broken runs by gravity through these raises into the main adit, where it is hauled in small cars of one-ton capacity to the dump on the outside.

No machinery whatever is used inside or outside the mine. All drilling is by hand and drainage and ventilation are served by the main adit. The ore coming through this is dumped in an open space. Hand picking is scarcely necessary, as practically all is pure chalcopyrite. Separation of the fine from the coarse is accomplished by hand screening. The fine and coarse are put into sacks separately and shipped to the smelter on mules or in wagons drawn by five mules. The smelter is 15 miles from the mines, and the differences in altitude between them is 7000 ft. Wages average $1.50 per day (10 hours). The cost of mining per ton of ore ready for shipment to the smelter is $1.40. Transportation to the smelter is $3 per ton. The 'Disputada' mine employs an average of 50 men, its output being 3000 tons of 24% copper ore per year. Transportation is discontinued during the three months of winter on account of the deep snow.

The total output of ore of the district averages 6000 tons, carrying about 24% copper per ton, all of which is mined from rich orebodies as described above. In mining them, enormous quantities of lower grade ores have been opened. Under the present condition and method of mining, however, these cannot be worked at a profit. There are in this district some 30,000 tons of ore on the dumps of the different mines which will average at least 6% in copper, the result of the sorting of the rich ores mined. As stated above, practically all the extensive breccia deposit, where the rich orebodies are found, is mineralized, and nearly the whole of it is susceptible of working at a profit by the adoption of modern methods.

The Braden Copper Company.—The Braden Copper Co. is an American concern which works an important copper deposit in Chile. Its property covers an area of 1190 acres and is situated in the province of O'Higgins at 34°10′ south latitude and is 94 miles in a straight line from the coast. The altitude is 7500 ft. The climate is good. There is an abundance of water in the streams and rivers. The rainfall is infrequent, but there is some snow in winter. The mines are connected with the Central railroad line belonging to the state by a private narrow-gauge line 50 miles long and by a good wagon-road 34 miles long, both built by the company. At the junction with the state railroad is the town of Rancagua, with a population of 12,000 inhabitants. This town is in the big longitudinal valley that is the major physographic feature of the country and where fruits, crops, and cattle

are raised. The climate is ideal. The company's railroad starts from Rancagua at an altitude of 1600 ft., ascends the course of the Cachapoal river up to the mines, 7500 ft. high, with a total length of 50 miles.

The copper deposit is in the crater of an extinct volcano, in the contact between the eruptive volcanic tuff that fills the crater and the outlying porphyritic rock. The mineralization occurs all around the edge of the crater in the shape of a deep ring of about five miles in circumference and 160 ft. in thickness, which has been proved to a depth of 2200 ft. from the surface. The development up to the beginning of 1912 has shown 10,000,000 tons of ore of 2.7% copper. Sulphide copper ores predominate from the surface, such as bornite, tetrahedrite,

NEW MILL OF BRADEN COPPER COMPANY

and chalcopyrite, and are found disseminated in a porphyry gangue. The ore is concentrated by water in a mill of 3000 tons capacity every 24 hours. The concentrate averages 20% copper and is smelted, converted, and refined into electrolytic copper at the reduction plant of the company, which is situated a few miles from the mine. The cost of production is given as 7.61c. per pound of electrolytic copper placed upon the market. The annual capacity of the plant is 35,000,000 lb. of refined copper. I may mention that the company has an important hydro-electric plant of 10,000-kw. capacity generated by water-power derived from the Cachapoal river, situated about 20 miles from the mines. Electric power, transmitted from this power-plant, is exclusively used in the mines, reduction plant, and electrolytic refinery. On account of the cheap and abundant power available, the electrification of the 50 miles of railroad to the mines is planned, and an experimental plant of 50 tons daily capacity for treating the concentrate by leaching and electrolytic precipitation is now in operation. If the results of this experimental plant are satisfactory, all the concentrate will be treated by this process in the future and a saving of 2½c. per pound of copper, in the operation costs, is expected. The cost of refined copper in the market would then be 5.11c. per pound. The company has $10,000,000 in stock, the par value of which is $5 per share, the actual market value being $10.37½. More data referring to the Braden Copper Co. may be had from the official reports of that company.

A Company Mine-Rescue Car

The mine-rescue car which has been in course of construction at the Lehigh Valley Coal Co.'s shops at Drifton, Pennsylvania, has now been completed and is fully equipped. Rescue outfits have been kept for the last half dozen years at four central points in the company's collieries, and the mine-rescue car is to be maintained ready to be rushed on call to any point in addition to these previous provisions. The car is a former combination baggage and smoking car. The side doors of the forward half, or former baggage part of the car, have been left as they were, and especially prepared flights of steps are carried beneath the car in order to facilitate the transportation of any injured mine-worker in through the broad doors. The forward compartment, to which easy access is thus gained, contains the operating table, surgical instruments, lockers for the men's clothes, water coolers, and the first-aid supplies, consisting of splints, bandages, absorbent cotton, Red Cross towels, Bellevue gauze, adhesive plaster, picric acid gauze for burns, germicidal soap, tourniquets, and aromatic spirits of ammonia. Hospital authorities were consulted and passed on every point, from the height of the operating table to the medical supplies.

In this compartment there are also six regular United States Army stretchers in overhead racks, a dozen rubber blankets and twice as many woolen ones. Here also are the fifteen big oxygen tanks, held in racks along the wall, and the pump for charging the Draeger oxygen helmets, a dozen of which line the wall at the forward end of the compartment. These hang above the low lockers in which the stores are kept, and which are so constructed that a cot arrangement which will accommodate four men can be placed on top of them. Rows of spare potash cartridges, and of small oxygen tanks, are kept in racks around the ceiling, with tools for any kind of inside work, saws, axes, hatchets, picks, and hand drills for mining, ventilating, and timbering.

The latter half of the car contains a stove for cooking, shelves and a sink, tables which can be stowed away in an overhead rack, and two facing seats which can be converted into a bed. The water-supply is carried in an overhead tank, and both hot and cold water are at all times available. The car is heated by steam, so arranged that a steam hose can be run to it from any colliery, and the radiators have ample heating surface so as to insure comfort for its occupants in any weather. It carries two fire extinguishers to protect the car itself from fire, and two larger extinguishers to be carried into the mines. The car can accommodate 15 men, and while primarily designed for actual rescue work, it is never idle, as it is also used as a demonstration and instruction room for teaching the men at the various collieries this most important work. It is in charge of the rescue foreman, and the men to receive instruction are selected by the mine foremen, but the company issues a certificate to them when they are sufficiently expert, and this may be withheld if they do not qualify.

Organization of Smelting Enterprises—I

By Herbert Lang

The greater number of reduction plants are built by companies or individuals who are already engaged in mining, as a necessary adjunct to their mineral properties. Others are set up in order to enter upon the business of buying and reducing what are called custom ores, that is, ores which are bought and sold in the market. While in the former case policy dictates that the works be put as near as may be to the point of production, in the latter it is generally found expedient to place them in localities central to a large number of producing mines and convenient to good facilities of transportation, which cut a great figure in this kind of enterprise, enabling the most desirable ores to be secured for the processes. Whether the works comes under the one or the other head, the procedure which governs its inception is much the same as in organizing any sort of industrial undertaking. While there is no reason why such enterprises cannot be carried on by single individuals or by partnerships, they are usually maintained by incorporations, upon whose organization may profitably be expended a few moments' study. Such incorporations are commonly managed by sundry officers, whose duties vary but little throughout all mining countries.

Functions of Directors

At the head there is a board of directors—or, as known in some regions, a board of trustees—in whom reposes all the authority of the concern, and which they may, by vote, delegate to subordinates of their own selection. The directors are chosen at regular meetings of the stockholders and hold office as a rule for one year. Their duties vary somewhat with the laws of the country, and also with the degree of their accountability to the stockholders whom they represent. In America these duties are much less stringent than in England, for example, and may be and frequently are performed in a perfunctory and careless sort of way that at times works to the prejudice of the company. Quite as often, however, this apparent looseness and carelessness works to the advantage of the organization, as it devolves the important duties upon those better fitted for it. The English system, by placing heavy responsibilities and wide powers on the directors at home, puts a premium upon ignorant intermeddling; the American, by reposing confidence in able if sometimes dangerous employees, brings out the best or the worst there is in them, and bespeaks a great success or a great failure. The American system makes the best managers and the greatest engineers; the English the best accountants and routine men. The directors in America receive no compensation, as a rule, but on the formation of the company some shares of stock are usually divided among the earlier members as a sort of payment for their services. In other countries they receive so much for each sitting that they attend. The president—in England the chairman—of the board is elected from their number, and he, if he be charged with active duties, may receive a regular salary, although in this country it is often esteemed *infra dig* to accept such. In England the managing directors, generally two in number, who are delegated to perform the services which in this country are supposed to be performed by the president, are in the habit of receiving substantial sums therefore, by vote at the annual meetings of their companies. Business ability is chiefly sought in such places, but social and political celebrity are not without their influence. Technical knowledge is of course equally important as business ability, and it is often remarked that companies are successful in proportion as the managers possess among themselves a practical knowledge of the art in which they have embarked. Although it is often quite practicable to secure technical operatives of approved skill, it is still desirable that the business managers of the enterprise should understand quite fully the requirements of the work in order that the technical staff shall be properly supported in their plans and efforts.

Briefly, the principal functions of the board of directors are: to conduct, manage, and control the affairs of the company; to make rules and regulations for the guidance of the officers and managers of the corporation; to appoint and remove for cause all officers, agents, and employees, and fix their compensation. A majority of the board constitutes a quorum, which has full power to transact business. The officers are, in America, the president, vice-president, secretary, treasurer, and sometimes a manager or general manager. The two former must be members of the board, and sometimes the secretary and treasurer also must be. They severally hold office at the pleasure of the board. The secretary almost universally, and the treasurer quite frequently, are in receipt of salaries, usually quite moderate.

The President and His Duties

The president's duties are to preside at all meetings of the board and of the stockholders; to sign papers requiring the company's signature; to sign certificates of stock; to draw checks upon the company's funds; to supervise and control, subject to the board of directors, the subordinate officers of the company; and to make reports to the stockholders, at their meetings, of the conditions of the company. Such reports are commonly made at the annual meetings of the stockholders, which are an important and in some respects an obligatory feature. The vice-president's duties are confined to serving in the presidential capacity at meetings when the president himself is absent.

The secretary has the custody of the company's seal, which he affixes to such papers and documents as may require it. He keeps a minute of the proceedings at the meetings of the board of directors, and of the stockholders. He keeps the accounts of

the company, attends to all transfers of stock, and has charge of the books. He counter-signs the stock certificates as they are issued, as well as all drafts that may be officially signed by the president. He receives the money due to the corporation and deposits it with the treasurer. He makes out the regular statement of receipts and expenditures which accompanies the annual reports.

The treasurer is the custodian of the company's funds, and pays them out upon drafts drawn by the properly constituted officers. Such is the customary organization of the corporations that carry on the great metallurgical operations of the century.

The General Manager

It has become quite common of late years for industrial companies in America to place the immediate conduct of their affairs in the hands of a manager or general manager, whose duties resemble in a measure those otherwise given to the president, while being of a more practical nature. The manager in such cases stands between the board of directors and the subordinate employees, and also between the company and its customers. All business dealings are in his hands, and the routine of buying and selling is particularly under his control. An increasing tendency is observed among such companies to erect in this manner a sort of one-man power, with the manager at the head, taking away a part of the duties and authority, on the one hand, of the president and board, and on the other of the superintendent of the works. The latter, who in addition to the direct conduct of the works often possesses considerable authority in related matters of business, now finds himself to a large extent confined to the technical management alone.

The Superintendent

The superintendents of most of the more important reduction works are men of technical education and training, as befits their calling. It often happens, however, that whatever the need be of men of this sort, such places come to be filled and well filled by persons whose time has been spent and their experience gained rather in actual practice than in theoretical training. Some of the best superintendents of metallurgical works are persons who have never entered a school of chemistry, but have grown up as it were alongside a furnace or stamp battery, and graduated into responsible places by dint of observation rather than by the study of books. But, however many instances there may be such, the fact remains and must not be lost sight of, that the technical manager of a successful works must be a technical man, and also that the best education for a technical man is acquired, or at least begun, in a technical school. If we divest the superintendent of those duties which are purely of a business cast, such as hiring and discharging employees, signing pay checks, supervising account keeping, rendering reports of the routine work done, buying and issuing supplies, and making returns on ore consignments, in the most of which he is assisted by ordinary clerks and bookkeepers, the remainder relates closely to strictly metallurgical matters, among which are the calculating of the charges for the furnaces, the supervision of the various operations, and the minutiae of tests, assays, and analyses, all devoted to the perfect working of the plant. Thus a considerable amount of business skill is expected of the man in charge, as well as, in the ordinary case, much metallurgical skill of a practical sort. Since there are two sides to these qualifications, the business and the metallurgical, it is easy to understand why the positions of this sort are filled now by metallurgists who have risen it may be from the laboratory or the assay office, and now by business men who have graduated from the counter or the desk. The latter may make the best superintendents, the more especially if they have procured enough knowledge of chemistry to enable them to understand the theory of the operations under their charge. In most cases it is probably better to have a man who has a good business ahead, along with a little knowledge of science, than a truly scientific one who knows but little of the ways of the commercial world. It may happen that the man in charge of even important works may possess no knowledge whatever of metallurgy; in which case it is essential for him to make the best use of that of others. Given the proper kind of subordinates, he may utilize their knowledge to a great extent, and by the use of tact produce equally as good results as the most skilled operators. We can see, therefore, that in these places success is more likely to be achieved more frequently by shrewd management than by individual accomplishments.

Business v. Technical Men

Given a superintendent who is merely a business man, his necessary complement is a metallurgist who is competent to plan and conduct the regular operations of the establishment. This is a scientific person who has spent it may be years in acquiring a knowledge of the principles and practice of ore treatment. He is almost necessarily a school man, and his knowledge of natural science is of first importance to the concern. In small establishments he may be the only technical man about the place, combining the duties in himself of the assayer, the chemist, and the metallurgist. In addition to these he may even act as the superintendent, a position that he is likely in the course of time to be advanced to if he shows any aptitude for the management of affairs. The duties of the metallurgist are to plan and direct the actual operations of ore treatment, he being the technical man, *par excellence*, of the establishment. He is necessarily a skilful and expert chemist, who has specialized upon the lines followed in the works, and he has under his orders the staff of chemists and assayers, his chief business being to correlate the results which they have obtained and apply them to the conduct of the processes. Being regarded oftentimes as the brains of the institution, he exercises in some situations a greater influence upon the fortunes of the company than any one else, his technical skill sometimes surpassing in its effect the best business and administrative skill at the command of the corporation. This fact

is especially true of those metallurgists who are connected with smelting works, who have in numerous cases built up the fortunes of their companies, while profiting considerably, perhaps, themselves. In such works the most marked of their duties consist in making up the charges, as it is termed; which means performing the calculations upon which the ingredients of the smelting mixture are arranged and weighed out. This, it is hardly necessary to say, demands an accurate and wide knowledge of the effects of the different components, as well as a deep working knowledge of the commercial aspects of the business, which vary from day to day and demand the closest attention that can be given.

Metallurgist and Chemist

It is difficult to discover the line of demarkation between the metallurgist and the chemist. Strictly speaking, the chemist discovers facts as to the composition of the bodies before him, while the metallurgist makes use of the facts to carry on the work. In reality, however, the two occupations are but one in many, perhaps most, cases. It is not a long step between making an analysis of an ore, and using the information thus acquired to calculate the charge of a furnace. Accordingly, many chemists perform the functions of metallurgists, and, on the other hand, many metallurgists do their own analytical work.

As might be surmised, it is only in the larger establishments where such a complete division of labor is necessary that both metallurgists and chemists are in control. In smaller and less pretentous ones there may be but a single person to combine all the functions of the metallurgist, the assayer, and the chemist. The difference between the assayer and the chemist is nominal. Originally the difference was that the former worked exclusively by fire methods, while the latter used indifferently wet and dry processes. Nowadays many wet methods, some of extreme accuracy and elegance, have been included in the assayer's curriculum, making his work almost identical with that of the chemist. Consequently the boundary which divided their crafts in years gone by has now become partly obliterated, and it seems that the division is becoming year by year more nominal. The practice in both assaying and chemical analysis has improved vastly within recent years, the increasing number of graduates of technical schools who have taken up such work having had an excellent effect upon the morale and personnel of those branches. Better methods have been introduced and better educated men have taken hold of the work. The useful effect of these schools extends to all branches of metallurgy; while everyone knows how much mining and especially mining engineering owes to the influx of the numerous well equipped young men whom the schools have turned out in increasing numbers within late years. The large majority probably of both assayers and chemists now active are from the technical schools, the most of them endeavoring to qualify themselves for higher work against a time when an opportunity may arise for advancement. Few assayers in particular look upon their calling as fixed or final.

Mining at Highland, Wisconsin

By W. F. Boericke

The Highland field in Wisconsin for nearly fifty years has been worked by lessees for 'drybone' (zinc carbonate) or galena. The field is a typical poor man's camp. The ores occur near the surface, often practically at the grass roots, and no water has to be handled. The ore is easily cleaned, either by hand sorting or by a simple jig, and commands a ready sale. A rich agricultural country surrounding makes living cheap. Timber is plentiful and can be easily obtained when needed. The ground is easily prospected, and with practically no capital but pick and shovel, a couple of men can sink a shaft and start mining. The methods and equipment used are often extremely primitive, but are adapted to the conditions, and no doubt in many cases deposits of ore are worked successfully with them that would not prove profitable with more elaborate means of exploitation. It would be almost impossible to get Western miners to work in the narrow low cramped places of many of these Highland mines, but the native miners are accustomed to it, and take it as a matter of course. They appear to be as much at ease lying on their backs and gouging out a sheet of 'bone' with picks as though they had six feet in which to work instead of four.

Primitive but Cheap Methods

Recently I had occasion to examine a prospect worked by three men on the customary 10% royalty. The shaft was some 35 ft. deep, and entirely dry. A venerable horse, which, it is scarcely necessary to observe, started the whim on the tap of the bell and stopped with mathematical exactness when the 200-lb. bucket reached the top, did the hoisting. No danger of any overwinding there. At the bottom of the shaft we dropped down on our hands and knees and crawled along the track a couple of hundred feet to the face. The drift was scarcely 3½ ft. high, and, as customary, filled on either side with waste rock, only space enough being left for a man to push the car. The lessees were after a 4-in. sheet of 'bone' and 'lead,' which 'made' along the roof in what is locally called the 'brown rock opening.' Their method of working was to gouge out the ore with picks for a distance of 12 in. or so from the face, and then 'bar down the deads,' which broke easily in the slabs, until the face was perpendicular again. The waste rock was used for filling and supporting the roof, though heavy undressed oak timbers were used between the gob walls and the face, the roof being heavy and seamy. Practically no powder was used. These men were making good wages for this country and appeared well satisfied. Under the conditions, they were probably working the little mine with the highest efficiency, for it is doubtful if the ore would have paid for working on a more extensive scale.

On account of the peculiar local conditions, it is usually cheaper to sink a new shaft than to try to handle the ore any distance underground.

Two men would have no trouble in sinking a 50-ft. shaft in a couple of weeks time, and I know of one instance where a 53-ft. shaft was sunk in 17 shifts by two men. The usual contract price is $2 per foot, and the miners figure on making good wages. The ground is so cut up by crevices and 'pitches' that it is usually possible to sink the shaft upon one, which makes breaking easy. Little shaft timbering is needed, except where the ground is loose, and long experience has made the native miners expert in handling such problems. No water is encountered. The entire hoisting equipment can be transferred from one shaft to another in a few hours, and as the ore is usually sent to a distant mill for treatment in any case, the economy of a new shaft instead of a long tram underground is apparent.

THE FIRST STAGE OF WISCONSIN MINING.

A HORSE-WHIM AS USED IN WISCONSIN.

Waste Stored Underground

Under such circumstances, it is natural that no attempt should be made to break any tonnage-per-man figures. In fact, it is aimed to hoist only pay-dirt, leaving all waste behind for filling. One top-man will attend to the horse-whim, place the bucket on the top car, and run it out to the dump, where the ore is subsequently shoveled into wagons and taken to the mill. The buckets used are wooden tubs, and hold about 200 lb. of broken ore. In many of the mines no drilling is necessary, the rock being so soft and broken that it can be taken out with the pick and shovel. Where the formation is harder, hand drilling is adopted for breaking. There are no machine drills. They tell a story of two of the native 'Cousin Jack' miners who had a hot dispute as to how a drill should be supported. One claimed it should be held under the arm, and the other that the proper place was on a man's back. The latter won the argument, and was allowed to demonstrate his theory. When his helper turned on the air, considerable trouble broke loose, and since then drills have not been popular at that mine.

The ore frequently 'makes' in different rock strata, the top being called the 'wool rock opening,' then the 'green bed,' then the 'brown rock,' and the 'glass rock' lowest. These are generally worked separately, each as a floor, with a bench between the workings below. There is considerable difficulty at times in finding a sufficiently strong cap, and heavy stull timbers are needed. Like most lessees, those at Highland have constitutional objections to leaving pillars to support the ground, and this necessitates timbering and filling. As the waste is not hoisted anyway, it makes little difference. Despite the crudeness of the mining as outlined above, the field produced in 1912 about 6500 tons of zinc ore and considerable lead, a very large proportion of which came from the small lessees, whose production in the aggregate makes a respectable figure.

Asbestos in Quebec

Asbestos, as in past years heads the list of the product of Quebec mines in 1912 with a total output value of $3,082,442. After having passed through a severe crisis, the asbestos market is steadily improving. This is especially true of the higher grades, crude, and long-fibre mill-stock. The demand for the short mill-stock is not brisk, and as a consequence, the qualities under $30 per ton have to be sacrificed to some extent. Under these conditions, therefore, with good prices for high-grade stock, and low prices for short mill-stock, it is quite easy to understand that only the mines which can produce the better qualities are able to operate profitably. By reason of these circumstances, none of the mines of the Broughton district operated during 1912, as the Broughton rock is essentially a milling rock, containing, as a rule, a good percentage of disseminated fibre but short and low in value. A similar remark applies to most of the mines of the Robertson district. On the other hand, the Thetford mines and the Black Lake mines worked steadily.

The Rio Tinto Copper Co., of Huelva, Spain, mined 2,406,969 tons of ore during 1912, of which 688,861 tons of pyrite ore was shipped, and 977,812 tons of sulphur ore delivered. Copper sold amounted to 39,925 tons which sold at an average of £73 1s. 3d. The gross profit on products sold was £2,274,000, and net profit £1,935,000. Dividends of £4 10s. per share were paid, and £194,600 carried forward. The directors state that the demand for pyrite and sulphur ore continues to increase, and the outlook for the price of copper is satisfactory. The water supply for the leaching process at the mines is lower than usual, and will need careful use.

West Australian State Mill System

*The number of state mills in commission at the present time is 36, and two tin-dressing plants. In 1910 the number was 34, and in 1911, 33. During the past year a new mill has been erected at Meekatharra and another at Mt. Ida, to replace the original mills at these centres, which had been run till worn out. In addition, newly erected state mills have been opened at Payne's Find and Mt. Egerton, which are comparatively new districts.

In the Marvel Loch district the state has, by financial assistance to private mill-owners made provision for public crushing facilities under government rates and conditions. At Mt. Jackson a plant has been leased by the government, and at Weston's public crushing has been provided by a subsidy to a private company. Construction of a mill at each of the following places has been approved: Mt. Keith, thirty miles northeast of Mt. Sir Samuel; Bamboo Creek, Ora Banda, and Norseman. Provision is also being made for the acquisition or the erection of a tin plant at Wodgina.

To the end of September 1912 the quantity of ore crushed at the state batteries amounts to 884,684 tons, which has realized gold to the value of $15,500,000. From cyaniding, an additional amount of $2,000,000 has been recovered, and from slime, $420,000, the total amount realized by the state mills being $19,080,000. The capital now invested in the state battery system amounts to over $1,440,000.

Graphite Production and Importation

†Natural graphite is the product of different geologic agencies, mostly related to the heat of the molten magma which, during periods of convulsion, has penetrated the overlying rock strata from the earth's interior. It has two forms: crystalline, or as it is known to the trade, 'flake' graphite, which occurs as small flakes disseminated through crystalline schists, and amorphous graphite, which has no grain or structure. Coal beds in some places have been turned into graphite by the confined heat of intruded molten rock, and this natural phenomenon may have suggested the feasibility of manufacturing artificial amorphous graphite, an industry which of late years has become of considerable importance in the United States. Importations of graphite, however, largely exceed domestic production, the figures for 1912, according to the U. S. Geological Survey, being for the imports 25,643 short tons, valued at $1,709,337, and for the domestic output, 2445 tons of natural graphite, valued at $207,033, and 6448 tons of manufactured graphite, valued at $830,193. The island of Ceylon is the greatest contributor to American imports of graphite.

Graphite is a mineral of great and increasing industrial importance and has many uses, though the graphite from any one source or mine is not adapted to all these uses. One of the oldest and most important applications of graphite is in the manufacture of crucibles for use in the steel, brass, bronze, and other industries. Such crucibles must have good tensile strength, and for their manufacture a fibrous or flaky graphite is used, the interlocking of the fibres adding to the strength. Ground Ceylon lump graphite is the material most in favor in the United States for making crucibles, although small amounts of American flake graphite are also used. Amorphous graphite has never been successfully utilized in crucible manufacture, except for very small crucibles.

The U. S. Geological Survey has just published, as an advance chapter from 'Mineral Resources' for 1912, a report on the graphite industry in the United States by Edson S. Bastin, which also includes figures of importations into this country as well as statistics covering other graphite-producing countries. For copies, application should be made to the Director, U. S. Geological Survey, Washington, D. C.

Petroleum Possibilities of Tierra del Fuego

‡Emanations of inflammable gases were observed at Qumas Malas, Rio Tres Brazos, Rio de las Minas, Cabo Boqueron, Rio Tres Puentes, Peeket Harbour, and Seno Otway. In the first four mentioned localities, the gas comes from Tertiary marls, and on the last three from Tertiary sands of a different age from the marls. With one exception, all of these beds are lower than the coal deposits of the region, which precludes the possibility of the gases having originated in the coal. The occurrence of gases in connection with oil seepages was observed in the valley of the Tres Puentes river, along the Tres Brazos river, and in Cape Boqueron. The gas emanations at Rio Tres Brazos, Rio de las Minas, Rio Tres Puentes, and Seno Otway, are associated with faults, which also probably occur near Cabo Boqueron and Pecket Harbour. An anticlinal fold was observed at Queman Malas, north of Cape Yarta. As the oil indications are found at different horizons throughout the Tertiary and always near faults, and other hydrocarbons derived from petroleum and deposited by the waves have been ascertained as coming only from Cretaceous rocks, it was concluded that the oil originated in rocks of Cretaceous age or older. Three wells have been drilled in the region, the deepest to about 175 metres. These wells have been placed without regard to geological conditions affecting the accumulation of petroleum, and the resulting failures in no way deter from the prospective importance of the deposit. The geological map accompanying the report shows the structure and geology to be continuous on both sides of the Strait of Magellan, and to consist of a northeastern dipping monocline of Cretaceous and Tertiary beds, covered by glacial deposits and faulted at several points which are situated apparently along a well defined zone. As a result of this investigation, it is considered that the existence of petroleum in the vicinity of Punta Arenas and in the northeastern region of Tierra del Fuego is proved.

During 1912 the Calumet & Hecla crushed 2,806,610 tons of 'rock'; Mohawk, 787,941 tons; Oseeola, 1,246,557 tons; and Quiney, 1,309,253 tons. Steam-stamps are peculiarly characteristic of the district.

Trinity County Gold Districts

By W. S. G. Todd

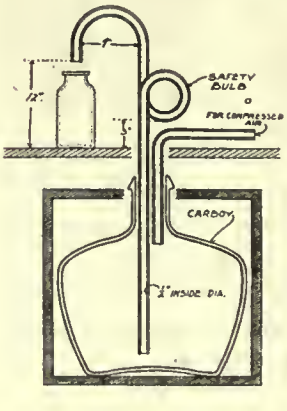
No comprehensive geological report has ever been published by either the United States or the State Mining Bureau on Trinity county, California. It is true that an incomplete report on the Carrville, or Trinity Center, country has been published, and one on the gravel deposits of Weaver basin, in which is situated the La Grange mine, the largest hydraulic mine now in operation. There is, however, nothing on the vast country lying west and north of Weaverville, which where prospected shows a network of veins and also coarse placer gold in every stream. From the east the first district in this mineral belt is that of Cañon creek, in which are situated the Globe, Chloride-Bailey, Mason & Thayer, and other mines. The three mentioned were recently purchased by the Craig Mining Co. of Canada.

The next district, to the west, is the East Fork, beyond which lie the Rattlesnake, the Grizzly, and last the New River district. The last three districts can be reached only by trail, but one may reach the East Fork district by a good wagon-road. In it is the Enterprise mine, which has a drift on the vein about 1200 ft., and is fairly well equipped with 10-stamp mill, compressor, and electric-light plant, but does no custom work. The main part of the district lies from two to five miles north, all of it being still in possession of the original locators, and all in the earlier stages of development, excepting three prospects that have been taken over by capitalists within the past four months. Development is practically all done by driving on the vein, and in amount it varies from a few feet to about 400 at each property. The main veins strike northerly and southerly, generally dipping east 65° or more, and varying in width from one to several feet. Some are traceable for a long distance on the surface. While no large orebodies have been developed, some high-grade ores have been extracted, picked samples assaying several thousand dollars per ton in free gold and sylvanite. Nearly all can show high-grade ore.

This country has a good climate, and the elevation ranges from 2100 ft. to about 8000 ft., culminating in Thompson's peak in the Salmon range. The country that is being developed is below 3500 ft. above sea-level. Three feet of snow is considered heavy. It comes in December and January, and is gone in the lower part of the district by March, and in all but the very high parts (above 5000 ft.) is gone by May. There is plenty of timber, fairly good water-power, and mineral enough in sight to justify further development. The men who are developing this district are experienced hard working miners, who are spending their time and money in development, believing that their ore dumps were their best advertisement. There is an especially good field here for a custom mill, but also other opportunities for investment.

Siphoning From Carboys

The accompanying sketch illustrates a convenient apparatus for siphoning acids and ammonia from carboys, described by E. G. Jarvis in the *Chemist-Analyst*. The larger thistle tubes are made of ½-in. glass, and are inserted into a rubber stopper placed in the neck of the carboy. Air pressure is used for elevating the liquid.



Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Mine Administration and Mine Bosses

The Editor:

Sir—Genetically the race may be divided into two divisions, those who eat like hogs and those who do not. To the former belong the genus miner or those who dig for mineral.

'A Miner' complains that the superintendent eats at a private table. Well, what of it? No superintendent would mind eating at the same table as his men if the men would eat decently. But they don't. A miner imagines no one can be of any account unless he shovels food with his knife. Let the 'Super' do this and he is one of them. Try putting butter-knives in the butter. How many miners will use them? None. In go their dirty knives which have already done duty for forks and spoon. Here a miner spits on the floor when at meals, there another blows his nose with one hand while with the other he is 'mucking' food with a knife for a shovel. Any man, superintendent, assayer, or millman, that can stomach this is a marvel. Do you wonder that the 'Super' has his private table? Let the miner eat like a civilized being and the 'Super' will be only too glad to eat with him.

The miner's idea of a superintendent is an enlarged miner, one who can chew a plug a day, drink more than any two miners, and who is mixed up in all the town tragedies. The miner does not stop to consider that the days of mine superintendents have passed and we have come to the time when a superintendent must be a trained specialist in mining as well as in metallurgy. How many mines nowadays can be run by Pete? None. Pete was very well in days gone by when mines were rich from the grass roots, but poor Pete has not kept pace with the specializing of miner's work. The trouble with Pete is he is looking for the very shift-boss he has so frequently vilified. Put in a pleasant-speaking educated man as shift-boss, and Pete cannot realize that he is to be treated as a human. No, Pete expects abuse and wants it, and he often deserves it; for of all the unthankful, undeserving, shirking men, Pete the miner is the limit. Did anyone ever hear of a miner trying to help a 'Super' by doing faithful work underground? Never. His whole business in life appears to be a struggle to do as little work as possible and receive as much as possible, but for the interest of the mine, of the superintendent who is trying to make both ends meet, he does not care a rap. Why does a mine require a foreman and a shift-boss on each shift? Simply because our precious miner Pete will not do his work without someone watching him.

In all small mines—and the majority are small—Pete is the deciding factor. If he would only try to keep up his end, there would be more mines now paying. But what does Pete care? He is ready to throw his blankets over his back and hike to the next camp. Underground, does the miner Pete help the 'Super' at all by economizing in his fuse or powder, or does he try to break clean ore? I guess not. All he is thinking of is the time to quit. If Pete has had a dose of socialism thrown into him, then he is more worthless than the worst. It gives him the impression that he is as good as anybody and that he should be running the mine.

Pete imagines because he can polish the head of a drill that he understands mining. Mining in its broadest sense is far more than this. The miner knows very little about the mine, although he imagines he knows it all. Does he know how much money the superintendent has on hand for doing certain work? Does he know what the ore runs, or what the saving of the mill is? No. He knows about as much of the mining business as a conductor of a car does about the management of a city electric rail system, but such is the faith in gold mining that Pete the miner imagines he knows it all, and worst of all, he has impressed this faith to a great extent upon the public.

Any mine superintendent that takes the advice of Pete in the management of a mine is far worse off than the relative-superintendent that tries to run a mine, for in the latter case the relative may have the sense to employ under him competent men, while Pete's advice is sure to lead to ruin. Let Pete stick to his business of mining or 'mucking,' and by mining in his case I mean hammering a drill or running a machine, and let him do that business well, and let him try to help the mine superintendent to achieve results instead of hampering him in every way, and so many dead mines would come to life that Pete would always be sure of a job.

Years ago I asked a well known engineer what the main factor in successful mining was. I wonder what Pete would say—whisky, I presume—but my man probably included this when he said, "young man, the principal factor in mining is the study of men."

MINE SUPERINTENDENT.

Jackson, April 1.

Bolivian Mining and Placer Lands

The Editor:

Sir—A few words in addition to I. Dalland's article in the *Mining and Scientific Press* of March 22 may be in order. The mines and mineral lands, as well as the gold placers of Bolivia, are subject to a leasehold system, yet in the language of the law (*son perpétuas siempre que se pagan las patentes*) are perpetual as long as the dues are paid. These amount to 2 bolivianos (equal to 80 cents) semi-annually for each pertenencia or hectare, or 10,000 square metres, equal to 2.47 acres. The dues for agricultural or any surface-land on the Andean plateau are ½ boliviano, equal to 20c. per hectare annually. Besides these dues, the lessee has to take out a patent for his concession, once for all, for 1 pertenencia or any number of them. This costs 10 bolivianos, or $4. The land law in the tropical part of Bolivia, toward Brazil and Argentine, is different. The rich agricultural and grazing land where large herds of wild cattle roam, is sold for cash at 10c.

per hectare, up to the number of 20,000 hectares. Forest lands with rubber trees cost 40c. per hectare. The application for mine or placer land has to be made at the Prefecture of the department in which it lies. There are nine of them in Bolivia. There is the capital of La Paz, the department of La Paz, and the province of La Paz, with their various administrations all in the same city. The department of La Paz contains by far the greatest number and the richest of the placers and gold quartz mines, and Mr. Dalland had to get his concession in La Paz. There he had the opportunity to buy his pack-animals and the whole outfit of tools and material for his enterprise. There are good hardware stores in that city furnished with all that is necessary for prospectors and miners. It is easy to get to La Paz. All the railroads in Bolivia have Pullman and dining cars, and there are many good hotels in that city. The Government cautions all to go out first to prospect, which costs nothing, and after having found a suitable location to send or come to the Department de Fomento at La Paz to obtain the patent.

G. W. Wepfer.

Berkeley, California, March 25.

Extralateral Rights and the Prospector

The Editor:

Sir—I fear you have not quite grasped the kernel of the argument in my communication of March 12; for in your comments thereon you write: "the position taken by Mr. Van Wagenen is, in effect, that there can be no mining development without the special inducements to prospecting that have heretofore been given in the western United States." Now I cannot find any warrant for such an inference in my letter. I did say, however, that outside of our favored West "there are no new discoveries, except such as are made by pure accident." The difference is important. There is much mining development all over the world, even in such antiquated regions as Asia Minor. But these are all on *antiguas* of more or less antiquity. There are, and can be, very few discoveries in such places, for the simple reason that no one is on the search.

I shall await with interest the response from your "Canadian friends", secure in the faith that there will be none. In all the broad expanse of the Dominion, from ocean to ocean, and Lakes to the Arctic, I have yet to hear of the first new discovery during the year 1912, by a prospector. Yes, there are generally plenty of men in the hotels of Toronto and Quebec with claims to sell, but we all know that these are claim peggers and promoters, not prospectors. The real prospector would probably not be a welcome guest at these places, even if he could pay his bill. The fake ones, to whom you refer, probably could not hit the top of a drill twice in succession. And, by the way, why not print extracts from some of those letters that "burdened your mail" on this subject some time ago? It looks as if it might be a very easy way to destroy my position.

It is a pleasure to know that the veteran prospector, Pat Hannan, is still alive and hearty, but very sad to reflect that he is the only Australian example you could mention. Perhaps, in sixty days or so from now you will have a list from your Melbourne correspondent. But I note that in referring to mining conditions in general in the Commonwealth you fall again into the common error of confusing the prospector with the claim-pegger and promoter, when you say "It needs but the rumor of a 'strike' to bring them in by hordes." Too true. They hang to the skirts of the true prospector as the barnacles to a ship, and the sutlers to an army, carefully dodging all the hard work, and generally managing to reap the bulk of the harvest. But the 'strike' must come first. The 'hordes' that follow are not prospectors. Let us be a little careful about our words. I suppose it will be a few weeks before your mail will be "burdened" with the names and addresses of prospectors from Mexico and other Latin American countries, so that point may be dismissed for a while. Perhaps the most of the poor fellows in Mexico have been executed by this time.

A few words as to your final remark. You say "it is a common fallacy to assume that the old way is the only way." Well said. But the new way is the one that was inaugurated when the existing mining law went into effect, which has proved its worth by its results. The old way is the one to which you seem to wish to return. I must respectfully but firmly decline to be put in the old fogy class, but if, in this matter, you chose to line up with them, it will be quite out of keeping with the general up-to-dateness of the *Press* in all other subjects.

Theo. F. Van Wagenen.

Denver, April 1.

[One who writes as vigorously as Mr. Van Wagenen need have no fear of being placed in the 'old fogy' class, however much those of us who may be urging any particular reform may find him opposed to that specific change.—Editor.]

Costs at McKinley-Darragh Mine, Cobalt

During the year 1912, 52,482 tons of ore was treated, yielding 2,089,593 oz. of silver, and costs were as follows:

Operation:	Per ton milled.	Per ounce recovered.
Mining and development	$2.259	$0.0569
Milling	1.248	0.0315
Sampling and assaying	0.113	0.0029
Bagging and loading	0.168	0.0043
Surface maintenance	0.249	0.0063
Insurance, taxes, administration	0.735	0.0185
General charges	0.275	0.0069
Total production costs	$5.090	$0.1284
Marketing:		
Sampling at smelter	0.045	0.0011
Freight and insurance on ore	0.458	0.0116
Smelter charges	1.465	0.0370
Total marketing costs	$1.968	$0.0497
Total costs	$7.058	$0.1781

Stamp-duty at the Goldfield Consolidated mill averaged 9.44 tons per day during the 14 months ended December 31, 1912.

Special Correspondence

BRITISH COLUMBIA

NEW PLACERS ON SILVER CREEK.—TRAILS AND TRANSPORTATION

Information concerning reported finds of placer gold on creeks south of Tesline lake, in Atlin mining division, northern British Columbia, has been attracting some attention, though as yet particulars are meagre. Most published accounts lack definite details as to whether or not gold has been obtained in any quantity above a few dollars' worth, but one press despatch from Skagway, Alaska,

MAP SHOWING ROUTES TO NEW PLACER FIELD.

dated March 22, states that one man has arrived in Atlin "with several thousand dollars worth of washed gold, the first brought out from the scene of the new strike."

A communication from W. Scott Simpson, Indian agent in the Stikine River district, which lies south of Atlin mining division, dated March 2 and addressed to A. M. Tyson, inspector of Indian agencies for northern British Columbia, has been published. It is to the effect that at present there are but few of the older Indians on the reserve at Tahltan village, the majority of the men being now in the vicinity of Silver creek, a tributary of Teslin river, which joins the river about 35 miles south of Teslin lake, into which latter the river flows. Mr. Simpson reports that on February 5 a deputation of Indians waited on him and produced a letter which had been sent to them by Atlin Indians, stating that they had found new placer diggings on Silver creek. The Indians requested him to accompany them on a claim-staking expedition and to see that their record papers and lay-over permits were properly made out. Thinking it might lead to the ultimate prosperity of the Indians, he accompanied the party, which on February 7 left Telegraph Creek, a settlement on Stikine river, and on March 2 returned to that place, after having staked claims on three creeks. The Atlin Indians produced an ounce and a half of gold they had obtained there last fall. Those Indians had obtained free miner's certificates and staked claims last November on the best-looking parts of the creeks. Various Indian tribes have staked claims to an estimated number of about 300, and white men have about as many. Under existing conditions of snow and frozen ground, it is difficult to say whether or not the new diggings will prove profitable to any considerable number of miners; it is probable that many of the claims will prove hard work.

Three routes to the new field have been mentioned in newspaper notices. One is *via* Whitehorse (in southern Yukon Territory) up the Hootalinqua river to Teslin lake, and down the lake to its southern end, which is about 35 miles from the new field. Another is *via* Skagway to Carcross (Caribou Crossing) by railway, thence to Atlin, and from that camp by trail east to the creeks under notice. The third is by Wrangell, in southeastern Alaska, and Stikine river to Telegraph Creek, and thence by trail.

H. E. Young, provincial secretary in the Government of British Columbia, who late in March returned from a visit to Atlin after having made many inquiries, has concluded that the best way will be for the Government to open a trail from O'Donnell river at Atlin (on which river new placer-gold finds were made late last autumn) to the new diggings, which he is informed can be reached in 90 miles from the town of Atlin. He sent in a party of men by the old longer trail up Surprise lake to north of Gladys lake and then south—a distance of about 150 miles—and instructed them to return by the proposed shorter route to Atlin *via* O'Donnell river. On receipt of their report, he will, if it be favorable, recommend the Government to at once open the proposed new trail.

Information received from Nahlin by newspapers during the first week in April was as follows: "Two men who came down the trail on April 3 from Silver creek report that J. Fuller, owner of No. 2 Below Discovery on Silver creek, has reached bedrock after having passed through five feet of gravel. He took out coarse gold to the value of 75c. per pan, which is regarded as good pay. Prospects on other creeks appear to be favorable, but bedrock has not yet been reached on these. There is a small town of tents on Johnson creek, and other creek benches are being dotted by the tents of new arrivals." Nahlin is a telegraph station, about thirty miles from Silver creek. Still another published report is that Robert McKee, well known in Atlin camp, has been to Seattle with $400 in Silver creek gold. Among other statements made public is one that the reported finding of new diggings is only a scheme to enable Indians in the district to profit by selling placer claims they have staked. This may not be true in all cases, but it is known in Victoria, British Columbia, that a number of claims held by Indians are for sale. Remembering, too, the customary exaggeration on the part of those interested chiefly in inducing men to spend money in traveling and outfitting, whether or not there be a fair prospect of the new diggings proving sufficiently productive to warrant the outlay necessary to reach the locality, it would appear to be well for those intending to go to the Silver Creek country to await publication of authentic information from known reliable sources before undertaking what might otherwise be a profitless journey. It is not inherently improbable that important placers have been found, but as yet the evidence produced is insufficient.

NEW YORK

MARKETS CONTINUE DULL.—COPPER REPORT ENCOURAGING.—TENNESSEE COPPER TO MAKE PIG IRON.

The actual settling down to work of the two Houses of Congress, and the address delivered to them in person by the President, all looking to the earliest possible passage of a new tariff enactment, have not been without market effect. The realization that new tariff schedules are to be made, that a large part of the revenue heretofore provided by the customs service is to be wholly foregone and the deficit so created made up by the imposition of an income tax, comes with something of a shock, even though thoroughly threshed out in the recent national campaign. There is a noticeable slowing down of business and an increasing general tendency to complain of conditions that permit the carrying on of operations but preclude the winning of any profit.

The statement of the Copper Producers' Association covering March operations was about as anticipated. It had been expected that the exports might reach a record-breaking figure, but the total was 77,699,306 lb., which has been exceeded on three different occasions. In view of the unsettled conditions prevailing abroad, the reaction in Germany, the hoarding of actual cash in France, the market dullness in England, which latter country is also afflicted with an undue amount of political agitation, it is not strange that there should be some question raised as to the shipments of copper across the Atlantic. There has been quite a little open skepticism as to the destination of these copper cargoes. Should the export demand continue so close to record-breaking figures, we will probably hear once more the stories of 'hidden copper stocks' abroad. The domestic consumption for the month is the more genuinely gratifying figure, home consumption accounting for 76,585,471 lb., making a total consumption for the month of 154,284,777 lb. Production was 136,251,849 lb., which makes a shrinkage in accumulated stocks of 18,032,928 lb. Stocks on hand as of March 31 were 104,269,270 lb., which compares with 62,367,557 lb. as of March 31, 1912. The disappointment in regard to export figures was due to the fact that custom house clearances aggregated something like 94,000,000 lb., and it was rather expected that not more than 10,000,000 lb. out of this total would show as February deliveries. This figure was evidently, however, nearer 20,000,000. Inasmuch, however, as the grand total of deliveries for the month broke all previous records, it is to be expected that the metal market will stiffen up just as much as general conditions will warrant. The principal selling agencies are quoting 15⅝c. per pound, and are naturally talking higher prices. At the regular meeting of the Copper Producers' Association, F. J. Parker was elected as assistant secretary and treasurer. The annual report of the Rio Tinto has just been received. The figures are given elsewhere. The report is particularly important on account of its discussion of the copper outlook, on which point it says: "The consumption of copper has increased, although not quite so rapidly as the production engendered by the high prices ruling during the last half of 1912. The world's stocks, however, are considerably reduced below the figures of 18 months ago, and today are low compared with the increased turnover, and the future outlook in regard to the price of copper is not unsatisfactory."

It is understood that the hostilities round about Cananea, Mexico, which were so active two or three weeks ago as to enforce the shutting down of the Greene-Cananea property, are considerably less active and that the railroads will be once more operating within a few days. The annual meeting of the stockholders of the Shattuck-Arizona Copper Co. has been postponed, to be held May 5. The new management of the Tennessee Copper Co. is evidently expecting to add no little impetus to the company's operations. James Phillips, Jr., the new president of the company, is predicting a year of great prosperity, and increased production in both copper and sulphuric acid. In a letter accompanying the annual report he sets forth the possibility of Tennessee adding another important product to its output. The letter says in part: "Our engineers have made demonstrations which indicate that it will be possible to work the Eureka orebody profitably. This will have early attention with a view to developing the commercial possibility of producing low phosphorous pig iron as well as copper and sulphuric acid from the Eureka deposit." The annual report shows that during the year there was mined 443,038 tons of ore, and there was smelted 444,284 tons; copper production was 13,252,634 lb. Operating costs per ton of ore were $3.2797. Copper costs were 11c. per pound.

BLACK HILLS, SOUTH DAKOTA

HOMESTAKE DROPS CAGE, BUT RAISES DIVIDEND.—BISMARCK AND WASP NO. 2 RESUME.—GOLDEN SUMMIT BEING EXAMINED.

A cage loaded with four one-ton cars of ore fell from about the 300-ft. level to the 1850-ft. level, at the Ellison shaft of the Homestake, resulting in demolishing the cage, damaging the cable, which followed the cage down and was cut up for removal, and necessitating the suspension of ore-hoisting at the shaft for three weeks. The failure of a clutch is given as the cause of the accident, which occurred while a cageload of ore was being hoisted from the 1100-ft. level to the surface. It started to drop at about the 300-ft. level, as explained, and at the 1700-ft. level crashed through a bulkhead of 12 by 12-in. timbers. It was prevented going into a deep sump by a similar bulkhead at the bottom. The cable, which is ¾ by 7-in. flat rope, was dragged into the shaft, and the entire 2500 ft. piled on top of the cage. It was sawed into short lengths for convenience in removing. In pulling loose from the reel, some damage was caused to the reel, which was repaired by one of the new methods of welding. There was no one hurt; the engineer stayed at his post, but had narrow escapes from flying pieces of steel. Although the Ellison is the principal ore-hoisting shaft of the company, the mills were operated full time without interruption, as the other shafts were called upon to increase their output. Local stockholders were gratified, a few days ago, to receive a stock dividend of 15% on their holdings in Homestake. The local people owning stock, almost all of whom reside at Lead and Deadwood, have practically $1,500,000 worth, and they think so much of it that it is rarely offered for sale. The local people are consistent buyers, and only sell when forced to raise money quickly.

Purchases of gold bullion at the United States assay office at Deadwood were $1,748,000 during the quarter ended March 31, according to L. P. Jenkins, assayer in charge. Considering the severe weather, and the fact that some of the producers suspended altogether for a time, this figure is encouraging. The Bismarck mill, at Flatiron, which was finished early in January, has been put in commission since the weather moderated, and has been operating smoothly and satisfactorily. The plant has not as yet been worked to full capacity, 300 tons per day, but it is expected that by April 15 it will be regularly handling that quantity. Some of the lower grade ore is being milled, in order to get it out of the way, and by the time the plant is working in good shape the better grades of rock will be going to it. After a month's suspension on account of cold weather, the Wasp No. 2 resumed April 1, and is operating full force, anticipating a successful summer's campaign. Preparations are being made to start the steam-shovel at stripping, and this will be done just as soon as the frost and moisture leave the ground. Stripping on the north side of the open-cut is now approximating 15 ft. in thickness. A small electric hoist has been installed to haul the two-yard dump-cars away from the shovel.

The Golden Summit property, near Hill City, a mine containing a small shoot of wonderfully rich free gold quartz, is being pumped out for the inspection of New Yorkers who are figuring on purchasing. The shaft is 320 ft. deep, and at that level a splendid showing of ore is being made. The present owners are willing to turn the property over

to anyone with the means to equip and operate it, and allow them to take the purchase price out of the ore in the property. A new hoisting plant, a small mill, and pumps are required. A reduction of taxes, which have been unpaid for a number of years, has been asked by the Spearfish Mining Co. It is represented that if the County Commissioners will grant this petition, the company will take over some adjoining ground and resume work. The original mine is worked out, and the old mill was destroyed by fire some years ago.

JOHANNESBURG, TRANSVAAL

WILL THE RAND OUTPUT INCREASE?—FAR EASTERN, CENTRAL, AND WEST RAND CONDITIONS.

The marked increase in the gold output of the Rand last year has naturally caused the question to be asked as to how long the Rand can continue to show a yearly progressive output. An answer to the question will be found in the manner the Far East Rand will develop. It cannot be expected that a greatly increased output can be obtained from the Central part of the Rand, every inch of which, practically speaking, is now under tribute; it may, on the other hand, be expected to show a decline. From the Germiston area the prospects of an increased output also are not over bright, several outcrop properties are approaching exhaustion, and a somewhat important stretch of deep-level country has not opened up as promising as it might have done, so that the most that can be expected from the Germiston area is that it should remain for many years in a state of *status quo*. In the Far East Rand, however, there is a considerable area still untouched, a fair proportion of which has good mining prospects, while there is more new development in various stages on hand in this area than in the rest of the Rand put together. There is, for instance, the Van Ryn Deep, with over a million tons of 8-dwt. rock developed and a mill of 80 heavy stamps, supplemented by 8 tube-mills rapidly approaching completion. This plant is expected to rival that of the Roodepoort United Main Reef mill, as a duty of 20 tons per stamp is anticipated. The capacity of this plant is estimated at 40,000 tons per month, and in four months' time the Van Ryn Deep is expected to enter the list of producers. There has also seemed a kind of rivalry between the Modder B and the Brakpan mine, but the latter of late has made the pace somewhat too hot for its neighbor and left it behind. It is now reported that the Brakpan has decided to increase its mill to 200 stamps, which will leave the Modder B still farther behind, and place the Brakpan among the first half dozen mines on the Rand. Sooner or later the Modder B must also add considerably to its milling equipment and help in the early increased gold output of the Far East Rand. In a less advanced stage of development comes the Modderfontein Deep, where a promising reef is being opened. Then there are the extensive State Mines, where profitable if less promising results are now being obtained, and the less important Rand Colliery gold property. Then the Springs Mines are close upon the reef and look like adding considerably to the profitable area of the Far East Rand, and the close approach of the Daggafontein shaft to the Kimberley Reef is not without some significance as far as it goes. Tenders are also going in for the new Government areas between Brakpan and Springs, so that if the prospects of idle concerns such as Apex, Benoni, Van Dyk, Cloverfield, Grootviei, Welgedacht, and Klipfontein are disregarded, it is evident that from the Far East part of the Rand a progressive output of gold ought to be obtained for many years, especially if, as seems likely, a fair proportion of the untouched area proves profitable.

If attention be drawn to the West Rand, a fair amount of scope for further expansion will be found, but not to the same extent and promise as its counterpart on the Far East Rand.

Great things are promised and expected this year from the huge Randfontein property, and better results are looked for from the West Rand Consolidated, Princess Estate, Roodepoort United, Main Reef, Bantjes, and Consolidated Langlaagte. There does not seem to be much prospect at present of the Lancaster West, just closed, being reopened, but there are reports that indicate a resumption of work at the French Rand, and with an improving outlook the Vogel Deep mine ought not to be allowed to remain closed. Of virgin ground of promise on the West Rand, there is not an abundant area; most of the idle ground is too broken, or overlain with a huge thickness of dolomite, to induce mining operations, and a good deal of the deep-level area is not over attractive. Still, the West Rand is in a position to give a good account of itself for many years to come, more particularly if the results at Randfontein, West Rand Consolidated, and Roodepoort United come up to expectation. With regard to the prospects of the extension of the gold-bearing beds in the direction of Potchefstroom, an important paper bearing on the subject is on the point of being read before the local Geological Society by E. T. Mellor, of the Government Geological Survey, which is expected to throw light upon the probable whereabouts of the hidden outcrop of the Main Reef series, after leaving Randfontein and the West Rand Estates. If the extension of the Main Reef series can be picked up under conditions that will admit of profitable working, an immense goldfield will be added to the West Rand and possibly of only a trifle less importance than a good deal of the ground in the Far East Rand area, of which so much is expected. Some attention has, of course, in the past been given to this extension of the West Rand, but it cannot be said to have received the attention its importance deserves, or the prospecting operations to have been conducted in a thorough or methodical, scientific manner.

The mining resources of the West Rand cannot be said to have been increased by the operations of the Government Geological Survey. Mr. Mellor has shown by his work among the lower beds that no profitable reefs exist, and that for future gold production no reliance can be placed on the ill-developed and broken reefs occurring in the Lower Witwatersrand division. The Rand gold output should still continue to increase, although the Central and Germiston areas may not improve. The West Rand will continue to improve, but the Far East, more than any other part of the Rand, ought for some years to come to ensure the continuance of a progressive output.

PORCUPINE

THE STRIKE.—HOLLINGER AND DOME RETURNS.—OUTLYING DISTRICTS.—NEW TERRITORY AVAILABLE FOR PROSPECTING.—LABOR LAWS AND DECISIONS.

While the strike conditions throughout the Porcupine district are rapidly becoming normal, there have been several minor clashes between the strikers and the men working in the mines. In several instances, the strikers attacked individual workers, inflicting serious injuries. The miners finally became so incensed that they proceeded to retaliate, and the situation was considered sufficiently serious for the Mayor of Timmins to read the riot act. The superintendent of the provincial police has also detailed several officers to return to Porcupine to keep order, and it is believed that these precautions will have a salutary effect. Development throughout the district continues to be satisfactory, and both the big companies, the Hollinger and the Dome, have made record productions. At the annual meeting of the Hollinger, the report for the past year showed that the company milled $907,304 worth of ore, from which the profits were $600,664, notwithstanding the fact that the output during the strike was considerably curtailed and that the mill did not start running at capacity until some time in July. The company's ore reserves are estimated at 644,500 tons, valued at $11,271,400. The last statement for the four weeks ended February 25 shows profits amounting to $241,600, which is a satisfactory increase over the preceding periods. During that period 9201 tons, having an average value of $27.67, was milled, at a total cost of $6.74. It is expected that this cost will be considerably reduced in the near

future. At the Dome, the production for the month of March constituted a record and the development work from No. 2 shaft has been extremely satisfactory, the cross-cut to the south having opened a large body of ore, the existence of which had not been shown by diamond-drilling. While no definite action has as yet been taken, if the development during the next few months continues to be as satisfactory, the capacity of the mill will undoubtedly be increased to probably double its present output. Development on the smaller properties continues to show encouraging results, and there will undoubtedly be several new mills under construction this year.

In the outlying districts, Kirkland Lake is still the centre of interest. The Foster claims are showing up well under development, although it is believed that the claim-owners throughout this region are rather nervous as to the depth to which the conglomerate will extend and the changes that may be expected when the veins pass through the conglomerate into the Keewatin. There are also one or two other properties of merit, but development to date has not shown any veins which approach in value those on the Foster. The Swastika district has had no new developments, and the two more important operating companies are still to be considered as speculative ventures. The Painkiller Lake area has been coming in for some attention, but so far nothing has been discovered which would lead to the belief that this district is of any great importance. It is hoped that during the coming summer prospecting will be more active and that it may lead to the discovery of new goldfields. With the exception of the Kirkland Lake district, no area of any importance has been discovered since Porcupine was found, and in fact, despite the active prospecting which has been carried on throughout the areas surrounding Porcupine, the boundaries of that district have not been enlarged since the date of the original staking. Other districts, considerably removed from Porcupine, may soon be open to the prospector, and there are fair possibilities of locating new mineral areas. The completion of the Algoma Central & Hudson Bay railroad from Sault Ste. Marie to the town of Hearst on the Transcontinental, has opened a large amount of territory. The railway has a grant of 2,000,000 acres, 1,500,000 acres of which is underlain by the Keewatin series in which the greater part of ore deposits in Ontario have been found. It is probable that during the coming summer the railway company will throw open this area to prospectors. The new Hudson Bay railway from LePas to Fort Churchill will also open a large amount of interesting territory. So far, practically no prospecting has been done throughout this area, as the possible mineral belt commences 100 miles north of LePas in Manitoba, and, heretofore, lack of transportation has prevented the prospectors from going in. During the coming summer, steel will be laid at least 60 miles north of LePas and will open up a large area of Keewatin rocks which appear to run through Patricia and to New Ontario.

In a judgment recently handed down, Judge Kehoe, of Sudbury, quashes two of the convictions against South Porcupine miners who were convicted under the Lemieux act. In the other test case, he confirmed the decision of the magistrate. As the Hollinger company instituted these prosecutions for the purpose of testing the Lemieux act, the decision is most important to labor throughout the Dominion. In December of last year the Hollinger Mining Co. instituted over 300 prosecutions against men whom they alleged went on strike without giving notice. In two of these cases, the defendants, William Holowaska and Peter Cleary, were not employees of the Hollinger company, but were charged with going on the property and inciting men to strike. Holowaska has been released; Peter Cleary's conviction has been confirmed, as there was a difference in the circumstances of this particular case. When the cases came before the magistrate some time ago, Holowaska and Cleary were each fined $500 and costs or three months in jail, and the third man, Croft, was fined $50 and costs or two months in jail. No fines were paid and the three men were committed. As a result of an application, they were paroled and released on ticket-of-leave, after they had served 20 days. Appeals against the convictions were then made, and the result is seen in the decision and the action of Judge Kehoe. Hon. W. H. Hearst has introduced in the local legislature an eight-hour bill applying to underground workers. Provision is made for emergency work and for shift-bosses, pumpmen, and surveyors working longer hours. The eight hours is to be counted from the time of arrival at work till time of leaving, and is not to include lunch time.

MELBOURNE, AUSTRALIA

BROKEN HILL IRON & STEEL WORKS.—PLANS FOR THE WORK.

Particulars are at length available of the proposals of the Broken Hill Proprietary Co. for the establishment of iron and steel manufacturing works at Newcastle, New South Wales. Steel is to be manufactured from the company's own iron ore by the basic open-hearth process. The first section of plant to be erected will be capable of producing 400 tons of finished steel per diem, equal to about 120,000 tons per year. The expectations of the company are to be seen by a consideration of the official statistics of the import of iron and steel into the Commonwealth during the last three years for which figures are available. These have been:

	Tons.
Pig iron	56,000
Plate and sheet:	
Corrugated, galvanized	57,000
Galvanized not corrugated, and corrugated not galvanized	51,000
Plate not galvanized	49,000
Iron and steel scrap	22,000
Wire-iron and steel	77,000
Rails, fishplates, etc.	196,000
Total	508,000

The import duties upon some of the chief lines are as follows: Plates and sheets, corrugated, galvanized, per ton, general tariff 30s., United Kingdom preferential 20s.; plates and sheets corrugated, not galvanized, per ton, general tariff 20s., United Kingdom preferential 10s.; rails, fishplates, etc. (*ad valorem*), general tariff 15%, United Kingdom preferential, 10%. The financial expert mainly consulted by the board of directors has been David Baker of Philadelphia, Pennsylvania, who has assured the company that it can assemble at Newcastle the iron ore, coke, and limestone for pig-iron production at a lower cost per unit of iron produced than is possible for the United States Steel Corporation, the largest and cheapest producer in its country. Mr. Baker foresees a time when, after the rail mill has been placed in operation, a sheet and wire-rod mill, and a wire plant can be erected to advantage. Initially the plant will consist of one 350-ton modern blast-furnace, three 65-ton open-hearth steel furnaces, one blowing mill, and one heavy-rail mill. The ore will come from the company's Iron Knob and Iron Monarch leases, in the Spencer Gulf district, South Australia, where there are many millions of tons estimated to contain from 65 to 70% of metallic iron.

Newcastle, New South Wales, has been chosen as the site for the works on the ground that it is more advantageous to have them near the coal than to have them near the iron. Of the 264 acres held here, 230 are freehold, and the remaining 34 will be held on a 50 years' lease. The State Government has undertaken to open and maintain along the frontage of this area a channel 500 ft. wide with a low-water depth of 25 ft. It is expected that the works will be near completion in about two years' time. The New South Wales Government has already begun its dredging operations. The capital for the venture is to be supplied by the issue of 240,000 $2 shares at $10. The company has, since its inception in 1885, paid nearly $50,000,000 in dividends, and on May 31 last its liquid assets totaled over $3,000,000. G. D. Delprat, the company's general manager, has expressed the opinion that this new departure will be the most profitable branch of the company's operations. An option of the services of Mr. Baker as manager of the new works has been secured.

General Mining News

ALASKA

Cordova

It is reported that a deal has been completed at Seattle by which the Gold Bullion Mining Co. has sold its five claims on Willow creek, in the Little Susitna River district, north of Seward, to L. C. Thompson, of Toronto, for $450,000. The mine has produced well on a small scale, and a large mill will be erected.

Nome

The annual dog-team races at Nome have been taking place. Each year there are three great races: from Nome to Solomon and back, 65 miles; Solomon to Council and back, 100 miles; and Nome to Candle and back, 412 miles.

DOG-TEAM AT NOME, USED FOR PROSPECTING, HAULING FREIGHT AND MAILS, AND RACING.

The first was run in January in 6 hours 1½ minutes; the second in March, in 12 hours 40½ minutes; while the third, or 'All-Alaska Sweepstakes,' for a prize of $5000, was run on April 10, 11, 12, and 13, the actual time being 75 hours 18 minutes. The race was won by Fay Delezene, followed by John Johnson, 'Scotty' Allan, and T. Iliayok, in order.

Valdez

The new power-plant being erected by the Alaska Water, Light & Power Co. is well under way. The building is complete, pipe-line three parts finished, while foundations for machinery have been started. Valdez will soon have a good power-supply, which will help the cheaper development of mines nearby.

ARIZONA

Cochise County

Further rich ore has been found in the Little Rincon mountains near Benson. On the Massoletti, at a depth of 120 ft., the veins assay from $30 to $60 per ton; the owners of the Socorro claim are sacking ore worth over $300 per ton; and $80 to $125 gold ore has been opened in the Golden West claims.

Gila County

The transmission line from the Magma mine to Miami, to connect with the line from Roosevelt, is now being constructed. The Magma Copper Co. has two auto-trucks hauling ore from Florence to Superior. The old Reymert mine, near the Silver King, has been acquired by the Gunn-Thompson interests. The Miami mine and mill now employ 1200 men. At Live Oak No. 1 shaft, an Allis-Chalmers electric hoist is being installed. On No. 6 level of the Superior & Boston, the drift has been driven 200 ft. in ore. A large coarse-crushing plant is being erected by the Inspiration Copper Co. in Webster gulch, near the shaft, and the storage bins will be of 25,000-ton capacity.

Greenlee County

A fire at Clifton on April 7 destroyed property worth $250,000, and several lives were lost.

Maricopa County

(Special Correspondence.)—W. H. Muiser and L. G. Ochennuter, directors of the Coronado Gold Mining Co., have examined their mining properties in the Congress Junction district, and decided to install a 20-stamp mill at once. The new plant is to be equipped with concentrators and a cyanide plant, and from the tonnage on the dump and recent development they are sanguine of success. Mine work was recently resumed with a small force, but the number will be increased. The mine has been under development at intervals for several years.

Wickenburg, April 6.

Yavapai County

(Special Correspondence.)—Development work is being pushed on the Cleopatra company's property at Jerome. An open-cut on the apex of the mountain is reported to have exposed a body of high-grade copper ore 30 ft. wide. Work on the Hull company's ground has opened some good ore-shoots. G. W. Hull is president and manager of both properties. The Haynes Copper Co. is sinking on its property near Jerome. Sixteen men are employed, and Thomas Campbell, the superintendent, expects to reach the 1200-ft. level early next fall. A good deal of water is being encountered, and about 2 ft. per day is being sunk in the shaft. The Cash mine, which is an old producer near Mt. Union, is working again.

Prescott, April 8.

CALIFORNIA

Butte County

A small company has been formed to work the new property opened at Minshew, five miles east of John Adams. An adit is being driven toward the old Emma adit, which formerly yielded rich ore. After several years' idleness, the 20-stamp mill and cyanide plant of the Forbestown Consolidated Mines Co. is again in full operation.

Calaveras County

(Special Correspondence.)—The Utica Mining Co. has installed electric meters in the business houses and residences of its customers in this town, and the result is that the place is considerably darker than formerly. The Lightner mine is closed down, and there doesn't seem to be any hope of that property resuming operations for some time. The Angels mine is working with its usual force. The Morgan mine, now owned by Mrs. William Vanderbilt, is to be opened and extensively prospected. This property is being worked through the Finnigan shaft, near Melones, and is the property over which Fair and Morgan had such trouble. The Waterman Mining Co. is now sinking its fourth hole. The cores are about 5 in. diam. and vary in length from a few inches to several feet.

Angels Camp, April 11.

Eldorado County

Two gravel channels have been opened at H. M. Johnson's claim at Slug Gulch, and prospects are good.

The Big Canyon mine, near Shingle Springs, is being unwatered preparatory to being examined by mining engineers from London. Ten or twelve years ago this property was a steady gold producer. Dodge Burt is in charge.

Inyo County

The Skidoo Mining & Milling Co. is repairing its 29-mile pipe-line, which was severely damaged by the cold weather several weeks ago, necessitating closing down the mine and 20-stamp mill.

NEVADA COUNTY

The North Columbia River Mining Co. has been formed with a capital of $75,000, to operate the old Grizzly Ridge mine near the Delhi mine on Columbia hill, which has not been worked for several years.

PLACER COUNTY

The Grass Ravine mine, in the Ophir district, has been purchased by W. P. Black and W. H. Keeley, who will clean out the shaft and install a hoist. The Guest Extraction Co. has been formed to treat the black sand in the canyons near Forest Hill. The sand will be ground fine and the gold recovered by a new process.

Three shifts are working at the Rueblin, near Last Chance, and the adit is in 600 ft., and it is expected to cut the vein during the present month. The old Potato Flat mine on Forest Hill divide has been staked by three miners. The 3000-ft. adit in the Home Ticket, near Last Chance, has opened the lower channel, and gravel being mined is returning $5 per car.

PLUMAS COUNTY

J. B. Cozzaglio and associates are erecting an arrastre below the lower adit, at the mouth of North Canyon, near Greenville. A 50-ft. cross-cut opened the vein, and a drift has been driven 100 ft. along its course. It is 5 ft. wide, mineralized, and assays up to $100 per ton. The mill will crush the dump of 100 tons for a start.

SHASTA COUNTY

(Special Correspondence.)—The Mammoth Copper Co. has been negotiating for the purchase of land from some of the farmers below Redding. The farms lie in the so-called smoke zone, and their acquisition by the smelting interests would eliminate some of the most militant opponents of the copper operators. It is understood that negotiations have been hampered by the exorbitant prices demanded by the farmers for their holdings. The Hazel Gold Mining Co. disbursed its regular dividend of $9000 on April 1. This makes $36,000 for the year and $900,000 to date. The company operates the Gladstone mine at French Gulch. Further tests are about to be made with the Heslewood process of controlling smelter fume. A small experimental plant has been provided at Heroult by the Noble Electric Steel Co., but leaky furnace walls and other mechanical troubles have seriously handicapped the tests. Several small shipments of highly sulphurous ore from the Iron Mountain mine have been experimented with, and some encouraging results have been obtained. Active preparations are being made for the entertainment of delegates to the Mining Congress, which meets here in the latter part of May. An aviation meet and other features of interest are planned.

Redding, April 14.

SIERRA COUNTY

A large fan is being installed at the Tightner mine, Alleghany. The Tightner M. Co. has paid a dividend of $1000 per share on the 100 shares of the company.

TRINITY COUNTY

The Guggenheim interests have 20 men and three drills working, one at Graves' place, another at the Alta Berta Co.'s ground, and the third at Carrville. A shaft is being sunk at Poverty Flat. The Alta Berta Dredging Co. is operating its dredge steadily. A. Jacobson and associates have 120 acres of placer ground on Eagle creek, a tributary of the New river, and have just finished building a 6-ft. ditch 2½ ft. wide at bottom and of 4000-in. capacity, 1½ miles long. Their ground averages 15c. per cubic yard, and they can sluice for nine months in the year.

TUOLUMNE COUNTY

(Special Correspondence.)—A local company has undertaken to open an ancient river channel under a lava mountain a few miles north of Confidence. Under the direction of T. Demarais, an adit has been driven approximately 800 ft., and it is believed that the channel will be found within 100 ft. Rich gravel was found in the vicinity some time ago, which showed evidence of having once been the bed of a stream, and the success of the present undertaking is not doubted. Eastern men have taken a bond on the King Solomon mine, in the Tuttletown district, and are actively developing the property. The Experimental Mining Co., operating above Columbia, is milling ore, and results are said to be fully up to expectations. The company is unwatering an adjoining claim, which it proposes to develop extensively. The Japanese company holding a bond on the Manly mine, north of Jamestown, will, it is understood, erect a mill on the property. Preparatory to sinking a new shaft, a head-frame has been erected at the Louisiana mine, near Tuolumne, and a compressor is being installed. The property has not been worked for many years. The erection of a 10-stamp mill at the Columbus mine, near Tuolumne, is nearing completion. The property has been developed to a considerable extent by the operating company during the past year. A new company began work at the Carlotta, north of Tuolumne, on April 7. According to the conditions of the bond, 100 ft. of sinking must be done every four months. C. E. Uren, for many years superintendent of the famous Eagle-Shawmut mine, at Jacksonville, has resigned, and removed to Berkeley to reside. He will henceforth act in the capacity of consulting engineer for the company, with headquarters in San Francisco. William F. Copeland is now superintendent of the mine.

Sonora, April 12.

YUBA COUNTY

A new trial has been granted in the suit of the California Mother Lode Mining Co. *v.* E. Page and others, involving the ownership of a rich claim near Browns Valley. In the first trial the verdict was in favor of the defendants.

COLORADO

CLEAR CREEK COUNTY

The Edison method of treating low-grade ores is to be tried at the Waldorf mill at East Argentine, above Georgetown, within 60 days. A great part of the Waldorf property is worked by lessees, who find an increase of gold with depth, the other metals being silver and copper. Hummer & Son, lessees in the Capital mine, are mining rich ore containing copper, iron, and a little lead. Shipments last week totaled 150 tons. When the weather permits, the Bard Creek company will start erecting a 50-ton mill.

OURAY COUNTY

(Special Correspondence.)—During the quarter ended January 31, 1913, the mill of the Wanakah Mining Co. worked 87 days and treated 4105 tons of ore, producing a total of $39,148. Operating expenses were $23,519, construction $3632, and on property account $16,996. Development covered 720 feet.

Ouray, April 9.

During March the Mountain Top adit was extended 332 ft., leaving about 769 ft. to be driven to cut the vein. A good deal of water was met with, which delayed the work. At 1216 ft. in, a 3-ft. vein was cut. On the footwall was a 4-in. vein containing silver 64.8 oz. per ton, gold 0.04 oz., and lead, zinc, and iron. A large lens of high-grade ore was cut on No. 5 level of the Camp Bird mine. It is stated that the Wanakah Mining Co. will build a 100-ton smelter for pyrite ores.

PUEBLO COUNTY

A fire destroyed a large business block in Pueblo, and the total loss is over $300,000.

TELLER COUNTY (CRIPPLE CREEK)

According to H. McGarry, vice-president of the Golden Cycle Mining Co., the output of the mine is to be increased from 6000 to 9000 tons per month.

The Colorado Mining & Development Co. has acquired a lease on the Free Coinage dumps and shafts, the former containing 300,000 tons of ore worth $3 per ton. A mill has been designed embodying all-slime treatment.

The Portland Gold Mining Co. has started working a 10-ton gasoline locomotive at the Victor mill, hauling cars containing mill residue. The engine, which is the largest of its type in Colorado, is of 4-ft. gauge, running on 45-

lb. rails, and will develop 102 hp. at an altitude of 10,000 ft. It is at present working on Battle mountain, which is 10,368 ft. high.

IDAHO

Blaine County

At the Ivanhoe mine, near Hailey, 12 ft. of ore assaying 100 oz. of silver and 60% of lead has been opened. This property is owned by George Westlake, A. O'Neil, and P. Clark, of Hailey.

Bonner County

The Little Joe Mining Co. has been formed, with a capital of $600,000, to acquire and develop the old Imperial mine, on Pend Oreille lake. Former operators drove two adits about 1000 ft., the lower one having a depth of 400 ft. on the dip of the vein. A raise connects the two adits, and ore already opened assays $100 to $500 in silver per ton and 5 to 7% of lead. A 50-ton concentrating mill has been ordered, also a 3-ton auto truck for transport of ore to the railway.

Shoshone County

Diamond-drilling at the National copper mine, near Mullan, has cut good ore below the 1700-ft. level. There are

MAP OF COEUR D'ALENE DISTRICT.

at present about 5000 men employed in the Coeur d'Alene district mines, with an average daily payroll of $16,000. The Guelph group of 5 claims, adjoining the Hercules and Ambergris, is to be opened in May by sinking 150 ft. on the Cyrano vein, and cross-cutting north 100 ft. to cut the main vein.

At the bottom of the 200-ft. shaft at the Sunset mine, a cross-cut has passed through 30 ft. of zinc-lead ore. At the Copper King, near Mullan, in a drift from the adit, which is at a depth of 1700 ft., 2½ ft. of ore carrying 5% copper, 3% lead, and 5 oz. silver per ton is being mined. Faults have made mining somewhat complex, and drilling is to be done. At a depth of 1700 ft. in the National mine, a copper lode 70 ft. wide and about 350 ft. long has been opened.

MICHIGAN

Houghton County

During 1912 the Calumet & Hecla Mining Co. treated 2,806,610 tons of 'rock' which yielded 67,856,429 lb. of copper. The average price received was 16.65c., and cost 9.86c. per pound of copper. Of the tonnage produced, the Conglomerate lode supplied 1,746,960, the Osceola 1,040,600, and Kearsarge 19,050 tons. The regrinding plant treated 481,320 tons of tailing, yielding 2,155,292 lb. of copper. Dividends amounted to $4,200,000, making a total of $120,050,000.

Copper production of the Lake Superior mines in March was as follows: Ahmeek, 1,220,320 lb.; Allouez, 638,450 lb.; Baltic, 1,806,000 lb.; Calumet & Hecla, 5,030,697 lb.; Centennial, 191,310 lb.; Champion, 2,394,000 lb.; Franklin, 326,000 lb.; Isle Royale, 567,852 lb.; Mohawk, 804,000 lb.; Osceola, 1,374,200 lb.; Superior, 256,905 lb.; Tamarack, 592,770 lb.; Tri-Mountain, 942,000 lb.; and Wolverine. 802,000 pounds.

MISSOURI

Phelps County

(Special Correspondence.)—The senior class of the Missouri School of Mines is at present on the annual senior trip to various points in Missouri. One week will be spent in the Joplin district, one week in the Flat River district, and one week in the various metallurgical plants about St. Louis. The class is accompanied by C. R. Forbes, professor of mining; Durward Copeland, professor of metallurgy and ore dressing; G. H. Cox, professor of geology; A. L. McRae, professor of electrical engineering; and H. T. Mann, instructor in metallurgy and ore dressing.

Rolla, April 10.

MONTANA

Chouteau County

Results of assays from the Silver King mine, near Carter, in the east Coeur d'Alene district, show 65 oz. silver, 40% lead, and $3 in gold per ton, samples being taken from a 20-ft. face in the lower level. This property is between the Glen Metals and Iron Mask mines, and is opening the same vein, where at a distance of 700 ft. in the adit, at a depth of 400 ft., this ore was cut.

Silverbow County

(Special Correspondence.)—The electrification of the Butte, Anaconda & Pacific railway, owned by the Anaconda Copper Mining Co., is progressing rapidly, and it is expected that by June 1 the road will be fully equipped for operation. The Anaconda yards are wired, and the work in the East Anaconda yards and on the smelter lines is nearing completion. Two of the electric locomotives which were ordered some time ago from the General Electric Co. have been completed, tested at the works, and found satisfactory. Direct current, at 2400 volts, will be used in operating these locomotives. A high voltage is necessary, because of the heavy loads that will be negotiated and the steep grades on the Butte end of the line. The machinery used in furnishing the power has been installed in the new sub-stations at the Washoe smelter, and the plant is in readiness to furnish power as soon as the locomotives arrive. There is some delay in stringing the wires on a portion of the line, because of changes in a canyon between Butte and Anaconda.

Butte, April 3.

NEVADA

Esmeralda County

The Lucky Boy adit is in 1500 ft., and is progressing at the rate of 15 ft. per day. The adit is 7 by 7 ft. in the clear, and is lighted by electricity, and the air-compressor is motor-driven. It is proposed to drive 6000 ft. to cut the orebodies opened on the 900-ft. level of the Mountain King, and also to drain the country. There are 30 men employed under M. Gallagher, the mine being 5½ miles south of Hawthorne, near Lake Walker.

At Goldfield, the Yellow Tiger property, which adjoins the Goldfield Consolidated on the south, will be reopened, and $35,000 spent in prospecting. The orebody on No. 7 level will be further developed, and the main shaft sunk to 1000-ft. depth. Mr. Bates is superintendent. At the Goldfield Oro, a 60-hp. hoist has been installed, and sinking will be continued to 1000 feet.

Preparations are being made at the Silver Pick mine at Goldfield to sink the main shaft to a depth of 1000 ft. This property adjoins the Combination and Mohawk claims

of the Goldfield Consolidated, and at present a stope is being worked in the Mohawk 100 ft. from the eastern boundary of the Silver Pick. Timber, pumping, and compressing plants are being arranged for.

HUMBOLDT COUNTY

Over 150 men are employed in the Nenzel hill section of Rochester, and six properties are mining ore for shipment. The Crown Reserve Mining Co., of Cobalt, has acquired several claims from the Rochester Extension Mining Co. for $100,000. There are said to be four distinct veins in the property, and work has been started by the new owners.

The first shipment of high-grade gold ore from National for about two years was shipped by the National Mines Co. last week. The ore weighed 500 lb., and is worth from $25 to $70 per pound, and was taken from the shoot recently opened in the Charleston Hill Syndicate's ground. The situation generally at National is encouraging.

LINCOLN COUNTY

The Virginia-Louise shaft at Pioche is down 320 ft., the last 150 ft. being in ore. No. 3 level has been opened, and a total of 300,000 tons of ore has been blocked out. The shaft is to be sunk farther to water-level.

LYON COUNTY

On April 9 an attempt was made to steal the 14 amalgamating-plates of the William Donovan mill, at Silver City, which has not been working for some time.

The Copper Belt Mining & Development Co. has acquired the Baird claims in the Mason Pass district. Surface work has opened a fair quantity of ore, and a good deal has been shipped. Pasadena, California, people are interested. The magnetic concentration process at the Bluestone is making a good recovery. Ore is being hauled from the Burlington-Nevada mine to the Mason Valley smelter.

NYE COUNTY

The quicksilver industry in the Ione district is growing, and F. J. Davis states that at least one new company will install a furnace this year. The Mercury Mining Co. has been shipping about 40 flasks of the metal weekly and makes a fair profit.

The mines at Tonopah produced 10,872 tons of ore, worth $238,487, during the week ended April 12. The Belmont mill treated 13,519 tons in March, yielding 325,333 oz. of bullion, with a net profit of $150,254. On the 900-ft. level of the North Star, a total of 12 ft. of good ore was cut 200 ft. from the shaft. Eight feet of ore was cut on No. 6 level of the Jim Butler.

STOREY COUNTY

The raise from the 2500-ft. level of the Sierra Nevada is still opening good ore, and on April 11 the assays were as follows: South end of raise, 26 in., averaging $185.55; 5 ft. north, 14 in., $207.85; 10 ft. north, 30 in., $176.80; 15 ft. north, 19 in., $71.10; 20 ft. north, 42 in., $36.80; and 22 ft. north, 45 in., $16 per ton.

OREGON

MALHEUR COUNTY

The old district of Eldorado, now called Malheur, according to the *Malheur Mining News*, produced a good deal of placer gold about 50 years ago, but it was not until 1894 that anything of importance was done. The Last Chance mine was opened in that year, and after doing a lot of development, Ransom Bigelow sold his holdings to a Minneapolis company, which named the property the Black Eagle. A 20-stamp mill was erected, and crushed 250,000 tons of ore, which yielded $2.90 net per ton. A few years later, for some reason, the company was dissolved and the mill removed to the Inter-Mountain mine, below the Mormon basin. The Drexel Mining Co. has acquired the Black Eagle group and will now proceed to develop the property. Late in 1912 the old Red, White, & Blue claim was reopened, and at present six 1200-lb. stamps are at work, with nine men. The Clark's Creek Farm Co. will place a dredge on its property, just across the Malheur-Burnt river divide. The Lynn placers are worked every season. J. B. White, in Freezeout gulch, has driven an adit 500 ft. during the past four years, and expects to cut a vein at a depth of 350 ft. About 110 men are employed at Mormon basin, 6 miles northeast of Malheur, at the Humboldt and Rainbow mines. These mines have 10 and 15-stamp mills, respectively; gold in

MAP OF OREGON.

the former being recovered by amalgamation and concentration, and in the latter by amalgamation and cyanidation. The Rainbow is owned by the United States Smelting, Refining & Mining Company.

UTAH

BEAVER COUNTY

During 1912 mining at the Horn Silver Mining Co.'s property covered 1433 ft., costing $21,556. One lead and two zinc stopes were opened, and there is considerable ore available. Total receipts were $137,114, and expenses $120,517. A fair number of properties are being actively developed in this county.

JUAB COUNTY

Construction work has been started on the new Knight mill at Tintic. It will be of 100-ton capacity, to be enlarged to 500 tons if the roasting and leaching process is a success. There are large quantities of low-grade ores in the district awaiting local treatment. The Centennial-Eureka has acquired an option on the King William mine at Tintic, and will develop it through its 1600 and 1200-ft. levels, there being about 800 and 200 ft. to drive, respectively. The annual report of the May Day Mining Co. shows that the production was 2649 tons of lead ore, worth $20,501, and 5500 tons of zinc ore worth $90,113, lessees producing $23,817 of the total value. A dividend of $24,000 was paid, and cash on hand totals $13,370. Since October 1912 shipments have been 825 tons monthly, and reserves of zinc ore are about 10,000 tons.

SUMMIT COUNTY

A Wellman-Seaver-Morgan direct-connected electric hoist of 500 hp., and an electrically-driven air-compressor, are being installed at the Silver King Coalition Mines' Alliance adit, 1800 ft. underground. A chamber 40 ft. wide, 100 ft. long, and over 50 ft. high has been cut out to accommodate it, and it should be ready early in the summer.

WASHINGTON

FERRY COUNTY

(Special Correspondence.)—The annual report of the San Poil Consolidated Co. for the year ended March 31, 1913, shows that the mill produced $73,000, and shipping ore $27,000. The profit was spent in mine development and mill equipment. An option has been taken by T. Roberts, of Sheridan, Wyoming, on the Silver Leaf mine in the Enterprise district. The vein in this property is 23 ft. wide, and carries streaks of rich sulpho-antimonite ore.

Republic, April 11.

SPOKANE COUNTY

A new rock-drill has been devised by P. J. Grove, of Spokane, who has operated machine-drills in the Coeur d'Alene for ten years. The machine, which weighs 125 lb., is being exhibited at the Central Machine Shops, Spokane. It operates without compressed air, but is worked by a 3.5-hp. gasoline engine weighing 140 lb. It is a one-man machine, and with 600 blows per minute can drill 20 to 25 ft. per day in hard rock.

STEVENS COUNTY

(Special Correspondence.)—During March the United Copper Co. shipped 12 carloads of high-grade ore and one of concentrate to the smelter. The International Diamond Drill Contracting Co. has completed two deep holes for the Aurora Mining Co. and is now drilling at the United Copper mine. The Blue Star Mining Co. is opening a vein on the 350-ft. level, and an orebody having been cut on the west contact, it is intended to sink the shaft to 500-ft. depth. The Redwood Copper Co. is about to resume work. A 40-hp. gasoline engine and hoist has been installed at the June-Echo mine, and the shaft will be sunk to the 200-ft. level.

Chewelah, April 11.

CANADA

ONTARIO

The March production of Cobalt was 1886 tons of ore, while the first quarter of 1913 shows shipments of 5084 tons and 1,880,909 oz. of silver. The Nipissing mine produced 337,121 oz. silver worth $224,530 in March, from the treatment of 113 and 6233 tons in the high and low-grade mills, respectively. No. 64 shaft is down 603 ft. and No. 86 is down 140 ft. in slate. At No. 63, a raise from the 145-ft. level opened 2 in. of ore for 40 ft. worth 3000 oz. per ton, while at 60 ft. it is low-grade. The new ore-shoot in the Lawson property of La Rose company has been opened for 40 ft. on the 188-ft. level, and over a width of 6 in. shows some of the richest ore ever seen at Cobalt. In 1912 La Rose Consolidated company produced 2,816,597 oz. of silver at a cost of 25.93c. per ounce. The profit was $1,023,142, and ore reserves contain 2,796,650 oz. of silver. The high-grade ore averaged 1307 oz. per ton.

Hon. W. H. Hearst, Ontario Minister of Lands, Forests, and Mines, has introduced in the Provincial Legislature a bill prohibiting underground labor in mines for more than eight hours per day. The measure is based on the recommendations made by Samuel Price, former Commissioner of Mines, who was appointed to investigate mining conditions in the province. It covers the entire mining industry with the exception of iron mines, and applies to all underground workers except shift-bosses, pumpmen, or persons engaged in surveying or measuring, but it may be suspended in cases of emergency. If it should pass, it will come into effect January 1, 1914, and will affect about 4000 workmen, chiefly in Cobalt and Sudbury district. As the session is drawing to a close, however, it is altogether probable that some convenient excuse will be found for shelving it until the indefinite future.

MEXICO

AGUASCALIENTES

The smelting plant of the American Smelting & Refining Co. at Aguascalientes, which was shut down for two weeks through shortage of coke, has resumed operations. When the Mexican Central line of the National Railways was reopened for through traffic, the first train brought a load of coke from the Chihuahua smelter, where a large supply was on hand. The Velardeña smelter of the American Smelters Securities Co. was also shut down, but received coke from Chihuahua.

CHIHUAHUA

On April 10, rebels commanded by Pancho Villa attacked a passenger train from Minaca, shot one passenger, and made prisoners of others. The express car contained 122 bars of bullion, owned by various mining companies, valued at $180,000, and this was loaded on mules by the robbers. The locomotive was uncoupled, the throttle opened wide, and let go toward Chihuahua, but it was derailed shortly after starting. On April 6, $20,000 in cash and $15,000 in merchandise was stolen from the Conchos River Dam Co. by rebels headed by Maclovio Herrera.

SONORA

The Mines Company of America during 1912 had a gross production of $2,382,993, and mining, treatment, and general expenses totaled $1,778,998, leaving a profit of $603,995. The surplus and reserve at December 31, 1911, was $2,198,982, which added to net profits made a total of $2,779,782. Depreciation was $204,026, and dividends paid $147,487, leaving the surplus at the end of 1912 at $2,428,269. Owing to the Mexican revolution, La Dura mine was shut down for 135 and the Dolores for 60 days, while El Rayo and the Creston-Colorado worked without interruption. Generally the mines are in good condition, but the ore reserves are less than the previous year. A dividend of 1¼% will be paid on April 25, 1913. The Greene-Cananea Copper Co.'s mines produced in March 4,772,000 lb. of copper, 124,658 oz. of silver, and 686 oz. of gold.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

R. S. McCAFFREY is in New York.

RALPH STOKES is in San Francisco.

R. B. McGINNIS has gone to Oregon.

C. S. HALEY has returned to the city.

E. H. BENJAMIN is visiting New York.

ROBERT McSHAW is at Contact, Nevada.

C. C. BROADWATER is going to New York.

F. L. GARAISON has returned to Philadelphia.

W. W. MEIN will be in San Francisco next week.

W. A. PRICHARD was in San Francisco this week.

H. C. HOOVER sailed from London to New York April 12.

E. H. NUTTER was in New York and has returned to San Francisco.

J. F. CALLBREATH, JR., has been suffering from ptomaine poisoning.

L. N. HAGGIN and C. V. DAEW are visiting the Cerro de Pasco mines.

J. E. CLENNELL has come up from Mexico and will live at Oakland, California.

F. A. BLAKESLEE, of Kansas City, Missouri, will be away from the United States for about a year.

CLEMENT DIXON has been appointed consulting engineer to the Susanna Mines Limited, at Rhodesia.

WALLACE MACGREGOR is general manager for the Globe Con. M. Co., at Dedrick, Trinity county, California.

N. B. ROPER has sailed for Casapaica, Peru, to install a copper converting plant for the Backus & Johnson company.

Stanford University students and former students in geology and mining held a reunion at the University last night.

L. D. RICKETTS is expected to make his headquarters in New York from now on, but for the next year will find it necessary to spend much time in Arizona.

C. E. UREN has resigned as superintendent at the Eagle-Shawmut mine to resume consulting practice in San Francisco. He was succeeded by W. F. COPELAND.

A. H. CASE has resigned his position as manager for the Tennessee Copper Co., and has accepted the position of consulting engineer for Lewisohn Brothers, New York.

RONEAT SCOTT has returned to San Jose, California, from Beatty, Nevada, where he has erected a quicksilver furnace for the Telluride Quicksilver Mining Co., Ltd., controlled by Los Angeles people.

ERIE V. DAVELER, who has been assistant superintendent of the Ray Copper Co.'s concentrator at Hayden, has resigned to accept a position with the Alaska-Gastineau Gold Mining Co., at Juneau, Alaska.

Market Reports

LOCAL METAL PRICES

San Francisco, April 17.

Antimony	12—12¾c	Quicksilver (flask)	41
Electrolytic Copper	16½—16¾c	Tin	52—53¼c
Pig Lead	4.60—5.55c	Spelter	8—8¼c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES

(By wire from New York.)

NEW YORK, April 17.—Copper is very firm. Producers are almost sold out till June. Lead remains unchanged. Spelter is weak, selling pressure being due to small demand. Average daily prices for the past week in cents per pound, based on wholesale transactions, standard brands, are given below.

Date.	Silver, per oz.	Electrolytic Copper.	Lead.	Spelter. St. Louis

Metal Statistics

TIN DELIVERIES, according to L. Vogelstein & Co., during March, in the United States were 5900 tons, which is a new high record, caused by the great activity of the tin-plate mills, while general consumption was also good. Deliveries for the first quarter of 1913 were 1000 tons above the high tonnage for that period of 1911. Straits shipments are cabled at 4800 tons. Metal brokers in London estimate that the visible supply will decrease from 600 to 1000 tons during the month, which is unusual for a Banca sale month; and April shipments will also be small, producing a low-record visible supply. Generally speaking, there seems to be everything in favor of higher prices for tin.

TIN PRODUCTION of the Federated Malay States, which include Perak, Selangor, Negri Sembilan, and Pahang, during 1912, was as follows, as published by *In Tinland*, weights being in piculs of 133.3 lb. each:

January	67,566.26	August	74,831.46
February	72,544.83	September	66,132.00
March	53,698.25	October	65,604.63
April	67,269.81	November	69,086.93
May	71,849.10	December	760,747.01
June	59,465.09		
July	71,175.26	Total	742,223.62

Exports of tin from Singapore and Penang from 1906 to 1911, inclusive, were 58,478, 55,690, 62,744, 60,649, 56,694, and 67,087 tons respectively.

L. VOGELSTEIN & Co. report the following figures of German consumption of foreign copper for the months of January and February, 1913:

	Tons.
Imports	32,395
Exports	1,520
Total	30,875

Consumption during the same period of 1912 was 32,072 tons. Of the above quantity, 26,995 tons was imported from the United States.

Company Reports

HOLLINGER GOLD MINES, LTD.

This company's annual report is the first to deal with actual production from the new mill, and is generally entirely satisfactory. The general manager, P. A. Robbins, reports that the total advance of underground work was 5201 ft., making a total of 8918 ft. Ore reserves are estimated as 644,540 tons containing $11,271,400, of which $6,026,100 is in No. 1 and $2,648,250 in No. 2 vein, the balance being in 21 other veins. Ore has been proved to a depth of 300 ft., but no ore has been included in reserves 50 ft. below the deepest working on any vein. There are 34 known veins upon which no work has been done, other than sampling the surface outcrops. From November 15, to the end of 1912, the mine was at a standstill owing to labor troubles, which cost the company about $100,000. No. 3 winze is being sunk to the 400-ft. level, and the main shaft will be raised from the 300 to the 200-ft. level, and then sunk to 400 ft. Costs have increased during the year, and the February 1913 charges may be set down at $5.97 per ton. Results of the past year are as follows:

Ore treated from mine and dumps, tons	45,195
Contents of ore	$970,305
Recovery	933,681
Net profits	600,664
Dividends	270,000
Carried forward	351,802

EXPLORATION COMPANY, LTD.

This company was registered in 1904 with a capital of $3,600,000, to acquire the assets of a company bearing a similar name formed in 1896. The company carries on a general financial business, and holds interests in real estate and buildings in South Africa, South African gold mines, shares in copper mining companies, the Tomboy Gold Mines Co., Ltd., El Oro Mining & Railway Co., Ltd., the Suchi Timber Co., Ltd., the Buena Tierra Mining Co., Ltd., and in the Exploration Company of England & Mexico, Ltd., sundry investments in the balance sheet being given as worth $2,410,000. Owing to political trouble in Mexico, the Chihuahua smelter, which deals with ore from the Buena Tierra company, was only worked intermittently, consequently the mine production was curtailed, at the same time the first dividend, of 24c. per share, was paid. Metallurgical difficulties upset predictions concerning the profits from the Santa Rosa mine. Both the El Oro and Tomboy mines have shown marked improvement during 1912. Freehold property in Cornhill, London, is worth $720,000. Gross profits for the year totaled $386,880, and general expenses, directors' fees, and sundry investigations cost $114,240, leaving a balance of $272,640. A dividend of 7½%, amounting to $180,000, was paid, and, adding the amount carried forward from 1911, there remains a balance of $92,640.

The chairman of the company, R. T. Bayliss, said in part, with regard to the mining industry generally, "there seems today a lack of activity in the search for new mines and new mining districts. There is nothing in sight, so far as my information goes, that indicates the development of a new field. It is for companies such as our own, therefore, to go afield and look for things; and as Mexico is unsettled, we contemplate examining another country, believed to be rich in minerals, but which up to the present time has received but little attention."

CALUMET & HECLA MINING COMPANY

This company's properties are situated in Houghton county, Michigan, and the capital is $2,500,000 in $25 shares, now quoted at $465. During the year ended December 31, 1912, several other properties were acquired. Work on the Conglomerate lode covered 11,185 ft. of driving, shaft-sinking, and cross-cutting, and the production was 1,746,960 tons of 'rock' yielding 5,193,245 lb. of copper, at a cost of 8.87c. per pound. Development on the Osceola lode covered 18,505 ft., yielding 1,040,600 tons containing 15,692,199 lb. of copper, at a cost of 10.36c. per pound. There was practically no change in character of the ore opened, and fully 25% of the ore came from the foot-wall stopes. Stoping operations are being conducted over the entire length of the lode, about 2⅓ miles. On the Kearsarge lode, work covered 2140 ft., producing 19,050 tons of rock containing 228,985 lb. of copper. The shaft is 500 ft. deep, and driving on No. 2, 3, and 4 levels, while showing some good ore, has not developed ground of commercial value. Diamond-drilling has given no definite information regarding the Mayflower lode, but showed a large area of trap rock and amygdaloid beds carrying copper.

The regrinding mill crushed 481,320 tons of old tailing, yielding 2,155,292 lb. of copper, at a cost, exclusive of smelting and selling, of 4.99c. per pound.

The year's work may be summarized as follows:

'Rock' stamped, tons	2,806,610
Copper production, pounds	67,856,429
Mine cost per ton of 'rock,' excluding construction	$1.91
Average price received for copper, per lb., cents.	16.65
Total cost per pound copper produced, cents	9.86
Dividends received from other companies	$ 892,775
Dividends paid	4,200,000
To date	120,050,000
Cash at mine and New York	150,584
Ore and mineral	6,667,509
Supplies on hand	1,329,810
Bills receivable	953,212
Sinking fund	1,166,999
Liabilities	844,012
Surplus	10,716,414

UTAH CONSOLIDATED MINING COMPANY.

This company has a capital of $1,500,000, and works the Highland Boy mine in Bingham canyon, besides having an interest in the International Smelting & Refining Co., at Tooele, Utah. During the year ended December 31, 1912, mining and development covered 12,320 ft., and 664 ft. by diamond-drilling. On No. 8 level, no ore was found on driving west in Highland Boy limestone, and drilling in four places disclosed the same silicious and black limestone. Several payable shoots were opened on No. 11 level, besides 50,000 to 60,000 tons of low-grade ore, which cannot be profitably worked at present. A 480-ft. drill-hole cut no further ore. Connections for ventilation on No. 12 level will enable ore opened on No. 11 to be prospected. Practically all the lead ore estimated was found in the Yampa limestone, which overlies and is separated from the Highland Boy limestone by a bed of quartzite. The limits of the ore-bearing limestone have apparently been reached. The strike affected operations for 21 days in September and October, and to the end of the year. Ore reserves are as follows:

Copper ore, tons	251,500
Contents:	
Copper, per cent	1.90
Gold, ounces	0.04
Silver, ounces	0.58
Lead ore, first class, tons	24,100
Contents:	
Lead, per cent	14.96
Copper, per cent	0.97
Gold, ounces	0.05
Silver, ounces	3.51
Lead ore, second class, tons	12,000
Contents:	
Lead, per cent	6.80
Copper, per cent	1.10
Gold, ounces	0.03
Silver, ounces	0.35

The second-class lead ore will require concentration.

The year's production was 6,506,814 lb. copper, 8,734,398 lb. lead, 230,004 oz. silver, and 14,042 oz. gold from 159,143 tons of copper ore, and 23,713 tons of first-class lead ore. The revenue from metals sold was $1,976,454, and net profit $603,923, of which $450,000 was paid in dividends. Stocks of copper bullion on hand are worth $401,430, and cash $22,918.

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

STEAM consumed by fuel-oil pumps and atomizers, at the Copper Queen power-plant at Bisbee, takes 4% of the total generated.

EACH reverberatory-furnace at the Calumet & Arizona smelter will supply heat to two 712-hp. Stirling boilers, making a total of eight boilers.

DEVELOPMENT of the Copper Queen orebodies ahead of actual mining has resulted in a reduction of timber used in stoping from 16.6 ft. to 14.9 feet.

RECOVERY of gold at the North Star mines, California, is 77.45% by amalgamation and 22.55% by cyanidation, the actual total extraction being 97.5 per cent.

THREE OXIDES, lime, alumina, and silica, three of the commonest components of all igneous rocks, are the three chief ingredients of artificial building stone (portland cement).

DOGMOBILE is a term given to the dog-teams and trucks which are used on the narrow-gauge railway, 90 miles long, between Nome and Lane's landing on the Kougarok river, Alaska.

THE NUMBER of claims which may be entered by one person under the lode law is unlimited, provided he does the necessary assessment work and otherwise complies with the law for each claim.

WILFLEY TABLES are being tried in the washery of the Stag Cañon mine, New Mexico, and results prove conclusively that a profitable tonnage can be recovered from the washery refuse products, and even from the waste dump.

POWER-STATIONS on the Rand, at the end of 1912, had a capacity of 94,000 kw. electric plant, and 40,500 kw. air-compressing plant; while it is estimated at the end of March 1914 there will be available 140,000 kw. and 61,500 kw. respectively.

PEAT from certain districts of Ontario shows the following analyses: 61 to 71% volatile matter, 18 to 27% fixed carbon, 4 to 20% ash, nil to 2.7% phosphorus, nil to 1.3 sulphur, and nil to 1.9 nitrogen, the calorific value being from 7490 to 9102 B. t. u. per pound.

FORMULA for calculating the horse-power of spiral conveyors is as follows:

$$\text{Hp.} = C\ W\ L \div 33{,}000$$

When C = constant 0.33 for grain, 0.65 for coal, and 1.0 for heavier and sticky materials; W = weight of material conveyed in pounds per hour; and L = length of conveyor in feet.

MORTAR, according to A. Gaylor and T. Sanborn, containing oil up to 25% by weight of the cement, shows (1) slightly less absorption of water than plain mortar, the absorption decreasing with the quantity of oil; (2) the tensile strength is decreased considerably below that of plain mortar, the strength decreasing with the increase in the quantity of oil; while (3) oil-mixed concrete containing 5, 10, or 15% of oil, by weight of cement, is more permeable under pressures from 20 to 60 lb. per square inch than concrete without the incorporated oil; and oil-mixed mortar containing 10% of oil is more permeable than plain mortar, under pressures of 10 and 20 lb. per square inch.

CAISSON DISEASE is an ailment caused by men working in compressed air in certain mining work where it is necessary to keep back water and sand. On the Colorado river siphon, constructed by the United States Reclamation Service at Yuma, 20 seasoned men from the Eastern states remained throughout the job, but the remainder, mostly Mexicans and 'floaters' were constantly leaving. At 30-lb. air pressure, only 4 hours was worked on a shift and there were no fatal cases. The time of 'locking out,' that is, moving from the air-lock to ordinary atmospheric pressure, was fixed at 12 to 15 minutes, the rate of decompression being made constant. About 1300 men were employed in compressed-air work from start to finish; and the records show 299 cases of disability for a few hours, 38 cases of disability from one to three days, 4 cases of part paralysis, and 1 case of total paralysis, resulting in death in three weeks.

REPAIRING broken gear, spindles, or rabbles in an Edward's duplex roasting furnace does not necessitate stopping the furnace for more than a few minutes, unless the break-down is near the middle fireboxes or in either row of rabbles opposite. The job is done as follows: The furnace is stopped and the key driven out of the pinion driving the respective broken parts, and the pinion is knocked out of the way. When the machine is started again, care must be taken to see that the rabble to be repaired is clear of the sweep of others. There being two rows of rabbles, those which are working on one side will carry the ore to the opposite side, which then carry it past the break. The repairs may be made at leisure, without materially interfering with the good work of the furnace. It is advisable to have spindles ready with the crown wheels attached, and if in a hurry, two men with a light tackle can make repairs in an hour. When all is in place, the furnace is stopped, the pinion moved in gear, keyed up, and re-started slowly. The spindles are purposely made the weakest part, as a rabble is more costly and takes longer to change if broken. Clinkers form occasionally near the fireboxes, and this should be attended to regularly.

PRESERVATION of merchandise in the tropics calls for great care in regard to dampness. The following notes are from a *Daily Consular Report* from India: The effect of heavy and continuous rain in the tropics is to produce a dampness in the air quite unknown in Europe and America, and which is destructive to many articles from these countries. The moisture and heat combined, set up all kinds of fungoid growth and decay in goods, which are quite unaffected by the climatic conditions of Europe and America. Mildew attacks textile goods, leather, books, and stationery; and arms, cutlery, and metal work require constant supervision to preserve them. Furniture of wood is soon spoiled by swelling and shrinkage, or by borer worms; and liquors, excepting the strong alcoholic ones, rapidly deteriorate in the heat of India. Perishable goods soldered up in tin-lined cases are not safe, if they have been packed in wet weather. The heat of the ship's hold in the Red Sea, or that of a closed iron wagon on the Indian railways, when the iron may acquire a temperature of 160° in the sun, will start mildew in the case by the aid of the moisture within it. Straw and shaving packings hold a good deal of moisture in damp weather, and do much mischief when sent to the tropics. No merchandise, therefore, that is liable to injury from heat or moisture can be stored long in India without serious deterioration. Books, if bound with ordinary paste, are quickly attacked by mildew and by vermin. The paste should be mixed with corrosive sublimate, or other antiseptic. Beetles will eat off the surface finish from stamped cloth covers. Books on shelves, unless packed tight, are all hanging by the binding, and a warm, damp atmosphere loosens them from the covers if they are large. All large books for use in the tropics should be bound so that when placed upright on a shelf the leaves should rest on the shelf—that is to say, the covers should be cut flush with the leaves on the under side. The appearance of such a volume might provoke criticism, but it would never lose its cover in the manner described. Books sewed with wire go speedily to pieces in the tropics. Since wire sewing has been introduced, a foolish economy has substituted tinned iron wire for tinned copper. The tinning soon disappears from the iron and the book falls to pieces.

Decisions Relating to Mining

Specially reported for the MINING AND SCIENTIFIC PRESS.

RETURN OF PURCHASE MONEY

Where a placer claim was entered for patent and the entry was subsequently canceled by reason of an adverse report by a forest officer charging that the land was more valuable for the timber thereon and for townsite purposes than as a mineral claim, upon a finding that no fraud or attempted fraud was committed in securing the entry, upon its cancelation the claimant is entitled to a return of his purchase money.

Alfred D. Hawk, 41 Land Decisions, 350. Oct. 30, 1912.

OIL AND GAS LEASE—RENTALS

An oil and gas lease, after providing for forfeiture if a well was not drilled within one year, gave the lessee an option to keep the lease alive after that period by paying an annual rental of 25 cents per acre until a well should be drilled. Held, that the lessor could not, by keeping the lease open voluntarily, collect such rentals from the lessee by suit.

Deming Investment Co. *v.* Lanham (Oklahoma), 130 Pacific, 260. Jan. 7, 1913.

COAL ENTRY—QUALIFICATIONS

The fact that a coal entry by an individual was made for the benefit of a corporation does not affect the validity of the entry, provided the corporation and each of the persons in whose interest the entry was directly or indirectly made possesses the requisite qualifications to make entry under the coal land laws. A second coal filing by the same person may properly be allowed where sufficient reason is shown for failure to perfect title to the tract embraced in the first filing.

Anderson Coal Co., 41 Land Decisions, 337. Oct. 21, 1912.

EXCESSIVE LOCATIONS—MARKING BOUNDARIES

Where a magnesite lode claim was located in a bushy gulch, and on account of the roughness of the country and lack of proper instruments for measurement, the locator was compelled to 'step off' his lines, marking by this method a location with side lines 2000 and 1700 ft. in length respectively and one end-line more than 800 ft. long, the court held that the claim was not void because of excess ground included, but only because it was found to be insufficiently marked. Had the boundaries been properly marked, the locator would have been allowed to cast off the excess area unintentionally included, and the claim would have been valid except as to such excess.

Madeira *v.* Sonoma Magnesite Co. (California), 130 Pacific, 175. Dec. 27, 1912.

ROCK PHOSPHATE—LOCATABLE AS A LODE

Calcium as rock phosphate, occurring in horizontal or 'blanket' veins of various degrees of thickness, when found in place firmly fixed in the mass of mountain between defined strata of limestone, is properly located under the lode laws and not as a placer claim. Where the rock was formerly located and held as placers and an adverse locator enters peaceably on the ground covered by the placer locations and makes lode locations thereon, the lode claimant may successfully adverse the placer locator's application for patent. In determining the possessory rights of the adverse claimants, a court of law may pass on the question as to whether the ground is properly locatable as lodes or placers, such determination being necessary to a proper decision of the issues, and not being a question exclusively within the jurisdiction of the Land Department.

San Francisco Chemical Co. *v.* Duffield (Wyoming), 201 Federal, 830. Nov. 21, 1912.

[This decision, in effect, if not directly, overrules the decision of Judge Van Fleet reported in our issue of November 16, 1912.—EDITOR.]

Points on Mining Law

FIXTURES AND PERSONAL PROPERTY

A track laid in a mining tunnel in a more or less permanent manner is a fixture and passes with the real property, regardless of change of ownership, unless some special provision in the lease gave the lessee a right to remove improvements upon abandoning his lease. In such event he would have to remove it within a reasonable time. The car is personal property and may be recovered by its owner at any time prior to the elapse of the three-year period of limitations.

POLL TAX IN CALIFORNIA

The state poll tax of $2 is payable by all male inhabitants of this state between the ages of 21 and 60 years. Road poll taxes not exceeding $3 per year in amount may be levied by the Board of Supervisors of any county on all male persons over 21 and under 55 years of age. There seems to be no specific authorization in the Political Code for the levy of a hospital poll tax, although section 3816 provides for the accounting by the county officials for hospital poll taxes collected. The assessor may collect the poll tax from any person indebted to another person who has not paid his poll tax, and the assessor's receipt is to that extent a discharge of the debt. It is the usual custom to collect poll taxes from employers for all their employees, and the amount for which he is liable is deducted from each man's wages.

TUNNEL RIGHTS

Many questions regarding tunnel rights have never been answered in the courts. Six months is the statutory period within which one should commence work on a tunnel location, and work must be prosecuted with reasonable diligence in order to protect rights thereunder. The claim extends for 3000 ft. from the 'face,' which is the point of inception. Presumably ground for dumpage purposes could be obtained by a surface location at the 'face.' No surface rights are conferred by a tunnel location in itself. The tunnel locator is merely given the right to veins or lodes not previously known to exist which he discovers in his tunnel. If he desires surface rights in connection with such lodes, he must make surface locations upon their discovery, and this is the usual custom. The assessment work for all claims located over the tunnel may be done in the tunnel, under one claim, if it is for the benefit and development of all of them.

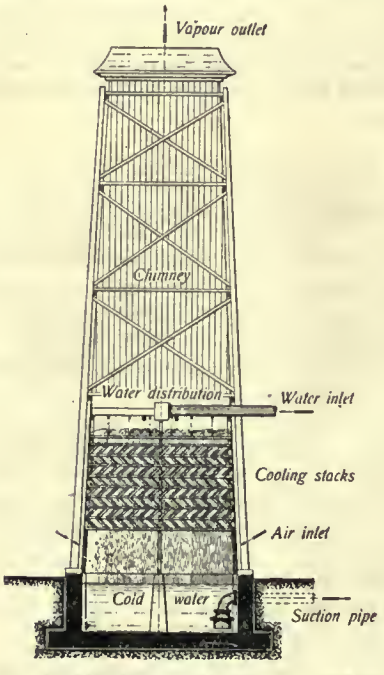
The Wheeler-Balcke Tower

The substantial economies and advantages of the steam turbine, and especially the low-pressure steam turbine, have been demonstrated by repeated experiences. The low-pressure turbine can almost double plant capacity without the addition of boilers, stacks, fuel, or labor. But the condensing water necessary is scarce in the case of many central stations, electric railway plants, and especially factories, mills, and industrial plants. In such situations the use of apparatus for recooling the condensing water permits of operating condensing with or without low-pressure turbines. A cooling tower is the device most often used because of its greater efficiency as compared to spray nozzles or ponds and its simplicity and compactness. A properly designed water-cooling tower thus becomes equivalent to a natural water-supply. If it operates with natural draft and no fan is used, the only item of operating expense is the cost of lifting the water to the distributing system, and this lift may be greatly reduced by proper design of the cooling stacks over which the water falls.

The primary essentials for effective cooling are large capacity for dissipating heat to the atmosphere, so that a large volume of water is cooled, and the ability to dissipate this heat at a low temperature so that the water is cooled to a low temperature. To accomplish this, the water must present an extensive cooling surface to the air rising within the tower, and, secondly, there must be a brisk and vigorous air circulation. The Wheeler-Balcke tower is designed to meet these essentials by arranging the cooling stacks in zigzag tiers, which, while retarding the downward flow of the water, present but little resistance to the upward flow of the air. The cooling laths retard the downward flow of the water and spread it out into thin films, collect it, and break it up into drops, so that an extensive and ever-changing water-cooling surface is presented to the air. This method of cooling is known as the 'drop and film' principle. The tower is shown in the accompanying figure and is described by the manufacturers, the Wheeler Condenser & Engineering Co., of Carteret, New Jersey, as follows: Starting at the top, there is first the vapor outlet, beneath that the chimney, next the water-distributing system, which receives the water to be cooled from the water-inlet pipe and discharges it evenly over the whole surface of the tower. Beneath the water-distributing system are the cooling stacks and the air inlets, and finally, at the lowest point, the cold-water well, in which the water is collected and from which it is drawn to the condenser. The chimney and vapor outlet are of cypress boards, supported by a framework of yellow pine, resting directly upon the foundation. The chimney is of sufficient height to prevent loss of water by spray, and to draw a strong natural draft and a vigorous flow of air through the cooling-stacks. The timbers forming the frame of the tower and chimney are especially treated to prevent deterioration. The frame is constructed with mortised and tenoned joints where necessary, bolted together with steel bolts with large iron washers on each side, thus making a rigid and substantial frame to withstand a fifty-mile wind pressure. The shell of the chimney and the tower consists of surfaced tongued and grooved 1-in. cypress boards as free as possible from large loose and dead knots, shakes, and other imperfections, treated after erection with a special wood preservative to prevent decay. Special attention is drawn to the water-distributing system. The main trough into which the water is discharged from the water inlet is of cypress planks 1½ in. thick; from which the water flows into lateral gutters, which in turn distribute the water over the entire area of the tower by iron pipes arranged at equal intervals in the length of the gutters. The water falling from these pipes impinges upon galvanized-steel splash plates, which break the water into a fine spray, presenting to the rising current of air a cooling surface of maximum area. The water then drops upon the triangular cooling-laths below, which are arranged in zigzag tiers, as shown. The water is continually broken up, turned over, spread out in a thin film and retarded in its downward progress, so that the greatest possible amount of surface is exposed to the rising current of air. The zigzag arrangement of cooling-laths insures thorough breaking up and turning over of the water.



THE WHEELER-BALCKE COOLING TOWER.

The cooling material or cooling laths are supported by a framework independent of the tower and chimney, and consist of well selected cypress. Cypress being practically indestructible in water, the life of the tower is almost unlimited. Data regarding the life of cypress wood may readily be obtained from Government publications, which cite, for instance, a case where a well selected grade of swamp cypress lasted in first-class condition for over 80 years. The air enters the tower near its base, louvre boards being used to prevent loss of water by splashing, diverting it instead into the cold-water well. The cold well also forms the foundation for the tower and may be made of concrete or masonry, as desired by the purchaser. A working platform with hand rail is built on one side of the tower. The platform is reached from the ground by means of a strong ladder also provided with hand rail. Entrance is effected into the tower by means of a door which is made part of the shell. The distributer may be cleaned out by a broom while the tower is in service.

Scarcity of Aluminum

There is proof of the scarcity of aluminum in the large number of inquiries being made in various quarters by consumers as to where they can procure prompt deliveries. They do a large amount of shopping, particularly for sheet aluminum, and find great difficulty in satisfying their wants. Apparently production is not keeping pace with consumption. Culinary utensils are taking a large amount of the metal, as well as automobiles. Manufacturers of 'fireless cookers,' lamps, and match plates for molding have been among those seeking the metal, while the foundry business is increasing steadily. A large foundry is being built by the Werra Aluminum Foundry Co. at Waukesha, Wisconsin. News dispatches from Pittsburg, Pennsylvania, state that pressure for deliveries of aluminum sheets on contracts placed a year ago is so severe that the Aluminum Company of America is months behind in orders, and consumers are looking abroad for material. When books are opened for new business it will be for 1915 delivery. Even improvements which will result in increased production have been discounted. Other reports state that contracts incidental to the construction of the big plant of the Southern Aluminum Co. at Whitney, North Carolina, are about to be, or have been, placed, and it may be that some relief will be afforded by the operation of this plant.

TABLE OF CONTENTS

EDITORIAL

REPORTS of the Nevada Consolidated, Ray, and Chino companies were made public this week. As usual, each presents much of public and technical interest. They will be reviewed next week.

SPRING has come and the mines in the Coeur d'Alene are short handed. The men say they leave for the farms—but there are many fine streams in the mountains, and fishing rods weigh less than hoes.

COMPOSITE prices of iron and steel are figured monthly by *The Steel and Metal Digest*. The pig iron price for March was 16.775, a shade under prices for January and February, but materially higher than the March price at any time in five years. The steel price was 1.7646, substantially equal to that of any month since July 1910, and higher than any March price, except that for 1910, in recent years.

ONE of America's best loved minor poets once wrote:

> "*De gustibus*, 'tis stated, *non disputandum est*,
> Which meaneth when translated, that all is for the best."

We commend these lines to those of our readers who may think that the discussion in our pages, started by 'A Miner' and continued first by 'Mine Superintendent' and now by 'A Commissary,' is likely to become acrimonious. If the use of butter-knives makes for peace and contentment, or the reverse, around a mine, the matter is, like Lincoln's rat hole, "worth looking into."

SINTERING fine ore preparatory to smelting is by no means easy, but the difficulties are being gradually overcome, and it is hoped that the necessity for briquetting in all but exceptional cases will ultimately disappear. One of the most successful devices is the Dwight-Lloyd, which operates on the principle of drawing a flame down through a thin layer of fine material carried in movable pallets. This machine quickly made a place for itself in lead smelting and is now finding a field in treating ores of copper as well. With the latter it works excellently when the percentage of sulphur is about 15. A smaller amount results in too little bond, while a larger causes the formation of a crust over the top of the layer of ore. The machine has been adopted by the Tennessee Copper Company, and has just been placed in the plant of the Cerro de Pasco company. Its use at the latter is especially noteworthy because of peculiar problems due to the great alti-

tude at which smelting is conducted and the large amount of study that the engineers of the company have devoted to the problem of handling fine material. We will print later a special article covering these new developments in sintering.

FURTHER details regarding the flotation of Inspiration ores are now available. The new plant of 600 tons capacity is to be rushed to completion, and if it proves the success that is anticipated, a 7500-ton plant will be built. The experimental work, which was under direction of Mr. E. H. Nutter, representing Minerals Separation, Limited, and which was conducted in a 50-ton unit, built by the way in 16 hours, was on ore representing 98 per cent of the ore reserves. The tests indicate a saving of 93 to 94 per cent, the concentrate assaying close to 40 per cent copper. While the extraction cost has not been made public, it was evidently low enough to warrant expectation of material profit even allowing for the royalty that will be paid. Aside from that, it is estimated that the simpler plant will permit a saving of $1,000,000 in first cost of the projected first unit. Adoption of flotation at the Inspiration without waiting for decision of the litigation at Butte, is a great triumph for Minerals Separation. How rapidly methods are developing, despite the fact that the art is still on an empirical basis, is indicated by the circumstance that the Inspiration ore is secondary in origin, and so recently as when Mr. Theodore Hoover published his excellent book on flotation, treatment of secondary copper ores was held to be impossible.

CHILEAN copper mines are attracting serious attention in New York, the Guggenheims leading in the work of development. The Chile Copper Company, with a capital of $95,000,000, was incorporated under the laws of Delaware, April 15. The company was organized in Delaware because the present stringent corporation law in New Jersey does not offer attractions to large corporations. It will take the place of the $20,000,000 Chile Copper Company organized in Maine last December, and will also take over the $1,000,000 Chile Exploration Company. The next step, after incorporation is completed, will be to issue $15,000,000 in 7 per cent convertible bonds, increasing the capital to $110,000,000. The stock will not be offered for public subscription. Mr. Daniel Guggenheim will be president of the new company, and Mr. A. C. Burrage vice-president. Development is already under way, as noted in a recent issue. The Braden company continues to do good work, having milled 53,700 tons of ore, averaging 2.4 per cent copper, in March, yielding 1,472,000 pounds of copper. The recovery in the wet concentration mill was 65 per cent, and in the Minerals Separation plant 71½ per cent. The copper production of the Braden for the first three months of this year amounted to 4,134,000 pounds. Incidentally, converters are being erected at the Backus & Johnston smelter, at Casapalca, and the company will ship blister instead of matte, as it is now doing. The present output is about 700,000 pounds per month.

DECANTATION is a process that attracts much attention just now in view of the situation as regards vacuum-filter patents. In a recent editorial we questioned its general applicability to treatment of slime, and our comment has been widely quoted. In the *South African Mining Journal*, Mr. Huxley St. John Brooks recently discussed the limitations of the process in an informing article, of which we present an abstract on another page. Mr. Brooks considers continuous decantation to be inapplicable to ores when the greater part of the gold or silver is locked up in the sulphides, or to high-grade ores that require extra strong solutions. He would apply the process to low-grade silicious ores requiring solutions of only moderate strength, and even in this case evidently prefers to combine the process with filtration. We have printed several articles, and have others in hand, in which the application of continuous decantation is described. The process has a field, and we hope to do our part in pointing out the conditions under which it attains maximum usefulness; our original protest was against a disposition to hail continuous decantation as a panacea, and the scramble to get away entirely from filtration. In the meantime, the metallurgist who reads Mr. Brooks' article will find in it a number of practical points of great helpfulness.

MEXICAN conditions show no signs of immediate improvement. Advices from the City of Mexico indicate general discouragement, though, as one correspondent writes, no one should expect any government to pacify the country in three months. Local sentiment, among Americans at least, is evidently strongly favorable to the present Government and the American Ambassador, Mr. Henry Lane Wilson. Members of the American colony feel that Mr. Wilson's activity and good judgment preserved the lives of many who would otherwise have been sacrificed at the time of the recent fighting in the city. In the United States the killing of Madero produced a profoundly unfavorable impression, and as one result the Huerta government has, rightly or wrongly, fallen heir to profound distrust. In the meantime the rebellion in Sonora and adjacent states is gaining headway. Point after point has been won by state troops, and the federals are now being besieged at Guaymas. At Cananea the mills and roasting-furnaces are idle, and a mob of 2000 men last Monday compelled the new manager, Mr. James S. Douglas, to leave the district, when he refused to give them work. Conditions are more serious there than at any previous time. Mr. L. D. Ricketts has gone to the scene of trouble, and it is hoped that means of meeting the situation will be found. The officials of the Cananea Consolidated Copper Company can hardly be expected to keep the plant in full operation, in view of the disturbed conditions and the fact that adequate police protection is not available. At the same time, stoppage of work operates to increase largely the number of trouble-makers. Many companies operating in Mexico have, in the past two years, been exhausting ore reserves with no adequate return; but there is nothing Mexico needs more than steady workers.

The Airblast at the Miami

The accident at the Miami mine, of which an account is given in our news pages, calls attention to a source of danger little appreciated by metal miners. Falls of rock are in themselves prolific causes of accidents to men, and great pains are taken and expense incurred to protect workers in this particular. The Miami mine was no exception. Readers who recall the description of the mining method employed, written by Mr. C. F. Tolman and revised by Mr. N. O. Lawton, that we printed November 13, 1909, will remember that elaborate plans had been laid to enable the men to work always under cover. How successful Mr. Lawton's plans were in this particular is evidenced by the fact that despite the fall, over an area roughly 450 by 500 feet, of rock estimated to have weighed 3,000,000 tons, not a man was injured by the rock itself. Even when the cave extended through from the level first affected to the one below, every workman was able to step into a fully protected drift. The men who were killed and injured lost their lives as the incidental results of the great airblast caused. This, in Western mines, is not a frequent source of danger, but it will not do to jump to the conclusion that it is a result of the caving methods of mining now being introduced. Airblasts occurred on the Comstock and have been noted elsewhere. They take place also in narrow workings and are the result of moving ground whether in broad stopes, as at Miami, or extensive narrow ones, as at the Champion Reef mine in the Kolar field of India. It is worth noting that at the latter mine airblasts are becoming more frequent, and a seismological observatory has been erected in the field for their study. Of 88 men who lost their lives in the Mysore gold mines last year, 41 deaths were due to airblasts, and 21 men were killed in one of the 406 noted. Compared with this record, the Miami accident, unfortunate as it was, becomes minor. It may none the less prove extremely significant, and the whole matter demands careful study.

Airblasts are not unknown in the mines of the United States. In the Lake Superior region they are common, but, so far as our recollection goes, have not resulted in loss of life. Their cause is the sudden compressing of air in a confined space, as a result of the infall of a large mass of rock. The wave of compressed air rages through the mine, exactly as does any similar wave caused by a dust or gas explosion in a coal mine. Men, timbers, cars, are picked up and thrown varying distances, according to the force of the blast. At Miami a train of 15 cars and a 7-ton motor was blown 200 feet along the track despite the best efforts of the motorman. Some of the men injured were blown forty feet or more. Such a blast has terrific force, and, if possible, means must be found to avoid their creation.

Recalling Mr. Lawton's method of mining already cited, it will be remembered that the system is one of large rooms and pillars. The rooms are kept filled with broken ore and the men work under cover, retreating into the pillars. It was planned to remove the latter by top slicing. Owing to irregularities in the top of the deposit, it was necessary to square-set a large area in starting the system. The plan is based upon Lake Superior methods, with which region both Mr. Lawton, the superintendent, and Mr. J. Parke Channing, the ruling spirit in the company, are thoroughly familiar. Carrying into a district methods developed in another necessarily involves nice judgment as to modifications. In introducing Lake Superior mining methods into the copper mines of the West, the principal new features are the greater vertical thickness of the orebodies, and greater strength of the walls, the capping, and the ore itself. It is worth noting that on the Mesabi range, where both ore and capping are soft and can easily be induced to cave, room and pillar methods have been almost entirely abandoned in favor of uniform top-slicing. While the ore won in room mining is cheap, there is increased danger, and the loss in pillars has been found to offset the economy. Experience of the same sort, though in reverse, may be cited from coal mining. In the latter long-wall work corresponds closely to the top-slicing by the iron miners, though rarely is it possible in a coal mine to take more than one slice. Long-wall mining has been proved time and again only to be successful when the roof is weak. Where it is strong it holds up until a great area is mined and then, giving way all at once, causes disaster. Any room and pillar method of caving is dependent for success upon bringing the capping down regularly and evenly. The cap must not be allowed to hang up and arch over any wide area. Entirely aside from the difficulties of judgment that this involves, there are certain human problems. The economical success of the method depends upon caving the greatest possible percentage of ore, and with the long time that must elapse between discovery and production, in the case of any of the great porphyry copper mines, there is every inducement to work quickly. It is even difficult to insure that subordinates will follow instructions and draw ore evenly from the stopes, and yet a big empty stope is a constant potential source of danger. Even locking and sealing the chutes, as has been done by one enterprising manager in the Southwest, does not altogether protect the mine.

Speed is the American mania, and we cordially sympathize with the managers who feel they must rush production. But speed involves drawbacks and, at times, penalties. Winning the last ton of ore is none too easy at best, and winning the heart of the deposit cheaply may well involve prohibitive expense later. We are glad to be able to add that the Miami engineers have shown every disposition to provide for the future even at added present expense. The mining expense per ton has heretofore been, if anything, a little higher than was anticipated. The figures for the past two years are given elsewhere. This has been explained, correctly enough, as the result of the careful square-setting over the main workings, undertaken preparatory to regular work. The accident of last week merely indicates that, since despite the care and competence of the engineers of the Miami, an airblast did occur, a grave danger must be faced in all the large mines, and even more care must be taken.

Rand Practice in Deep Shaft-Sinking

By Charles B. Brodigan

*Although the speeial subject upon whieh I propose to address you is shaft-sinking, I think it would add to the value of my paper if I prefaeed it by a short introduetion giving some idea of the nature of the problem that must be solved by the engineer before the work of shaft-sinking can be started. In order that you may be brought into touch with aetualities, I will consider the problem of the Brakpan Mines area as it came up for consideration before work aetually started upon it. The area is shown in Fig. 1. From evidenee afforded by bore-holes sunk upon the Brakpan and adjoining areas, a close approximation to the depth, dip, and general eontour of the reef eould be obtained. Speaking generally, the 3000-ft. contour was as shown in Fig. 1. The dip was estimated to vary

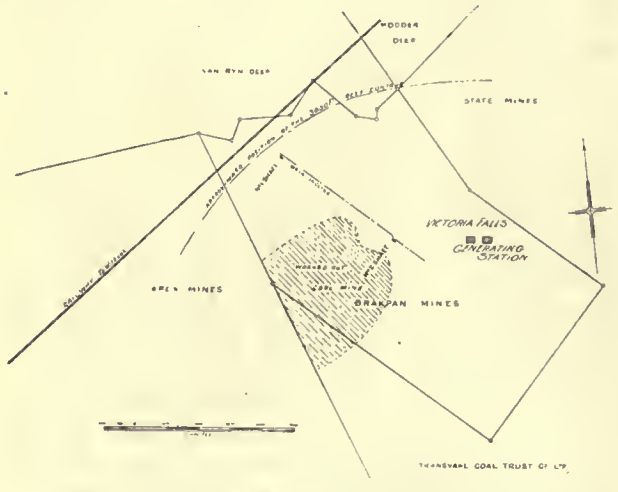

Fig. 1. Plan showing position of shafts.

from a maximum of 20° in the northwest corner to almost nothing about the centre of the area.

With this knowledge it then became a question as to the relative advantages of rise and dip shafts (otherwise described as shafts situated on a dip line) or strike shafts (shafts sunk on a contour line) for opening the area. The issue was at the time complicated by the faet that no long incline connection, in dead ground, had ever been made from lines derived from plumb-bobs swinging at a depth of from 3000 to 4000 ft. It was obvious that in a flat area it would be a great advantage to sink two rise and dip shafts separated by about 4000 ft., and which would eventually be connected by a haulageway for the transport of ore and material to the lower shaft about which the reduction works would be ereeted.

The strike shafts were, however, the easier scheme, for here there was no surveying diffieulty. All that had to be done was to sink the shafts, measure their depth, and then when the reef in both shafts was opened at the same level, simply drive the connection on reef. The strike shaft scheme had, however, the great disadvantage that wherever the shafts were plaeed there would be diffieulties with regard to ventilation and haulage, and also the probability of having to work a great amount of ground above the shafts, that is, to the rise; problems that were mueh simplified by the adoption of the rise and dip scheme. The strike shaft scheme, in faet, imposed such conditions on the ventilation and economieal extraction of the ground that it was eventually decided to brave the diffieulties connected with the aeeurate laying out of the incline connection and proeeed with the rise and dip shaft scheme.

Having once decided upon the general scheme, it was an easy matter to fix upon the positions the shafts should occupy. As the whole of the area would have to be opened up from two shafts, it follows that they should be central as regards the whole area. The existence of a worked-out coal mine, shown as a shaded area on Fig. 1, had to be considered. The coal in this mine was met at a depth of about 80 ft. from the surface. It was a very thick seam and had been worked on the pillar and stall system. It was necessary to keep the shafts well away from this area. Eventually the shafts were placed in the position shown on the map.

Circular v. Rectangular Shafts

Then eame the consideration of the size of the shafts. This problem had to be looked at from many points: (1) shape; (2) what ore would have to be hoisted; (3) capital cost; (4) ventilation. With regard to the shape, it was decided that they should be reetangular and not circular. The reasons whieh prompted this deeision were as follows: The proposed shafts, between 3000 and 4000 ft. deep, were to be sunk in a practically unknown area and through unknown strata, in which many weak places might be encountered. Poor ground can be easily held at any depth in a rectangular shaft, simply by bringing the sets eloser together. It is, of course, easy to make a circular shaft seeure when the sinking is performed in manufacturing countries like England and Germany. Tubbing necessary for the work is simply ordered for the job. In Africa this could not be done, and relianee would have to be placed on brieking the shaft. This did not commend itself. Again, speed in sinking is of primary importance in opening a new mine, and in Africa the men were already trained to sink and timber rectangular shafts and would have to start afresh if put to circular shaft-sinking and bricking. The speed factor was indeed two to one in favor of rectangular shafts. Owing to the depth of the shafts, it would be necessary to fix rigid guides in the circular shaft, so that even in good ground hitches would have to be cut in order that supports might be provided for these guides. This delays sinking to a serious degree. These drawbacks were considered to outweigh the many points of superiority that circular shafts possess.

*The Sir Clement Le Neve Foster Memorial Lecture, delivered at the Royal School of Mines, London, on Monday, January 27, 1913.

Of the other three factors, that regarding ventilation was decisive. It was rightly felt that mining on the Rand would in the future have to be carried out under much better conditions as regards ventilation than in the past, and upon investigation it was seen that the increase in capital cost for a 7-compartment shaft compared with a 5-compartment one was not serious. In fact, taking everything into consideration, it was better to be safe as regards ease of ventilation, by the adoption of the big shaft. Looked at from the point of hoisting capacity, it was felt that while a 5-compartment shaft would, with electric hoists, be large enough to cope with all the ore that was likely to be mined, yet the area was an unknown one and estimates of probable output might be far short of the actual requirements. Therefore, on this ground also, it was felt that it was a safe step to decide upon a 7-compartment shaft. The dimensions of the shaft are practically peculiar to the Rand. It consisted of six hauling-ways, 5 ft. by 6 ft. 6 in. The seventh compartment was a pump and cable-way and was 6 ft. by 6 ft. 6 in. The 6 ft. 6 in. dimension is the width across the shaft.

Equipment for Sinking

The equipment necessary to carry out the sinking of such a shaft with speed and economy must now be considered. The first point to be borne in mind is the fact that this sinking was being done in an unknown area far away from other mines; there was, therefore, always the possibility that the reef when reached would not be a profitable one, and that therefore anything in the nature of expensive permanent plant was not to be considered. Further, it was necessary to hurry the work; consequently, steel head-gears could not be ordered from Europe. Draughtsmen were consequently started at work, and the whole equipment was designed and ordered within a few weeks. It was first of all decided to have a 65-ft. wooden head-gear with surface ore-bins and flap-doors over the hauling ways to enable the bucket sinking to be carried on. For the shallower shaft, in which the reef was struck at a depth of 3100 ft., the principal items of the equipment were as follows.

Hoists.—Two 15 by 30-in. Ruston Proctor, double-drum, geared hoists were erected to serve, respectively, compartments 2 and 3, and 5 and 6. In this way the engines served the entire bottom of the shaft, leaving the end compartments and the middle one free. Geared hoists were selected for the sole reason that they were cheap in first cost and very efficient as sinking hoists that would have to be abandoned and scrapped as soon as the development period closed.

Boilers.—Care had to be taken to obtain a boiler which was fairly economical and yet possessed good water capacity and steam space, these features being of paramount importance in hoisting equipment. The fact that the available water was dirty had also to be considered, inasmuch as the boiler selected would have to be cleaned frequently and should therefore be very accessible. Bearing all these points in view, a boiler of the type known as an externally fired 16-ft. by 66-in. multi-tubular boiler of 125-hp. capacity was selected for each shaft. Three boilers were provided for each shaft. When increase in boiler capacity was made, a 250-hp. water-tube boiler was added, it being felt that the existing three boilers supplied sufficient steam space to justify the installation of the more economical water-tube boiler as a supplement.

As regards the other shaft where the reef was found at a depth of 3700 ft., the only difference in the equipment was in the provision of two 16½ by 33-in. Robey, geared, double-drum hoists instead of 15 by 30 in. The hoisting ropes used throughout the sinking were ¾-in. plow steel, ordinary lay, which gave a factor of safety of over 8 even at the bottom of the sinking.

Buckets v. Skips

It was decided that the sinking should be performed by the aid of buckets. Opinion on the Rand is acutely divided on the relative merits of buckets or skips as aids to sinking. The skip advocates point ont the safety of their method, while the bucket advocates enlarge upon the general handiness and quickness of their system. The decision between the two methods depends in a large measure on the temperament of the person to whom the matter is referred. I had no hesitation in deciding in favor of the bucket, though if the matter were referred to me now, with the added experience and judgment that comes with years, I think I would not be so certain. The sinking bucket used was of 20-cu. ft. capacity. It was attached to the rope capping (Fig. 2) by means of the falling pin connection (Fig. 3) which is safe and allows of quick detachment.

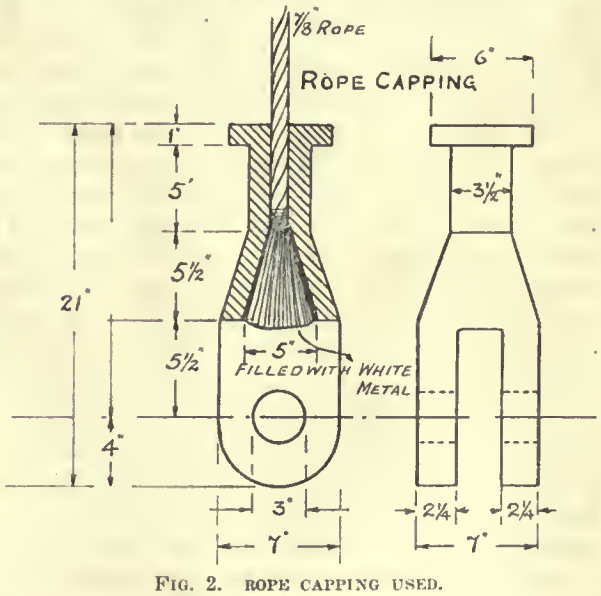

Fig. 2. Rope capping used.

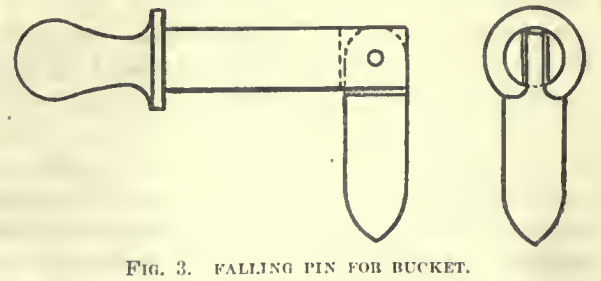

Fig. 3. Falling pin for bucket.

The rope capping (Fig. 2) was devised during the sinking in order to shorten the distance between

the cross-head and the bridle of the bucket; the ordinary splice that had previously been in use was about 12 in. longer, and in consequence allowed a dangerous swinging of the bucket while it was traveling through the shaft. The construction of the new capping is evident from the sketch. The manner in which the rope is attached to the sheath is as follows: The rope is pulled through the hole and then the end is untwisted and the individual wires separated and formed into a brush. This brush end is then cleaned by washing with caustic soda and rubbing with emery until the individual wires are perfectly clean. These are then tinned by first dipping them into a solution of zinc chloride and then into molten tin. The tinned brush is then pulled back into the cone sheath and molten white metal of good quality is poured in and fills up the space. This completes the work, and the resulting capping has never in my experience given the slightest trouble.

Cross-Heads

When sinking with buckets a cross-head must be provided, and it must be of such construction that while rigidly attached to the bucket during its passage through the timbered portion of the shaft, it can be released from this connection to allow the bucket to descend alone to the working bottom, the cross-head meanwhile hanging up and remaining fixed at the last timbered set. The cross-head resting on the stops is seen in Fig. 5. The cross-head used at Brakpan was a form known locally as Berry's. During the time the hoisting equipment was being erected the shafts were actually being sunk by means of hand windlasses. This work was necessary in order to get the collar set fixed in position.

Collar Set.—Unless hard rock comes right to the surface, it is necessary to secure a good foundation for the collar set. Thus, as is often the case, there may be 60 to 100 ft. of clay that will have to be secured before either the shaft may be permanently completed to that depth, or the collar set securely supported. To enter into a discussion of the many methods of doing this work is much beyond the scope of this paper. It must therefore suffice to describe the method which was used at Brakpan, where a hard rock known as 'Oude Klip' was found within 6 ft. from the surface. This 'Oude Klip' was of sufficient thickness to support the collar set, and under it the clay was hard and in it sinking could be carried on without the necessity of 'poling.' The only care necessary was to see that the excavation was not carried down for any considerable depth without first securing the walls with 4-in. lagging at the back of the timber sets.

The method of supporting the collar set can be seen in Fig. 4. Shortly described, the first stage consisted in cutting five trenches, two at either end of the shaft and three more at intermediate positions (under the first, third, and fifth dividers, respectively). These trenches were sunk in connection with the excavation for the concrete shaft wall enclosing the shaft. The bottoms of the trenches were leveled and, concurrently with the filling of the shaft wall with concrete, they were filled to the level given and worked up to a dead level in every direction. Upon these walls were then laid five 12 by 6-in. steel joists, 30 ft. long. These were then filled all around with concrete and the whole allowed time to set hard. Upon this bed the 12 by 12-in. pitch-pine collar set was placed. This set was constructed with great care and was carefully leveled and lined into position by the aid of survey instruments, and was then fixed with bolts to the girders. So fixed, this constituted the reference set, from which all the others were plumbed.

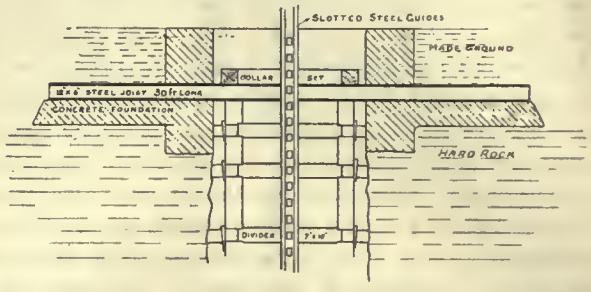

FIG. 4. SECTION THROUGH SHAFT WALL AND COLLAR SET.

It was necessary to provide a firm and adequate support for the collar set, inasmuch as if bad ground, against which it was found impossible to block the timbers so that they would be self-supporting, were met, the collar set would have had to bear the whole weight of this timber and maintain it in position until good ground was met.

By the time the sinking and hoisting equipment was ready for work the shafts were sunk and timbered for distances of 66 and 98 ft., respectively, in shafts No. 1 and 2. In passing, I may mention that hand sinking with windlasses is not economical beyond a depth of 30 to 40 ft., but in this case we were impelled to continue the system in order to accustom the natives to shaft work. When starting a new mine, the greater proportion of the labor available is green, and the training of the first units must be taken in hand as soon as possible. If the training of the first drafts is thorough, it will facilitate the training of those subsequent, for owing to language difficulties natives explain things much better to each other than can the white overseer.

The labor force, both white and native, for each shaft, consisted of 1 shaft overseer, 3 sinkers and 3 helpers, 3 timbermen, 6 engine-drivers, 2 banksmen, and about 300 natives. In addition, the general staff of the mine and set-maker and drill-sharpeners were available for both shafts.

Routine of Sinking

In order to make the actual system of work clear to you, I will assume that a round of holes in the shaft has just been blasted, and then follow the routine right through the working shift. The morning shift, which commences at 7 o'clock, is the best to describe, for during that shift the timbering of the shaft is also done. It will, therefore, be assumed that the sinkers in charge of the previous shift have just come to the surface and are counting the explosions resulting from their work. Having done this, they report to the leader of the oncoming shift the number of misfires. Without waiting, the sinkers and timbermen descend to the bottom sets of timber, where they carefully examine and clean

down any débris that may be lying there. The stops upon which the cross-head rests are then examined and fixed securely.

It is of the utmost importance that the sinkers should be able to get to the bottom as soon as possible after the blast. To do this, the smoke and gas resulting from the explosion must first be completely removed. This removal is effected in a cheap and efficient manner by the simple method of carrying down a brattice partition made of 1¼-in. tongued and grooved Oregon pine. This partition is carried on the dividers of No. 4 compartment, and is carefully fitted into the rough sides of the shaft. In a short time the shaft on one side of this partition constitutes itself an upcast and removes the smoke from the bottom. No mechanical aid is necessary after a depth of about 300 ft. is attained.

As soon as the timber has been cleaned down the sinkers go to the bottom, and the lowering of the natives constituting the shoveling gang commences. While they are being lowered, the sinker, his helper, and some of the experienced natives are dressing down the sides of the shaft, removing loose lumps that might fall, and otherwise making things secure.

Loading the Buckets

Bell boys are stationed at each signal rope and the removal of the débris from the last blast is started. To do this with the greatest speed it has been found necessary to use three buckets to each engine, but this is only necessary after a depth of 1500 ft. has been attained. It is at this point that the advantage of thorough training and organization of native labor pays best. Every boy engaged in this work has his allotted task and position in the shaft. Thus around one bucket are six boys with picks to loosen the rock and up to 18 shovel boys.

When only two buckets are in use, as soon as the bucket reaches the bottom the boys are standing ready with big stones—that could not be lifted on their shovels—in their hands; these they throw in, and then taking up their shovels they load for all they are worth. As soon as it is full the bell boy gives the signal to hoist, the bucket is lifted six feet in order to steady it and that the bottom may be cleared of loose material before starting on its journey. Another signal is then given and it is raised to pick up the cross-head resting on stops at the bottom set of timbers about 50 ft. up. It is essential, for reasons of safety, that the cross-head should be picked up very quietly, in fact we found it necessary to make it a positive rule that a pause should be made at that point. Directly the bucket has left the bottom the shovel boys step back to the sides and end of the shaft, and the pick boys come in to loosen the rock ready for the down-coming bucket. This bucket is stopped about 15 or 20 ft. from the bottom, and is only let down to the bottom on definite signal.

Necessity for Order

I have detailed this procedure in order to indicate the paramount importance of order and arrangement in everything concerning shaft-sinking. When it is understood that over 200 buckets of rock result from a blast, and that practically all this must be removed before the actual work of drilling can commence, and, further, that all the work of the shift, comprising clearing, drilling, charging, and fixing *must* be completed *within* eight hours, it will be realized that the organization of the work of clearing is essential to speed in sinking.

While the broken rock is being cleared the timbermen lower four weighted strings from the last blocked set of timbers to the sinker, who then stretches longitudinal strings, touching the plumb lines, along the sides of the shaft. He is thereby enabled to ascertain where, if at any place, the shaft is 'tight,' and thus be able to place holes that will remedy this. From Fig. 5, which shows the appearance of the bottom of the shaft during sinking, it will be observed that the ends are slightly higher than the middle.

In order to maintain good speed in sinking, the endeavor should always be made to keep the bottom as flat as possible: it facilitates getting about and gives level ground for the bucket or skip to rest upon. In practice the ends are just a little higher than the rest, and in consequence the sinker is able to start boys drilling at these high places, and also at the important corner holes, without delaying the work of clearing out.

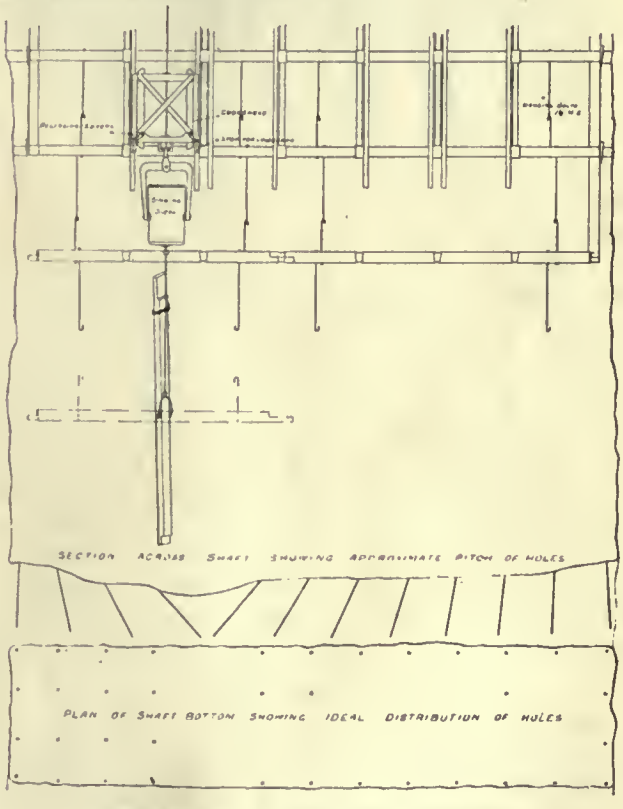

FIG. 5. PLAN AND SECTION AT BOTTOM.

The work of clearing is carried out in what would seem to be an unnecessarily complete manner; but when it is realized that owing to the close spacing of the holes in the shaft it is inevitable that some of them will be cut off before exploding, it will be seen that there is the chance of finding unexploded gelatine among the débris or an unexploded hole. Consequently, it is absolutely necessary to exercise the greatest care in clearing up thoroughly in order that all miss-fired holes and loose cartridges may be discovered before the boys are set to drill. At least 60% of the fatal accidents incidental to shaft-sink-

ing are the result of blasting accidents caused by drilling into miss-fired holes.

Drilling

While this thorough clearing out is being done, the sinker is starting boys in successive rows from the ends of the shaft. It takes four holes in average ground to break to the width of the shaft. It is impossible to indicate the actual position in which the sinker would place the holes, so much depends on the way in which the bottom has been left from the previous blast. The diagram (Fig. 5) indicates the general appearance of the shaft bottom when sinking is proceeding in good ground. In hard ground, the holes would not be so deep; they would in consequence be closer together and there would be more of them.

The last holes to be started, and the most important, are the sump holes. These are the leading holes in the shaft, so it is of the utmost importance that not alone must they be carried deeper than the others, but that they must be so set out and drilled that the ground between them must 'come.' Any failure of these holes would result in the whole blast being partly ineffective. The sump is carried about 10 to 12 ft. from the end of the shaft, and for ease of filling and bailing water is in the position where the end shaft-bucket rests. This is shown clearly in Fig. 5. Everything drains to the sump, and it is in consequence the last part of the shaft that is cleaned. For this reason the best boys in the shaft are kept apart as sump boys. Generally two, but sometimes three, are put on each hole, and every encouragement is given to them to drill deep holes.

While the sump is being drilled, the sinker and his helper are charging the finished holes in the other parts of the bottom. From 6 to 12 sticks of gelatine and two No. 6 detonators with two lengths of fuse each 12½ ft. long are inserted in each hole. As gangs of six boys finish their holes they are sent up to the surface, and so ease the anxiety as the shift approaches its climax. When all the holes are charged and the sinker has everything ready for firing, the timbermen are warned to leave everything safe and get out. The blasting signal is then given on the bell to notify the engine-drivers that they are to be ready as soon as a signal is given.

Firing the Holes

The firing is done by the aid of what is termed a 'cheesa' stick, which is made by cutting a gelatine cartridge into strips and wrapping these round a thin wooden rod prepared for the purpose. There are grave objections to the use of such material for this purpose, the principle one being that flaming gelatine gives off poisonous gases during the burning. But in a wet shaft no reliable substitute has so far been provided, and I would continue to use it on the grounds of safety and efficiency. With it you are certain of a flame that will not go out and which will light fuse under the worst possible conditions. In firing with the 'cheesa' stick one white man, with a native to cut the fuses, takes each end of the shaft. The sump holes are naturally lighted first, and then the men work toward the ends, lighting the holes in the order in which they wish them to explode. The length of fuse provided, 12½ ft. of 90-sec. speed, allows six minutes before the first hole explodes; but considering that the men are working in a space of only 42 by 9 ft., and that there is probably 100 lb. of blasting gelatine in the holes, there is every inducement to them to get through the work quickly. There is also every necessity on the part of the management to provide the men with the best and most efficient implements to enable them to carry out their duties quickly.

As soon as the shots are lighted the men and boys run for the bucket, ring the bell, and get up to the surface. This signal to the driver is also the signal to the banksman to lift the bell ropes from the bottom where they would be damaged by the shots, and also to lift the cluster of six electric lamps, by the light of which the sinking has been carried on. This cluster is carried on a wire rope from the surface and can be raised and lowered by means of a winch. This then completes the shift's work so far as the sinker is concerned.

(To be Continued)

Costs at the Perseverance Mine, Kalgoorlie

During 1912 the mill treated 234,636 tons of ore by roasting and cyaniding, and mine and treatment costs were as follows:

	Per ton.
Mining:	
Wages and contracts	$0.88
Explosives	0.14
Timber	0.01
Rock drills and air pipes	0.04
Candles	0.02
Steel	0.01
Tool sharpening	0.02
Assaying and surveying	0.04
Stores	0.02
General maintenance	0.11
Air for drills	0.10
Hoisting	0.26
Salaries	0.02
Development and broken ore debit	0.15
Total cost	$1.82
Less broken ore reserve credit	0.12
Net total cost	$1.70
Treatment:	
Rock-crusher	0.11
Ball-mills	0.53
Roasting	0.68
Grinding and agitation	0.52
Filter-pressing	0.42
Precipitation and clean-up	0.08
Disposal of residue	0.12
Total treatment	$2.46

Nevada Consolidated has completed its absorption of the Cumberland-Ely, and the latter company has been dissolved by the Supreme Court of Maine. The full capital ($10,000,000) of the Nevada Con. has now been issued, 543 shares having recently been listed. The outstanding shares of Cumberland-Ely, 1762 in number, can no longer be converted into Nevada Con. shares, but may be redeemed at $6.16 each. March production of the Nevada Con. was 5,555,320 lb. of copper, making the total for the quarter 14,525,560 pounds.

Hydraulic Elevator Work on Anvil Creek, Nome, Alaska

By C. W. Purington

The operation herein described is being carried on by the Pioneer Mining Co. on the claims known as No. 1 and No. 2 Below Specimen, on the gravel benches following the left limit of Anvil creek, Nome, Alaska. It presents unusual interest as an illustration of the handling of unfrozen gravel by the hydraulic nozzle with the accompaniment of the hydraulic lift and tailing nozzle.

Duty of a Miner's Inch

Accurate surveys were made during the past season at Nome to determine the points which are illustrated in the accompanying table. Calculations as to the amount of gravel handled in the hydraulic operations at Nome have generally been of a casual nature. Yardage in the bank is difficult to measure, the duty of the inch was not definitely known, and conditions from one year to another have varied to such an extent that conjectures as to the amount handled have generally been substituted for facts. From the data collected from 29 days operation of this plant, from September 11 to October 9, 1912, I have determined the duty of the miner's inch[1] working on unfrozen gravel, namely, 2.63 cu. yd. per 24-hour inch, working with elevator and tailing giant in addition to the piping giant. Knowing this important figure, and knowing the cost per day of the operation, I have been able to calculate the cost per cubic yard from the data at hand.

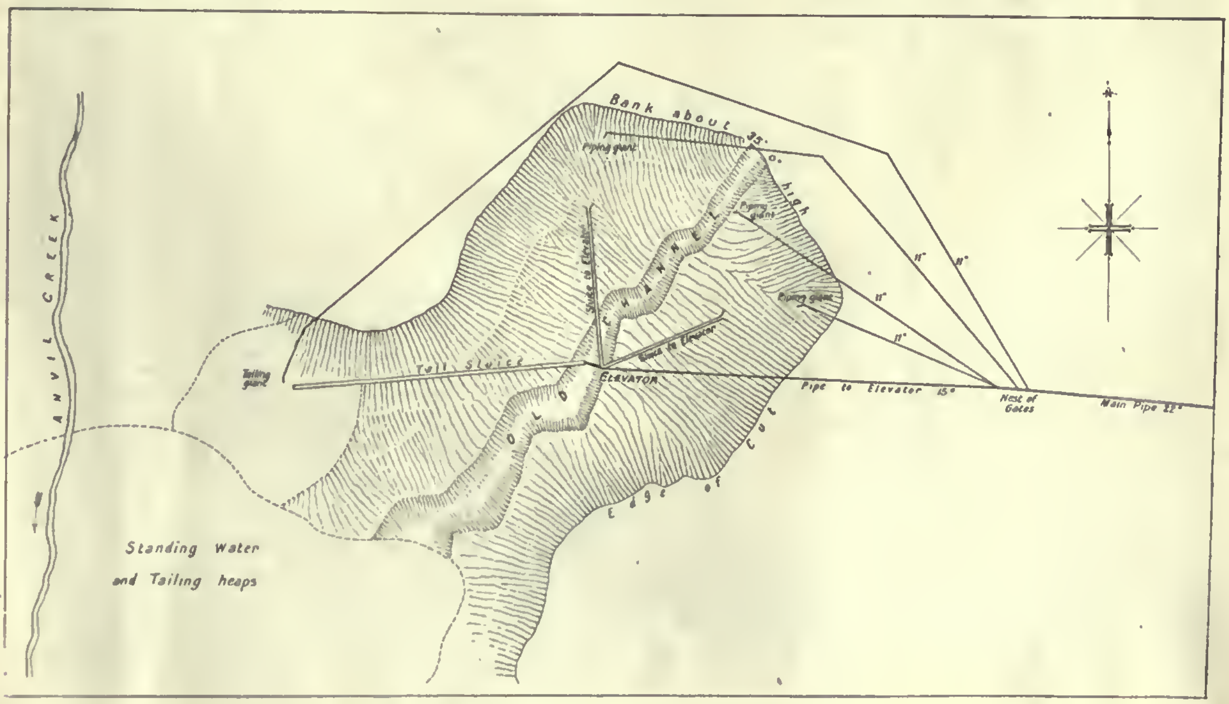
The work is supplied with water from a penstock situated just below where the small stream of Specimen gulch crosses the Miocene ditch, on the left side of Anvil creek.

The gravel, which is coarse and sub-angular with many medium sized boulders, occurs in the lowest and most westerly of the several bench channels which parallel the main present channel of Anvil creek. The channel worked lies at a distance of about 1000 ft. to the east of the present Anvil creek, all the ground between having been previously worked. The channel now worked in fact was formerly mined by drift, but the record of previous production is not available. The drift or underground mining did not, however, produce more than the gold contained in the lower 5 ft. of a narrow portion, the 25 to 35 ft. remaining above being left for extraction by cheaper forms of mining. Although no overburden tops the gravel, there is little or no gold in the upper 10 ft. of the 30-ft. average section.

PENSTOCK AT MIOCENE DITCH SUPPLYING ELEVATOR.

The bedrock of this portion of Anvil creek consists of hard laminated schist striking northwest,

[1]The inch of 1.5 cu. ft. per minute.



PLAN OF ELEVATOR SET-UP, ANVIL BENCHES, NOME.

BEDROCK ON No. 2 BELOW SPECIMEN AT ELEVATOR PLANT.

penetrated by a multitude of narrow quartz veins showing mineralization, and evidently the source of the placer gold. Eighteen men and one team of horses are employed on each shift of 10 hours. More than one-half of the men are employed in cleaning bedrock. So rich is the bedrock dirt that it has to be cleaned with coarse brushes after the piping is finished, and a certain amount shoveled into wheelbarrows. The bedrock sluice referred to in the table opposite, is used for only a few days at the end of each set-up. On account of the uneven bedrock it is necessary to pick the rich concentrate out of the crevices, and wheel and dump it into this sluice, which leads to the elevator throat.

Handling Boulders

The team of horses is constantly employed in hauling out of the cut, as ordinarily it is impossible to drive with the giant a stone over 8 in. diameter from the bank into the bedrock sluice which leads to the elevator throat. Nearly twice as many men are used in this place as are necessary in the hydraulic lift operations at Little creek, where frozen gravel is dealt with, but where bedrock is softer and more nearly level. The difficulties of hard bedrock are more than offset so far as the capacity of the plant is concerned by the unfrozen condition of the gravel. This place affords indeed a good illustration of the fact that where gravel in the Nome district has good drainage it is generally unfrozen.

The duty of the miner's inch in the specimen operation is 2.63 cu. yd., as against slightly over 1 cu. yd. in frozen ground. The operation in question was the portion of the ground which occupies the east central portion of the claim No. 1 Below Specimen gulch, and consisted of 1.0079 acres, of an average depth of 8.5 yd., from which were extracted 41,415.7 cu. yd. of gravel. The table opposite gives the essential details of the operation. The head in feet for each nozzle was determined by applying pressure gauges to the pipes, and the amount of water used by each of the three elements, namely, the piping giant, elevator, and tailing giant, was determined by computation, and the total checked by measure at the penstock with current meter.

Consumption of Water

The unwelcome fact is clearly borne out in the last column to the right that the elevator, which only serves to lift the gravel 26.5 ft. in order to get grade or incline for the disposal of the tailing, consumes more than two-thirds of the total water used in the operation, which water has been obtained at great expense and many miles of ditch construction.

The piping water, which actually does the work and fulfils its legitimate purpose of breaking down and moving the gravel to the sluice, is only 20.4% of the total used. Looking at the matter from one standpoint, it is proper to say that nearly 80% of the water is wasted, or does not perform its proper function. At the same time it is doubtful if any other means could be devised for working this particular ground on a profitable scale.

But the most interesting fact appearing from the test, in fact the crux of the whole matter, is the duty of the miner's inch. This is a factor which varies in different regions with different kinds of gravel and is subject to many conditions. For the elevator operation in question, the important duty is the so-called 'combined,' namely, 2.6324 cu. yd. of gravel for each 24-hour miner's inch of 1.5 cu. ft. per minute. In other words, this means that if 1000 in. of water were in use constantly at this plant under 1912 conditions, 2632 cu. yd. of gravel per day would be moved, washed, and stacked. Actu-

Hydraulic Elevator—Nozzle, 4⅝ in. diam.; throat, 10½ in. diam.; lift, 26.5 ft. from top of nozzle to bottom of sluice-boxes.

Sluice-Boxes—Dimensions: width, 30 inches in clear; sides, from 2 to 4 ft. high; length, 136 ft. Grade: 3 in. first or upper 12 ft.; 4 in. second 12 ft.; 5 in. third 12 ft.; and 5 in. each 10 ft. thereafter.

Riffles—Oregon pine blocks.

Piping Giant—Nozzle, 3 and 3 1/16 in. diam. (only one nozzle used at a time under various heads.

Tailing Giant—Nozzle, 2 9/16 in. diameter.

Pipe-Lines—Main, supplying all water, 22 in. diam. by 1429 ft. long; branch for hydraulic elevator, 15 in. diam. by 307.5 ft. long; branch, for piping giant No. 1, 11 in. diam. by 284 ft. long; branch, for piping giant No. 2, 11 in. diam. by 236 ft. long; branch, for piping giant No. 3, 11 in. diam. by 139 ft. long; and branch for tailing giant, 11 in. diam. by 889 ft. long.

Bedrock Sluice-Boxes—Plan, 24 in. wide, iron, without riffles.

Miner's Inch—Equal to a flow of water 1.5 cu. ft. per minute.

*Prepared by Arthur Gibson for C. W. Purington. †Estimated.
‡Intermittent work while cleaning bedrock.

ally a daily yardage was maintained of 1428.1 using an average of 542.5 miner's inches for all purposes.

Now assuming that only this amount of water is available for future operations, it is evident that were the use of the elevator not necessary, and could all the water be used for piping the tailing now entirely disposed of by gravity, a duty of 12.3812 cu. yd. per inch, or a daily yardage of 6716 cu. yd. could apparently be maintained. This surprising duty is possible on account of the unexpectedly high duty of the miner's inch when the water is used for piping only.

The bulk of the remainder of the gravel in this portion of the Anvil benches can be directly hydraulicked without the use of the elevator owing to its physical situation. I therefore consider it an amply conservative estimate to allow a duty of 6 cu. yd. per miner's inch and assuming that 600 miner's inches will be available, to say that the remainder of the Specimen Gulch gravel can be piped off at the rate of about 300,000 cu. yd. annually. This increased duty of the miner's inch will have a remarkable effect in lowering the cost per cubic yard, as given in the table on the following page and based on the cost of handling over 1400 cubic yards.

PREPARING TO MOVE THE ELEVATOR.

Estimate of Cost per Cubic Yard

The following table is compiled from the cost sheet covering a period of 29 days, directly preceding the period already considered, when all conditions were essentially the same. These figures are the closest approximation possible under the circumstances.

The amount charged for water is based on the actual cost of ditch opening and maintenance for 1912.

COST OF WORK FOR HANDLING 1431.31 CU. YD. PER DAY*

	29 days.	Per day.	Per cu. yd.
Foremen	$ 435.00	$ 15.00	$0.010
Common labor	5,303.33	179.77	0.126
One team (boulders)	527.22	18.18	0.013
Boarding house	1,650.10	56.90	0.039
Supplies—freight, tools, carbide, quicksilver, sacking, grease, lumber, miscellaneous	1,210.17	41.73	0.029
Total labor and supplies	$9,125.82	$311.58	$0.217
Total Miocene maintenance, normal annual	$15,278.85		
Divided by 4 for proportion to No. 1 and 2 Specimen for season	$3,819.71		
Total for period	1,110.70	38.30	0.026
Depreciation of plant, namely, pipe, giants, elevators, steel sluice-boxes, riffles, etc, exclusive of ditch.			
Arbitrary figure on basis of 10-year life at cost, $10,000, or $1000 for season	263.61	9.09	0.006
Total working cost	$10,500.13	$358.97	$0.249

Administration Charges

The above costs do not include general administration charges and it will be noted that they do not include the original cost of the ditch. I regret that it is not practical in the present instance to give these items. The additional cost which must be added depends in each case on the number of separate plants against which the total of overhead costs may be charged. The amount charged for original construction of ditch was nominal as its cost had been mainly written off, and amount charged for management, being distributed over four operations was only moderate. But in certain cases this amount might be very high.

The working cost is what concerns us here. Allowing 24.9c. as the cost when the duty is only 2.63 per miner's inch, it is apparent that as the duty per miner's inch increases, the cost per cubic yard decreases. The cost of the operations per season, say $43,000 for 120 days, remains constant.

The operations of next season or the year after will be on higher benches, and it is likely that elevator and the tailing giant will be dispensed with. Under these circumstances, the duty of the inch may be taken conservatively as 6 cu. yd. If all the water be used for piping, namely, 542.3 in., as in the operations of 1912, the annual yardage in a season of only 100 days, actual piping will be 325,380, and the cost instead of 24.9c. will be 13.2c., a decrease of 47%. Every inch of water used for piping in addition to the amount used in the example above will increase the yardage and decrease the cost per yard.

There are generally two piping nozzles set, fed from the main pipe-line, and only one is operated at a time. In practice it is found that with a bedrock steel sluice laid on the grade, the face can be carried to a distance of 150 to 250 ft. away from the throat of the elevator in any direction. The elevator used is of the Campbell type, having 10½-in. throat and upcast pipe 15 in. diameter. As all details concerning the amount of water used for each element, size of nozzles, head, and length of pipe-line are given in the table, I will not repeat them here.

*Including all labor, foremen, tools, supplies, teams, hauling, boulders, boarding-house costs, and freighting.

Progress at the Inspiration Mine

By C. E. MILLS

*The operations described in the following report of work done at the Inspiration Consolidated Copper Co.'s mines during 1912 fall into two divisions—the underground work preparatory to the extraction of the developed ore, and the construction of the surface equipment necessary for the handling and reduction.

At the close of the year the total underground work in the Inspiration and Live Oak divisions of the mine may be summarized as follows:

	Prior to Dec. 31, 1911 (ft.).	During 1912 (ft.).	Total, Dec. 31, 1912 (ft.).
Drifts	32,655	25,355	58,010
Raises	2,902	4,676	7,578
Shafts	3,366	2,348	5,714
Miscellaneous	90	454	544
Total	39,013	32,833	71,846

Ore Reserves

Except for 1795 ft. of drilling done on the boundaries of the Live Oak property, and which did not add to the ore reserve, the churn-drill record for the property stood at the end of the year as at the beginning—229 holes, with a total footage of 124,886. The drilling record shows the following:

	Inspiration orebody, ft.	Live Oak orebody, ft.
Average thickness of capping	354	435
Average thickness of ore	142	114

The underground work of 1912, which was practically done during the last half of the year, was preparatory to ore extraction within the ore areas developed by the churn-drills, and was not designed to be exploratory in character; therefore the work has not resulted in any additions to the estimate based on the churn-drilling at the time of the consolidation, which was 45,000,000 tons of 2% ore.

No mining method except one of relatively high cost could be used that would deliver this ore to the surface practically free from admixture with barren capping, and it has been calculated that better net returns will follow the use of a cheaper mining method, though this method will inevitably reduce the grade of the mill ore. An attempt has been made to check the original estimates of ore tonnage and grade in that part of the mine where

*From the annual report of the Inspiration Consolidated Copper Company.

sufficient underground work has been done to render such a procedure reasonable. The regular mine samples have been checked by a second careful and independent sampling of such underground work, and these confirm the figures of Henry Krumb, the engineer under whose direction the churn-drill sampling and estimates were made.

The ore block sampled consisted of 600 ft. of the Joe Bush orebody lying immediately west of the eastern end-line of the Joe Bush claim. The comparative figures are as follows: Original estimate based on five churn-drill holes and 4325 ft. of underground work; tons of ore, 2,475,000; per cent copper, 1.95. Recent estimate by V. A. Hart, based on sampling of 15,165 ft. of underground work in same block; tons of ore, 2,525,000; per cent copper, 1.93. Estimate made by substituting regular mine samples for Mr. Hart's samples of same underground working; tons of ore, 2,525,000; per cent copper, 2.

This estimate very properly covered sulphide ores only. The drill-holes, however, show in addition, above the total area of sulphides, approximately 8,000,000 tons of oxidized and semi-oxidized ore averaging 1.4% copper, and there is unquestionably more in other adjacent areas. This semi-oxidized material has been classified, through conservatism, with the barren capping. It immediately overlies the ore. In any caving system of mining it will replace in part the otherwise barren capping that unavoidably in some degree will be mixed with the ore. In grinding this material the oxide copper is largely concentrated in the slime. If this oxide copper were treated by leaching as auxiliary to the regular sulphide concentration, it is probable that such of this semi-oxidized ore as is unavoidably drawn with the sulphide ore in caving might be made to yield net returns above the reduction costs.

The ore from the mine will be hoisted through two main shafts, 104 ft. apart, on the Gift claim in Webster gulch, and outside the known orebody. These two shafts have each been sunk to a depth of 585 ft., such being a suitable distance below the second and lowest level of the Inspiration mine.

Construction Work

The surface construction has been various, the main items being:

Erection of steel head-frames at the two Live Oak shafts. Enlargement of the temporary power-plant and shops at the mouth of the Inspiration adit. Erection of a supply-house at the same place, and another at the junction of the Inspiration railroad with the Arizona Eastern railroad. Building of a dam and excavation for pumping plant at Wheatfields, on lower Pinal creek, the source of water-supply for the mill. Joint construction with the Miami Copper Co. of an emergency hospital for employees. Construction of quarters for housing employees. Building of roads and the grading of the mill-site. Work on the Inspiration railroad. This line will be about 4½ miles long, of standard gauge, and will connect the mine with the mill, and this in turn with the Arizona Eastern railroad. The grading for this line was not completed last year, but is substantially finished at this date, except for one cut, which should be out in forty days. This line, together with an extension of the Arizona Eastern railroad from Miami to Live Oak, likewise now nearing completion, will furnish railroad connections to the main working points of the property.

Building the Mill

The contract for the steel construction of main head-frames, coarse-crushing plant, ore-storage bins, and concentrator building was let last November, and at this date the first of the material is under shipment. The work on the concentrator building proper has been held up pending possible changes in detail. A ten-year contract has been made with the United States Reclamation Service for hydro-electric power from power-plants in the Salt River project, and the power-line is now under construction.

No suitable millsite was available near the main shafts, but a very satisfactory one has been acquired about 1½ miles from the main shafts, together with ample and convenient ground for tailing storage. Plans have been made by H. K. Burch, as chief engineer, for a concentrator of 7500 tons daily capacity. The coarse-crushing plant will be at the main shafts, and the ore, after being crushed to a 1-in. cube, will be transported by rail to the fine-crushing plant at the mill. The ore-storage bins at the mine and mill will have a total capacity of 40,000 tons. The railroad line of 1½ miles from mine to mill, over which the heavy tonnage will move, will have a down grade to the mill of 0.3 per cent.

Previous to the consolidation, the Inspiration Copper Co. had made on a working scale, in a plant erected for the purpose, a long and careful series of tests on the concentration of its ores, under the direction of J. M. Callow. The result of these tests and of a flow-sheet worked out by Mr. Callow promised very good results for water concentration. In December last the company arranged with the Minerals Separation, Ltd., to make a trial of its flotation process. A plant of 50 tons daily capacity has been erected, and tests are now being made, from the results of which will be determined whether or not this process will be adapted to the treatment of the Inspiration ore.

The idiosyncrasies of the labor situation in Butte have brought new problems to the attention of the Eastern representatives of the General Electric Co. who have charge of the electrification of the Butte, Anaconda & Pacific railway. Paying $5 per day to electricians on one side of a county line and $4.50 per day on the other, did not seem reasonable at first. But after they had finished the work on the $4.50 side of the line they at last saw a great light and came to understand how wondrous were the workings of the Silver Bow Trades and Labor Assembly. So that now the work is to go merrily on and should be completed about the first of the year. Incidentally, the honest day laborer on the job demanded and is to get $3.50 for the 8 hours from the time he steps wearily on to the work train which carries him to the scene of operations in the morning until he steps lightly off said train in the afternoon.

Miners Versus Technical Men

By A Commissary

In the *Mining and Scientific Press* of Mareh 1, under the title of 'Mine Administration and Mine Bosses,' appeared an interesting article by some one signing himself 'A Miner.' Having knocked about the West from Nome to Panama, and having heard the same line of argument advaneed in bunkhouses all over the territory, it seems worth while at this time to take up the eudgels for the other side, in order that 'A Miner' and other intelligent miners may glimpse themselves for onee as others see them. I have been what might be termed a hanger-on of the mining business since my early teens. Raised in the West near the mines, not being able to seeure a eollege education, being of slight physique and hardly fitted for manual labor, it was natural for me to drift into timekeeping and commissary work and to remain there. And while following these lines of work, I have seen a great procession of miners, bosses, sehool of mines men, and farmers drift by me.

Are Technical Men Inefficient?

'A Miner' said in his artiele that "usually 95%" of mining inefficieney is found in the superintendent's office, and his artiele, as a whole, is a 'roast' of technical men, or as he terms them 'School of Mines men.' To the general publie, of eourse, no apology is neeessary for the great technical schools and eolleges seattered all over our eountry; but that 'A Miner' may know that there is an answer to the diatribes that he and his sort are so fond of spouting, his attention is called to the following argument.

To begin with, his article is illogical in that it condemns eollege men as a elass. All college men (classed) are no more ineffieient than all miners (elassed) are 'boneheads.' It takes an oecasional exception even to prove a rule. Generalizations are unsafe. His first argument against sehool of mines superintendents is that they change the old methods and then have to change back again. Possibly so. So might a praetical miner, who had never seen a school of mines, be inclined to try some method he had formerly used on taking eharge of a new property. If it didn't work and he saw that it didn't —good for him. if he is wise enough to change baek. The next argument made is that sehool of mines superintendents have a liking for importing men from their (the superintendent's) old stamping-grounds. This is quite natural, and especially so if he finds that any ideas he may have that he wants tried out are opposed tooth and toenail by the old-timers on the ground. It is a mistake made quite frequently by practical miners as well as school of mines men. I heard of an old 'Cousin Jaek' who got to be mine-boss who had one invariable question to put to applicants for jobs. His question was, "Has 'oo ever worked in Boote?" If the answer was yes, the man got the job if there was a vaeaney. If it was no, he didn't. And when there were no applicants and men were needed, he sent to 'Boote' for them. Now though this boss had a peeuliar manner of hiring men, it was said of him that he operated the mines with considerable suecess, as might be supposed, sinee there are many good miners who have worked in Butte. The point is merely that he was clannish and wanted men around him with whose type he was familiar.

Educated Superintendents and Profits

'A Miner' further says that he does not believe a superintendent (from a school of mines) ever took personal eharge of a mine and made it pay. Indeed! Now because a youngster has had the benefit of a eollege edueation, no sensible man will contend that he is therefore capable of handling to advantage a erew of men; but neither will any sensible man argue that because of his college years it has become impossible for him to aequire the knack of managing men. He may or may not beeome a good manager, but it is illogieal to damn him in advance. Western sehool of mines boys have a habit of working during their summer vaeations in the mines, and I have known many to be able to do a good day's work for their money, but I have yet to meet a hard-roek miner who would admit their ability. Of course, among the students are exeeptions who do not do a shift's work and do not expect to, but that is hardly to be eharged against all college men. Apropos of this matter of a superintendent's ability, or lack of it, personally to manage a mine, does 'A Miner' know of any praetieal miner of his aequaintanee eapable of managing a mine—ineluding the financing, aeeounting, surveying, assaying—without ealling to his aid technieal men?

The Gentle Art of Eating

'A Miner' next takes a shot at the superintendent for eating in a private dining-room, instead of eating with the men. It never seems to occur to men of his type that the principal reason why the office foree often group themselves at a private table, where they usually get the same fare as the miners, is to avoid hearing, day in and day out, the 'practieal miners' kicking at the grub. The fare is usually as good as can be provided for the money, and the erowd from the office are, as a rule, men who have been well raised. While the bill-of-fare may not be sueh as they would deliberately ehoose, they realize the limitations, make the best of them, and seldom eritieize. To sueh men it is sometimes disagreeable to sit down among a bunch of 'rough-necks' and hear the string of ill-natured eomment from soup to dessert. Now, Mr. Miner, I know that in allowing myself the use of the word 'rough-neck' I am guilty of generalizing also—as I make haste to add—poor table manners are not universal among miners.

Just a word about mine boarding-house fare. Ten years ago, when eommodities were almost 50% cheaper, miners throughout the West paid $1 per day for board. Now they are still paying $1 per day.

The increase in the cost of living has 'never touched them.' 'A Miner' says that dissatisfaction over the boarding-house is less common where the bosses eat at the same table with the men. Right you are—the principal reason being that, with the bosses present, three-fourths of the kicks are unuttered owing to the restraint of their presence; the remaining one-fourth being possibly deserved. 'A Miner' further inquires why it is that all 'school of mines' superintendents believe Chinamen to be the only people capable of running mine boarding-houses, and asks why they don't get "clean white women." From the query, I take it that 'A Miner' has gleaned most of his experience at mining in the Pacific Coast states, as the Coast is the only locality I know where Chinese kitchen crews are regularly employed. The answer as to why "clean white women" are not employed in isolated mines and camps is one I will leave to 'A Miner' to cipher out, merely advising him to think it over, and not to blame miners (classed), but just human nature for certain natural tendencies. I don't believe, though, that the superintendent has any special love for the Chinese.

Geology and Much Talking

'A Miner's' next complaint is that superintendents talk geology to the 'muckers.' Perhaps some of them do. 'Loud-mouthed' men exist in all classes, with or without a college education, and the tongue is an unruly member. Still, I would rather hear an educated man talk than one who is uneducated. Wouldn't you? 'A Miner' then says that school of mines superintendents are always harping on the inefficiency of labor. Now I will admit that I have heard some of that sort of talk when I thought it undeserved, and from superintendents whom I thought to be incompetent; but I have heard so little of it as compared to the amount of talk I have heard from men about the incapability of their bosses, that it hardly weighs in the scale. One benefit of a college course is the broadening of the mental horizon, and from this benefit comes, in most cases, a broad tolerance and understanding of the environment of the mine employee, so that but little attention is paid to the general grumbling about a mine. Coupled with his complaint that the superintendent grumbles about the inefficiency of the men, 'A Miner' asserts that they insist on hiring all the help themselves and are not capable judges of efficiency. This might be a reasonable complaint if it were true. I have worked under several mine superintendents myself—not as many, to be sure, as 'A Miner', who claims to have had experience with 40 or 50—but I have never yet seen a superintendent who insisted on hiring the mine-workers. Usually, the foreman has a 'hang-out' at some 'joint' in town where all his men are hired—and a bottle of 'booze' from the aforesaid 'joint' is a great lubricant of the process of securing employment; not mentioning at this time cases where even greater graft is involved.

By Way of Summary

Now the gist of the whole matter seems to be that no one man is perfect, to say nothing of an entire class of men, and men of any class are liable to make mistakes; but for 'A Miner' to assert, as he does, that all 'school of mines' superintendents are fools is the height of absurdity. I knew one such man, a foreman and an efficient one, who went to Panama to work on the canal. He did not 'make good' there, and soon returned to his old 'stamping-grounds.' When asked what he thought about the canal work, he had not words to express his scorn of the methods employed there, and loudly asserted that 'school of mines' boys were running everything into the ground down there.

The mining business, as is true of most other occupations in this country, despite temporary setbacks and in spite of more or less inefficiency of superintendents, school of mines men, miners, and foremen, is progressing. One foreman I know objected to college-boy samplers, and insisted that the only one who could practically sample a mine was a miner. He was allowed his way, and his samples all ran higher than the mill average; but since he insisted that his samples were right, the technical men may have been wrong. Another foreman, without being conscious of a prejudice, hires every farm-boy who comes along, to the exclusion of old-time miners. His farmer shift-boss breaks them in and they do good work, so the foreman is efficient.

Why Not Be a Superintendent

From his article 'A Miner' would seem to be a man of intelligence and ability, and with ambition. To such a man there should be a future in the mining business. Why doesn't he fit himself (if he is a young man) to become a superintendent? Mining companies are on the lookout for good men. If, however, his youth is gone and it seems impossible for him to overcome his early handicaps, I hope that some day he may 'hook up' with a wise superintendent, one who will understand him and whom he can understand. One to whom he will freely give of the best that is in him, of his practical knowledge of mining, and one who will know how to profit by this practical knowledge, adding thereto the benefit of his own theoretical and technical abilities in such manner that the result will be honor and profit to both, without jealousy or recrimination. If, on the other hand, 'A Miner' is at present 'hooked up' with such a superintendent as he describes, why on earth doesn't he quit his job? In no place more than in the operation of a mine is loyalty, enthusiasm, thorough confidence, and understanding more valuable, and in no other place is it more necessary that one 'get out or get in line.'

Australian trade in 1912 aggregated $753,278,500 for a population of approximately 5,000,000 people. Exports and imports were practically the same total, and the former included gold worth $59,728,500, and minerals worth $41,469,200, while the latter included gold valued at $8,092,800.

German iron and steel exports during 1912 totaled 6,000,000 tons, worth $280,000,000 (preliminary figures), against 5,400,000 tons in 1911, and 4,800,000 tons in 1910.

Organization of Smelting Enterprises—II

By Herbert Lang

The pay of the various classes of workers at a smelter varies greatly, being influenced by the custom of the country, the degree of proficiency shown, and by other contingencies. The manager of a large metallurgical works in America oftentimes receives as much as $10,000 per year, with instances where considerably more is paid. His pay is sometimes contingent upon the financial success of the enterprise, to which his services may contribute greatly. Considering the heavy responsibilities of the position, and the large amount of detailed knowledge demanded, such a salary cannot be considered unduly large, and is not greater than such a man would naturally earn in any other occupation demanding equal business skill. Superintendents subordinate to managers receive from $250 to $500 per month, according to circumstances. Those whose duties include business as well as technical management naturally get the most. It is difficult to estimate the pay of metallurgists, but it is probably about equal to that of superintendents, with the exception that there is a class of self-styled metallurgists who perform only the commoner functions of the office and receive hardly more than the pay of assayers. From this comparatively low plane we rise to that of the foremost men of the craft, who combine the duties and abilities of superintendents, or even of managers, with their own higher technical powers and are paid accordingly. Such persons, being supposedly capable of conducting the affairs of the concern in all respects, are expected in case of need to furnish the designs of new buildings and parts of the works and receive high pay therefor. Metallurgists who have attained proficiency in the practice of their art are sought in consultation by parties who have need of advice or assistance in the preparation of plans or the conduct of metallurgical work. They are then called metallurgical engineers, or more restrictedly, consulting metallurgists. This branch of effort, when it concerns the planning and construction of new or the rehabilitation of old plants, does not differ in character from that carried on by ordinary constructing engineers. Men of this sort, if well known, frequently receive very high compensation for such services, as high or higher than those engaged either in civil or mechanical engineering.

Metallurgists and Inventions

If of a reflective or inventive turn of mind, the metallurgist will find a great field of usefulness open to him in improving the apparatus and operations of his chosen branch. It is thought by those familiar with the growth and recent history of metallurgical engineering that there are few other pursuits that offer such strong incentive to the young and ambitious, and few professional means of livelihood that surpass it in the certainty and magnitude of its returns. The assayer, as a rule, expects to receive about $100 to $125 per month, if fairly proficient in his calling. Some are hired at much less, some at much more, depending mainly on the locality. In some regions, as at Butte, Montana, the custom has been to pay the assayer a daily wage of from $4 to $4.50 per day instead of the monthly allowance. Chemists are paid rather better, owing, no doubt, to the comparatively greater complexity of their work and the greater experience necessary to get reliable results. Probably $150 to $200 per month will cover the extreme range of their compensation.

Foremen and Wages

In addition to the above groups of employees, who invariably receive their wage on a monthly or yearly basis, there are others who in the practical running of the plant are hardly less important, but, as they are paid wages and not salaries, are less regarded. They are the foremen, who take personal charge of the routine work, subject to orders of the superintendent, to whom they report. They are commonly two in number, the day and the night foremen, and are persons who have risen from the rank and file of the operatives, having been distinguished by their skill, intelligence, and devotion to their company's interests. As they stand between the ordinary workmen and their officials, they occupy positions of no mean importance in relation to the welfare and success of the company. It will be found that the wages paid to these men, while on the daily and not on the monthly basis, are often higher than those obtained by the assayers, who are commonly regarded as superior in standing. The reason undoubtedly is that the position of foreman requires a man of tact and good understanding and experience, while the assayers are much younger men, of better education but less experience, who are, as it were, undergoing a probation in the practical affairs of life, and who are prone to look upon their billet as a sort of stepping-stone to something better. The average wage of a good foreman is $5 per day, or $6 in the more important establishments. In a properly regulated concern, all orders to the men, instead of being given direct to them by the superintendent, manager, or other person in chief authority, are transmitted through the foreman, for he it is who is directly responsible for their proper execution. In this way misunderstandings are avoided and proper discipline is maintained. In order to maintain the foreman's authority over the men, he is intrusted with hiring and discharging them, all applicants for such positions being referred to him from headquarters.

Below the foreman come several individuals who in large works perform services somewhat aside from the usual run of laborers and receive rather higher pay. They are the samplers, weighers, timekeepers, etc. Their duties are variously performed according to the size of the works, it being found that the larger the establishment the more special-

ized the duties, until in very large concerns there is an almost complete division of labor, the result of which is that no individual is expected to perform any work at all outside of his narrow specialty. This peculiarity of large concerns is the opposite of that in small establishments where every man is expected to make himself generally useful, and where, in consequence, the inquiring student, bent upon perfecting himself in the whole body of the art of ore reduction, has an ampler opportunity of doing so.*

Office Force and Workmen

The subordinates are the office force, especially clerks, who are under the immediate control of the superintendent, and the workmen, skilled and unskilled, who carry on the labor of the plant. The latter are divided into classes according as they perform routine or occasional work about the place. The former class consists of the men who attend the furnace, including the tappers, the slag-wheelers (in case the barbarous and wasteful method of discarding the slag by manual power is followed), the feeders, the charge-wheelers (giving way to the drivers of horses and better methods of bringing up the charges), the day and night foremen, and generally a weigher on each shift. With these are two or three yardmen and an ore sampler, whose work goes on more or less steadily. The class of intermittent laborers contains principally roustabouts, an uninteresting and not too intelligent class, composed usually of foreigners whose business is to fetch and carry. They have the stowing away of the ore, the guiding of the useful but antiquated wheelbarrow, and other jobs for which machinery is inadequate. This is the class that gives the most trouble, works the cheapest but costs the most, and of which managers are always anxious to be rid. These individuals receive salaries and wages in the West about as follows:

Manager, on term contract, per year	$6,000—	10,000
Superintendent, unlimited time, per month	250—	350
Metallurgist, usual contract, per month	250—	500
Assayer (per day $4 to $5), per month	100—	150
Chemist (per day $4 to $5), per month	150—	200
Sampler, per day		4
Foreman (day), per day	5—	6
Foreman (night), per day	4—	5
Tappers and feeders, 12-hour shift		3.50
Slagmen and charge wheelers, 12 hours	2.50—	3.00
Roustabouts, per day of 10 hours		2.00

The total number of men connected with the running of one furnace and performing their duties at the works is usually not less than 20, and if the carpenters and others whose exertions are frequently but not constantly employed be included, it may rise to 40. On the other hand, there are many small plants which need but a dozen or so of men, but these of the best class. The number employed will depend mainly on the arrangement of the machinery of the plant, its adaptation to the purposes intended, and the inventiveness and originality of the designer. In these respects there is a vast difference between plants and a corresponding difference in the cost and perfection of the work they do

The consulting engineer, in name, at least, if not in principle, is the outgrowth of recent conditions. It has become quite the fashion with mining and metallurgical organizations that may desire to carry on their work in a more than ordinarily thorough style to employ consulting experts, much the same as one would employ an attorney or a physician. The consulting expert is a professional person who prescribes and gives advice. He has no authority, and is not supposed to participate in the management or conduct of any part of the business of his employers for the time being, but merely to observe conditions and plan and advise. The same qualifications which make the physician or the lawyer valuable to his clients must be possessed by the consulting engineer—namely, varied accomplishments, deep insight, and extended experience. It is not every new company that is circumstanced so as to avail itself fully of such qualifications.

Where Engineers Are Not Wanted

In the first place, the tendency of beginners is to postpone the employment of the higher sort of professional assistance until a late date, under the erroneous impression that a small enterprise, and especially one in its earlier stages, has no need of particular skill or knowledge. This is a great mistake. If to this be added the natural feeling of dislike that many men have to association with persons of talent or attainment beyond their own, sufficient reason is found for the omission of many companies to employ skilled engineers in their work. There is something also in the desire of ambitious members of companies—stockholders, it may be—to distinguish themselves by conducting the work in person. No doubt the same is to be expected in any other pursuit; for human nature is much the same everywhere and under every condition. Should the new company contain no member experienced in mining or metallurgy, it will ordinarily dispense with high-class professional assistance, at least until mistakes have been made and recognized, and some loss of time and money incurred. Experience frequently induces them to place their affairs finally in some measure in the hands of qualified persons, among whom the consulting engineer may be one. Should he possess the requisite skill, integrity, and experience, together with enough force of character to impress his views upon his associates so that they feel impelled to carry them out, his engagement will likely be of great advantage.

According to the circumstances of the case, the engineer may have been hired either to give advice,

*This feature should be borne well in mind by students and others wishing to familiarize themselves with the operation of general metallurgy. It is better for such to connect themselves with small establishments, where their opportunities for obtaining practical knowledge of many branches are much better than in large concerns, where the tendency is to confine employees to particular occupations. Entering the service of a small company which is about to begin operations in ore reduction, it is not difficult for the young assayer, chemist, surveyor, or clerk to obtain practice in nearly or quite every line of occupation about the works. With much profit to himself he may be in turn millman, tankman, weighmaster, slag rustler, furnace tender, or roaster-man, and acquire within a short space information and practice which will be of immense value in later life. Without this practical knowledge in the handiwork of metallurgy it is impossible to achieve the highest degree of usefulness in the various branches of the calling. There is no doubt that the most successful metallurgists are those who, in addition to a wide theoretical knowledge of their craft, have also a practical knowledge of how to do it; that is at least as valuable.

to plan works and supervise their construction, or to do both. Or he may even have been asked to direct the running of the plant after it has been built. If his duties are solely to give advice, his designation properly is consulting engineer or consulting metallurgist; if to plan the works, he may be termed the designer; if to supervise the building of the plant, he is called the constructing or superintending engineer; and if to conduct it subsequently, he is rightfully called either the manager or superintendent, according to the nature and extent of his services. In the former case he resembles the attorney who confines himself to chamber practice. He has clients, perhaps several at one time, to whom he gives advice, but his time is not, unless by special arrangement, wholly at the disposal of any one of them, and he bases his charges upon the character and extent of the services rendered, or even, as do other professional men, perhaps upon the supposed wealth of his clients.

No one, not even the manager, has so many and favorable opportunities to benefit his company as the consulting engineer. Viewing the entire field of their activities in the light of his wider experience, he sees many possible improvements in their practice and methods. Doubtless the career of every such engineer contains instances where in the compass of a single letter of advice he was able to save his company the amount of his salary for the year. A hint to a careful foreman about the conduct of the work, or a suggestion as to the saving of some hitherto unregarded by-product may often produce an almost invaluable effect upon the fortunes of the company. If mining and metallurgical companies knew how faulty even the best practice is, and how easy it is for the experienced engineer to suggest improvements, the employment of expert assistance would be the rule and not the exception. Consulting engineers might reasonably be paid according to the savings they are enabled to effect. Thus, if by some suggestion an economy of so many thousand dollars per year results, he might receive one-half or one-fourth of the sum for a stipulated number of years, or as long as his engagement lasts.

Visitors and Publicity

Metallurgical works should always be open to the visits and criticism of qualified persons, instead of being, as so often the case, shut against the outer world. The free exchange of ideas by the staffs of various works has done more for the prosperity of companies and for the advance of metallurgical science than any other cause which can be named. Those concerns which shut themselves up jealously, refusing the common courtesy of a visit of curiosity, are almost invariably behind the age in some department, perhaps in all, and manifest a disposition which is, to say the least, inharmonious with the spirit of the times. This narrow and illiberal spirit, which manifests itself oftenest in the behavior of those foreigners who have been received on our shores, reacts most injuriously upon the fortunes of those who practice such exclusiveness, and also on the progress of the arts which they make, as a rule, so much pretense of understanding.

Continuous Decantation Versus Filtration

By H. St. J. Brooks

*Of late there has been a good deal of discussion on this subject, and between the various views it may be possible to steer a middle course. While frankly admitting the fact that filtration is a necessity for certain ores, it nevertheless seems to me that for many others continuous decantation, supplemented when necessary by a final dewatering on a rotary type of filter, has a distinct future. In metallurgy, as in every other field of endeavor, there is a general tendency to follow the prevailing fashion. A new process, a new machine is introduced; at first it is eyed askance, then some well known mine takes it up, it is proved successful, and it immediately becomes the panacea for all imaginable metallurgical ills. This, in itself, tends to bring about a reaction, and just as even the Pachuca tank has reached its zenith and is now slowly giving way to other forms of agitators, so there is beginning to be observed in the United States, the home of vacuum-filtration, a reaction against the idea that filtration is essential in all cases to the modern slime plant. It may be granted that for those ores where the greater part of the gold or silver is locked up in the sulphides, for high-grade ores and those requiring treatment with extra strong solution, filtration is necessary. But where the bulk of the precious content is present in the silicious part of the ore, and especially for low-grade ores requiring only moderately strong solutions for beneficiation, I think there is a wide field for continuous decantation.

Reaction Against All-Sliming

The writer of an editorial in the *Mining and Scientific Press* deals with the question from the standpoint of the all-sliming mill alone; but it must not be forgotten that not every mill, even nowadays, is an all-sliming one. Indeed, there are already signs of a reaction against the too prevalent employment of all-sliming as opposed to fine grinding. I am one of those who agree with E. M. Hamilton, Stuart Browne, and others, that many ores now being all-slimed in deference to the prevailing fashion would give a better commercial extraction by crushing to about 100 mesh, separating the sand from the slime, and treating both products independently. As a case in point, the management of a gold mine in the Orient which all-slimed its ore was considering the installation of an additional 20 stamps and two tube-mills in order to increase the mill tonnage. A little laboratory investigation revealed the fact that the sand at 100 mesh gave good extraction by leaching, and the bulk of the metal contents were in what may be termed the natural or colloidal slime, as opposed to granular slime produced by finer comminution of the 100-mesh product. It was therefore decided to crush with much coarser screens, separate out the sand at 100 mesh, and leach this in a sand plant erected at a trifling cost compared to that of 20 additional stamps and two tube-mills. To my mind,

*Abstracted from the *South African Mining Journal.*

the ideal treatment of a low-grade, oxidized, non-complex ore is that of coarse stamping, tube-milling to about 100 mesh, amalgamation after the tube-mills if necessary, classification, leaching of the sand, and continuous decantation of the slime through Dorr thickeners, finishing with some simple continuous dewaterer of the rotary type. Undoubtedly it would be far simpler to dispense entirely with the final filter treatment, particularly as there seems every reason to suppose that even operators of the continuous rotary type of filter will have to pay the Moore Filter Co. royalty for some years to come. But, save where it is possible to mill with weak solutions, the mechanical loss of cyanide where no filter is employed, is bound to be high, amounting to over 24c. per ton in the most favorable cases. By using weak solution running 0.04% KCN, or less, as a diluent in the final thickener, and returning the effluent after precipitation to the battery storage-tank, mechanical loss of cyanide would be kept as low as possible, while by stamping in a weak cyanide solution through a coarse screen, and only bringing the solution up to full strength in the tube-mill circuit after return of the excess solution to storage, not only would the amount of solution requiring precipitation be considerably diminished, but the bulk of the metals could still be brought into solution ahead of the agitators. Yet neither the gold content of the battery solution nor the cyanide titration of the same solution when precipitated for use as a final diluent would show any tendency to climb. Such a scheme, requiring two classification circuits, would necessitate the employment of double the usual number of classifiers and also of an extra thickener.

The Field for Decantation

To sum up: in my opinion, the slime of many gold ores may be successfully treated by a combination of continuous decantation, with some form of continuous rotary filtration. A smaller proportion of ores will give good results with the same process, even after dispensing with a final filtration. On the other hand, most silver ores, and high-grade and fairly refractory ores, which require prolonged agitation, are best treated by filtration with a discontinuous filter of the leaf-type. Even then, however, it is advisable to remove the greater part of the precious content by preliminary thickening and dilution with barren solution. Though used in a large percentage of the latest mills in America and Mexico, like the Nissen stamp, the Dorr thickener has been slow to find much favor on the Rand. Again, like the Nissen stamp, it has been left for Rhodesia to be the first South African field to adopt these machines. The working of the thickeners at the Globe & Phoenix, and at the Shamva, will be watched with interest, and should they fulfil expectations, perhaps in a little while they will become as common on the Rand as vacuum-filters or Pachuca tanks. The Dorr machine will discharge a thickened slime containing as low as 40% moisture, but in continuous decantation it is not advisable to pull a slime containing less than 50% moisture, owing to the difficulty that might be experienced in obtaining a perfectly homogeneous mixture of the thickened slime and the added diluent. I have found it advisable to fit a jet of compressed air to the outlet in such a manner that, if it clogs, as it sometimes does when discharging a thick slime, the valve may be cleared. Needless to say, the air must be used with discretion, as the slime in the thickener is disturbed and tends to make the clear overflow muddy. In any case, it is advisable to run the overflow through some sort of clarifier, as in a plant where there are several thickeners it is easy for one to receive a little more slime that is drawn off from it. In course of time the thickener gets overloaded, and if it starts to overflow muddy at three o'clock in the morning, when the shiftman is busy somewhere else, that shiftman is out of a job, and the smelter has more mud than gold slime to smelt at the next clean-up. For this reason, not only should a sand-filter or clarifying-press be always employed, but it is advisable to fit each thickener near the top with a 3-ft. gauge-glass similar to those provided on boilers. Then it is an easy matter for the shiftman every time he passes to observe if the glass is clear or not, and if slime appears in the gauge to take the necessary measures to lower the slime-level of the thickener in question.

One other point: harpooning on night shift for a sack or other foreign body which has stuck in the outlet of a thickener, demands skill, patience, and luck. Therefore, it is as well to have the machines covered with ordinary wire netting. Sometimes one is troubled with an excess of foam or scum, which is often due to excess of alkalinity, and which tends to be carried over into the discharge launder and render the overflow muddy. A simple remedy is to withdraw every alternate bolt among those holding the inner rim of the iron overflow launder in place. This lowers the level of the solution a few inches, and while the clear overflow escapes through the bolt holes, the foam is kept back by the edge of the launder till it finally sinks because of its own weight.

Starting Mill Motors

By W. B. Lewis

*A recent inquiry leads me to cite a case of mill operation in which the motors are started synchronously with the turbine generator. When the plant is shut down at night, the turbine throttle is closed, and the turbine stops together with all the motors. In the morning an engine-driven exciter is started, and full excitation is applied to the turbine-generator field. The throttle of the turbine is then opened and all the motors start up with the generator. This method of operation has been used for six years, with practically no switches operated on the switchboard, not even the generator-field switch. The line-current never exceeds normal running current, and all mechanical and electrical strains on the system seem to have been reduced to a minimum. The method is particularly favorable in the case cited, as there are a number of 100-hp. squirrel-cage motors, the starting of which in the usual manner by means of an auto-starter would be troublesome.

*Abstract from *The Electric Journal.*

Discussion

Readers of the MINING AND SCIENTIFIC PRESS are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes the expression of views contrary to his own, believing that careful criticism is more valuable than casual compliment. Insertion of any contribution is determined by its probable interest to the readers of this journal.

Miami Costs

The Editor:

Sir—Your special correspondent in New York was mistaken when he said that the copper costs of the Miami Copper Co. are not given in detail. They are down to the third decimal place in cents. However, as you do not have them, I herewith enclose you a sheet showing the relative costs for 1911 and

MIAMI COPPER COMPANY

Tons ore treated—1911, 445,036 of 2.48% Cu; 1912, 1,040,744 of 2.39 per cent.

Concentrator production—1911, 16,195,561 lb.; 1912, 34,560,665.

Net smelter production—1911, 15,385,783 lb.; 1912, 32,832,609.

Extraction (net)—1911, 34.57 lb. per ton; 1912, 31.55.

SUMMARY OF COSTS

	1911.		1912.	
	Per ton.	Per lb.	Per ton.	Per lb.
Mining	$1.2134	$0.03500	$1.2032	$0.03813
Milling	0.6274	0.01810	0.6586	0.02087
General expense	0.2514	0.00714	0.1802	0.00577
Freight on concentrate	0.2174	0.00629	0.2173	0.00689
Smelting, refining, etc.	0.8041	0.02326	0.7323	0.02321
Selling	0.0591	0.00171	0.0405	0.00128
New York office	0.0605	0.00175	0.0386	0.00122
Total	$3.2333	$0.09325	$3.0707	$0.09739
Ag, Au, etc	0.0767	0.00222	0.0477	0.00151
Net cost	$3.1566	$0.09103	$3.0230	$0.09588

1912, together with the respective tonnages, grade of ore, and extraction. You will see that in 1912, on account of the high price of copper, we thought it desirable to treat certain ore of lower grade, and although the net cost was about one-half a cent higher, we received 3½c. more per pound.

J. PARKE CHANNING.

Miami, Arizona, April 14.

The State Mineralogist

The Editor:

Sir—I am today in receipt of your issue of February 1, and have read with interest the reports of the State Board of Control, and of the Board of Trustees, upon the administration of the Mining Bureau. Holding as I did the position of curator of the museum during the early spring and summer of 1912, I am in a position to know a little of the facts in the case, and when I read that "P. K. Swain and C. C. Selbie were successively employed as curators of the museum, but it is extremely difficult to ascertain what they accomplished in this position," and that "Neither one made any attempt to catalogue the exhibit," it occurs to me that further restraint on my part is neither necessary nor desirable.

In regard to the character of service rendered the bureau by Mr. Swain, I have no knowledge; he was not incumbent in that position when I took up the work, nor do I know during what period his services occurred. As to my own work, I was well prepared to undertake it at the start, and because I understood it and enjoyed it, I did it well. If the distinguished gentlemen of the Board of Control who found it so difficult to ascertain what had been accomplished, had shown me the courtesy of asking a personal statement in that regard, it would have given me the greatest pleasure to have furnished it, fully, and beyond a doubt to their entire satisfaction. There already existed, as stated in your published report of the Board of Trustees, a five-volume catalogue of the exhibit, and of this edition there were then on hand a large number of copies in the quarters of the Bureau, which it is difficult to believe could have escaped the attention of the Board of Control. This catalogue was, nevertheless, in great part antiquated, and inadequate to the present demands of the Bureau, and it was one of Mr. Storms' first suggestions, upon my taking up the work, that an immediate effort be made looking toward the re-cataloguing of the exhibit.

With this in view, and only after a careful and exhaustive examination of the entire collection by both Mr. Storms and myself, we were forced to the conclusion that any such attempt at re-cataloguing must be preceded by an entire rearrangement, not of the cases alone, but of the specimens themselves, this latter involving the redetermination of a great number and the relabeling of all, there being in the neighborhood of 25,000 all told. It will be at once apparent to those conversant with mineralogy that here was no slight task, and however congenial, it would call none the less for time and serious effort. In the short time that elapsed between my beginning work and July 29, when I left for Chosen, I had redetermined and labeled several thousand specimens in addition to meeting the regular routine demands upon my time, preparing mineral collections for the schools, determining and labeling new additions to exhibits, and disposing of the usually numerous inquiries, etc., to be expected by a curator in such a museum. As I said before, I liked the work, and so far from having had time upon my hands, it was seldom I found the time to complete what I had laid out; the hours were all too short.

Regarding other departments of the Bureau, I have little knowledge, with the exceptions of the chemical laboratory and the library. In the course of my work in the museum I had frequent occasion to visit both these departments, the former being in the charge of Mr. Preston, a Freiberg graduate; the latter in the charge of Mr. Bradley, a Berkeley man; both of them experienced mining men, and competent, efficient, and uniformly courteous in the discharge of their duties, which were numerous. As to Mr. Storms himself, I think there will be little doubt among the mining men of the Coast, to most of whom Mr. Storms is well known, as to the reasons contributing to his removal from office—no doubt that these reasons were purely political, and accurately described in statements given by him to this journal and to the San Francisco press.

CHAS. C. SELBIE.

KoSung, Korea, March 5.

Special Correspondence

NEW YORK

DULL MARKETS.—AMERICAN METAL BUILDING NEW ZINC SMELTER.—A. S. & R. AND GUGGENHEIM AFFAIRS.—POPE YEATMAN EXAMINING BRADEN.—BATOPILAS.

The week that ended April 19 was for the most part a cheerless one. In the matter of new enterprises there is little or nothing doing in the financial markets. The American Metal Co., Ltd., has completed plans for a new plant just west of Pittsburgh at Burgettstown, Pennsylvania. The plant, upon which construction is to be begun in the near future, is to have an initial capacity of 40,000 tons of sulphuric acid and 20,000 tons of spelter. The purchases of the company include 2500 acres of coal land, and 350 acres of land bought for the plant and for the homes of the people who will be employed. As fast as operations can be carried forward, the plant is to be increased to two or three times its first unit capacity. Present outlay amounts to about $2,000,000. The operations will be carried on by the American Zinc & Chemical Co., which is being organized as a subsidiary of the American Metal Co. H. L. Heinz, who was formerly connected with the Matthiessen & Hegeler Zinc Co. of Lasalle, Illinois, will be general manager for the new company and a member of the board of directors. The present plans of the company have been worked out by Mr. Heinz and Otto Sussmann, who has been chief engineer and metallurgist of the American Metal Co. for many years.

The A. S. & R. Co. and the American Smeltera Securities Co. have been under something of a sharp cross-fire during the week. Sidney Norman has been waging a vigorous campaign in behalf of minority stockholders in the Federal M. & S. Co., charging that the Federal was not receiving fair treatment. Mr. Norman's activities have caused the rumors of a federal investigation of the A. S. & R. Co. to be revamped and put into circulation. It is stated, though not officially affirmed, that agents of the federal Department of Justice are now engaged in gathering data, but that the work in this regard will not be completed for some months. In the meantime the affairs of the Guggenheim combination go merrily forward. Pope Yeatman and his staff of engineers are now in South America making a thorough examination of the Braden property, and a tremendously bullish report as to Braden's possibilities as a cheap producer is confidently anticipated. The production of Braden for the first quarter of the current year totaled 4,134,000 lb. of copper. The March output was 1,472,000 lb., produced from 53,700 tons of ore, which averaged 2.40% in copper. It is not the results that are now being attained that are of particular interest at this time, but rather Braden's possibilities as a large producer at a very low price. Mr. Yeatman's report will undoubtedly have something of interest as regards ore reserves, while some of the Braden people are being unofficially quoted as saying that even now Braden's output could be laid down in New York for 7c. per pound or less. As a matter of fact, up to the present time the copper has been shipped in blister form to Liverpool.

Convertible bonds of copper mining companies are evidently not in quite so high favor as formerly. Granby is listed on the New York Stock Exchange; a recent offering of the right to subscribe to the new bond issue brought out the fact that there was absolutely no bid whatever for the 'rights.' Granby has declared a dividend of 1½%, payable on June 2, and the Amalgamated a regular quarterly dividend of $1.50, payable on May 26. At the annual meeting of the New Baltic Copper Co., John C. Shields and John Merton were elected directors. The treasurer's statement shows a balance on hand of $23,576, the income during the year having been $1150. The anaual report of the Butte-Ballaklava Copper Co. shows a balance on hand of $118,787, receipts during the year of $151,560, and expenditures of $86,030. The suit of the Anaconda against the Butte-Ballaklava company is expected to come to trial in June. D. E. Woodbridge has made a report upon the vein system in controversy which is said to favor the Butte-Ballaklava, as it is said that exploratory drifts which have been driven within Anaconda ground have shown that the Mountain Chief vein continues down into the lower workings and is not faulted over into the Ballaklava ground, as claimed. The group of Butte people who have been behind Tuolumne and the Pilot Butte, are asking the public to come into another flotation known as the Butte Main Range Copper M. Co. As a sort of encouragement to possible investors, Pilot Butte has been given a little market impetus and the stock quoted as high as $15, giving holders a very handsome paper profit, most of the stock having been put out at $10. A receiver has just been appointed for the Tuscarora-Nevada Mines Co, a $12,000,000 corporation, a promotion in copper mines which 'died a bornin'.'

The Batopilas Mining Co. is to be reorganized. The company's capitalization of $9,000,000 is to be cut in half, probably by a reduction of the par value from $20 to $10. The English company of the same name is to be wound up as soon as possible. The annual meeting was held this week in New York. The preliminary report of operations showed net profits of $81,202, as against a deficit of $17,409 in 1911. During the first quarter of the current year, the company produced 161,000 oz. of silver. During the past 18 months the company has been shipping its product to Liverpool.

LONDON

SAN FRANCISCO DEL ORO.—KNOX & ALLEN REPORT FAVORABLY.—NEW ARRANGEMENTS MADE FOR WORKING THE PROPERTY.

For ten years the San Francisco del Oro mine at Parral, Chihuahua, Mexico, has provided many texts for disquisitions on direction and management. The mine was worked by local owners for some years at a handsome profit, for the oxidized lead ores were rich in silver, and were acceptable to the smelters. When the sulphide zone was reached, and blende made its appearance in large quantities, the property was sold to Englishmen, who presumably had not sufficient knowledge of concentration and smelting to enable them to determine correctly the value of their purchase. Anyway, the original prospectus contained an analysis of the ore, with the lead, zinc, copper, silver, and gold contents separately valued and added together so as to obtain the total value of the ore. This method of fixing the value of the ore was adopted through "sheer ignorance," as Dr. Samuel Johnson once said in explanation of an error in his dictionary. It was not done of malice prepense, as was the case in connection with one of the 'patent' smelting nostrums for the treatment of similar ore at Broken Hill at about the same time. For many years the San Francisco del Oro company perpetuated its existence by picking the best leady ores and selling them to the smelter, but no profit was ever made. Reconstruction was necessary three years ago, and at the meeting of shareholders then held, a director repeated the heresy of ore valuation. But last year it was recognized that this could not go on forever, and expert advice was obtained, Knox & Allen of New York being retained. Their report on the mine was favorable, and they also indicated that with modifications the present dressing plant could be utilized. A large amount of additional capital has been subscribed, by a combination of groups, A. Goerz & Co., the South African firm, which has also an office in Mexico, being the leaders. Knox & Allen report that the San Francisco vein is a persistent fissure lode in limestone. Below the third level the ore consists of sulphides. The ore reserve above the fourth level is estimated at 140,000 metric tons, and the expected ore between the fourth and fifth levels is given as 250,000 tons. The geological formation and the indications are such as to warrant the hope of a further 500,000 tons. The ore at present known averages 12½% lead, 17.4% zinc, 21 oz. silver, and 1.4 dwt. gold. The concentrating plant, consisting of jigs and tables, has a capacity of 200 tons per day. Eventually it is to be extended so as to have a capacity of 300 tons per day. When the alterations have been made, it is expected to produce a lead con-

centrate averaging 55% lead, 8% zinc, 60 oz. silver, and 4½ dwt. gold, which is salable to lead smelters; and also a zinc concentrate averaging 37% zinc, 8% lead, 22 oz. silver, and 1½ dwt. gold, which is to be roasted and shipped to the works of the Hydraulic Power & Smelting Co. in Norway, where it will be treated in an electric furnace. This smelting company owns the plant at the Trollhättan falls in Sweden and is building others in Norway. The smelting is done electrically, and details of the venture were contained in several issues of *The Mining Magazine* a year or so ago. The adoption of this method of disposing of the zinc concentrate proves the continued influence of some of the old controllers. The concentration problem at the mine is complicated by the presence of calcite and fluorite, two minerals that make flotation methods impossible. Calcite is wasteful of acid, and fluorite has an inconvenient habit of floating with the blende.

BUTTE, MONTANA

BUTTE CENTRAL.—CORBIN COPPER AND NATURE LOVERS.—BARNES-KING.—TUOLUMNE.—FORGED PAY-CHECKS.—REVIVING PLACERS.

If the Butte Central Copper Co. is as abused and misunderstood as its sponsors keep asseverating, it is time that some effort be made to put the rascals down. Why wouldn't it be wise for Butte Central to employ a competent mine-valuer from distant parts to find out about that one and one-half million tons? Loud plaints and innuendos seem to be convincing no one, as the stock is still in the dumps. The only definite evidence so far is that from Mr. Treloar's report, to the effect that the one and one-half million tons of commercial ore is conspicuous by its absence. Those who know seem to be all agreed that the mill is well put up, and of good design, but the country is already strewn with serviceable mills with nothing to treat. Everyone hopes that Butte Central will come out of this with flying colors, but up to the present Mr. Treloar's 400 or more samples are more convincing than the occasional sample of a stockholder or a chance visitor underground, or even than the sampling of the mine management. The general declaration that so and so, the well known, etc., spent the day inspecting the mine and was very much pleased with conditions, means absolutely nothing, as you can't value Butte silver ore by walking through the mine drifts.

The Corbin Copper Co. is having trouble getting started on the Gambrinus property in Butte. The ground is situated in a residence section of the city, and property-owners are protesting against having a mine in their back yards. But why be so sensitive! W. A. Clark has one in his back yard, operating, too, and Butte never can get up much of a reputation for looks anyway. Of course, we can't all be like Mr. Clark and go to our New York, Los Angeles, or Paris homes if we don't like the turmoil at Butte. But, after all, if it wasn't for her mines, the site of Butte would be a nice little bit of mountain scenery, which would be conspicuously free of humanity. Harry B. Byrne, of Paine, Webber & Co., has been elected a director of the Corbin company.

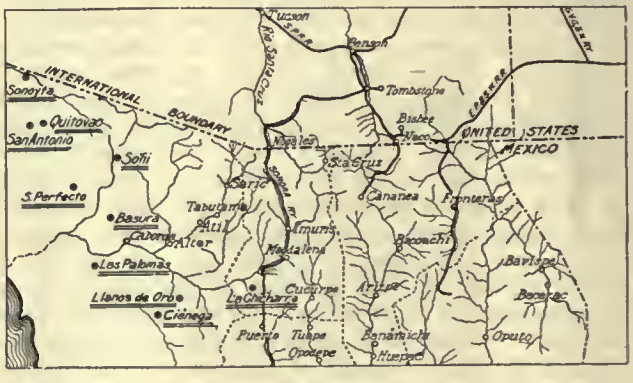
The outlook for the Barnes-King Development Co. continues promising. The March output from the North Moccasin property was 3870 tons, yielding $8.40 per ton. Although work has been temporarily suspended in the Piegan-Gloster mine at Marysville, prospects there are fairly good and will justify a continuation of development, now that an extension of six months has been granted on the final $70,000 of the purchase price. The shaft of the Tuolumne Copper Co. has reached the 2200-ft. level, a station has been cut and drifts started. Good copper glance and bornite ore has already been opened on this level.

What might have caused a serious loss to Butte business men was nipped in the bud last week when it was discovered that the pay-checks of the Anaconda Copper Mining Co. had been forged. The criminals were so eager for returns that they began cashing the checks with merchants on Friday, and a bank teller recognized the fraud. Had they waited until after banking hours Saturday, a big haul could have been made, as Butte merchants have always cashed the mining company checks without question. That the much-vaunted pioneer placer miner occasionally overlooked a good thing has recently been proved in the Highland diggings south of Butte. A stampede for Highland gulch occurred in the '60s, and it was thought that the cream had been skimmed long since, but recently some rich finds have been made there, and the old camp of Highland is beginning to show signs of renewed activity.

CANANEA, MEXICO

MINES CLOSING AND TRANSPORTATION DISORGANIZED.—CONDITIONS AT CANANEA.—EXPORTS THROUGH AGUA PRIETA.—STATE REVOLUTION SUCCEEDING.

With the present revolution throughout Sonora against the Diaz-Huerta government, mining has been given a setback which will probably prove to be more serious than any experienced heretofore. There is no train service to speak of, except on the line between Douglas, Arizona, and Nacozari; labor is scarce in many quarters, especially in the smaller camps, while in many districts the mining business is at a standstill. The latter condition is to be noted principally in the central and southern portions of the state. During the past ten months a number of mining companies have resumed operations after a period of idleness extending through several years in some instances, and just before the present revolution a number had begun work after spending large sums in cleaning up their properties and installing machinery, only to be forced to close in a short time. It appears that it may be some time



NORTHERN SONORA.

before conditions are normal, and many of the properties will remain idle until that time. The Southern Pacific Railroad of Mexico, which traverses the entire state, has been practically idle for almost two months, the only trains operated being those run by the state, which has appropriated a portion of the company's rolling stock and is using it to transport troops. For this reason no supplies can be secured by companies in the interior dependent upon this line.

In Cananea conditions were not so bad up to this week, although only two properties are operating to any extent—the Cananea Consolidated Copper Co. (Greene-Cananea) and the Moctezuma-Arizpe Development Co. (Mexican Metals). The Democrata Mining Co. is doing a small amount of necessary work, while the Calumet & Sonora is operating on about the same scale. Only 42 carloads of fuel oil have been received in Cananea since the trains stopped running, on March 9, and these were brought in through courtesy of both federal and state armies prior to the battle at Naco and after the fight in Cananea. Whether the Southern Pacific will operate trains soon is problematical, as the officials first demand the return of their rolling stock now held and used by the state. Notwithstanding the battles and accompanying disorders, the Cananea company has been operating steadily throughout the period of unrest, and, although not on a normal scale by any means, is now making between 60 and 70 tons of blister copper per day. During March the smelter output (gross) was 7,200,000 lb. Only a few of the company's mines are being operated, those which ship direct to the smelter, while those shipping to the concentrator have been

idle for several weeks. The concentrator is closed, but repair work is being done in order to give some of the unemployed men employment. The reverberatory furnaces and McDougall roasters are also down, and it will probably be some time before they are in operation. The smelter is operating at present with four of the eight furnaces and two converters. It will be at least two months before everything is running normally again.

A good barometer of conditions in the northeastern portion of the state is the exportation of mineral through the custom house at Agua Prieta. March exports showed considerable loss compared with February. The total value of mineral shipped to the United States during February was $1,086,550, while that for March was $881,150, a difference of $205,400. In that portion of the state several properties have closed, but there are a few larger concerns continuing, such as the Moctezuma company at Nacozari, and El Tigre. The Transvaal Copper Co., near Cumpas, has closed completely, and the Minneapolis Copper Co. has done likewise. Both of these had resumed operation but a short time previously. The Gueriguito silver property (W. L. Humphrey, manager), about 35 miles south of Nacozari, has closed its mill, while a number of smaller properties in that neighborhood are also idle. The Ormus mine, near Cumpas, has continued in operation continuously. The Colorado mine (Frank Lintner, manager), near Huepac, will soon resume operation, Mr. Lintner leaving Cananea for the property this week. The Washington mine, close by, will also resume, F. O. Bostwick now being at the property. A hoist will be installed at once. La Cobriza company, whose property is 17 miles northwest of Noria (F. C. Emery, president), has closed some time ago, early in the revolution. It only recently blew in its smelter, which was installed two years ago but never used on account of the unsettled conditions accompanying the Madero revolution. San Geronimo (El Tajo) mine, near Carbo, has also closed. At present it appears as if the state revolution against the central government will be successful, and when this is ended it is expected that mining will again resume its normal condition, and that all properties which have been forced to close during the past two months will soon resume.

MIAMI, ARIZONA

FALLING CAPPING CAUSES AIR-BLAST.—THREE MEN KILLED AND SEVEN INJURED.—TOO MUCH ROOF FALLS AT ONE TIME.

At the Miami Copper Co.'s mine, on the morning of April 17, a disastrous cave-in occurred on the 245-ft. level. Three men were killed, seven seriously injured, and a large number suffered minor injuries. The cave-in was in what is known as the northwest portion of the mine, lying about 300 ft. northwest of the main shaft. The shrinkage-stope method of mining which is being carried on in this portion of the property necessitates that the overlying capping be undermined and allowed to gradually settle, coming to rest on the broken ore beneath. In accordance with this method, three chambers on the 245-ft. level had been broken up to the capping. The first of these chambers lay to the south, 90 ft. wide and 150 ft. long, and was partly filled with ore. Adjacent and running north lay the second, 75 ft. wide and 160 ft. long, while the third lay to the west and had a width of 50 ft. and a length of 300 ft. Like the first, it was partly filled with broken ore. Below these, at a depth of 125 ft. on the 370-ft. level, commences the three shrinkage stopes, No. 500, 600, and 700, these also being partly filled with ore. In the past the capping has always settled without any accompanying bad results, but for some unforeseen reason, the nature of which is at present unascertainable, the entire capping overlying these chambers and stopes suddenly gave way, breaking through to the surface. The capping at this point varies from 250 to 300 ft. in thickness; corresponding to a weight approximating 3,000,000 tons. This enormous descending mass of earth carried away the intervening block of ore lying between the 245-ft. level and the underlying shrinkage stopes, completely filling these rooms and expelling the air at a terrific velocity. The blast of air traveled through the many drifts of the lower levels at a rapid rate of speed and was the direct cause of all the casualties. Men were hurled 40 and 50 ft. The caved portion gave sufficient warning of its approach, and all men in this vicinity were removed from the danger zone. This accident will in no way interfere with the effectiveness of the shrinkage stopes as the result obtained was the one the company intended to eventually secure. The capping in all parts of the mine is now down to the broken ore, and there is absolutely no chance of a repetition of the disaster. Mine operations in other parts of the mine were not interfered with, but it is probable that the mill tonnage will be slightly cut down during the following week.

Operations at the Miami have not been affected by the temporary disturbance at Cananea, as an ample supply of cars for the storage of the concentrate is available. If the difficulties at Cananea continue, it is said that the ore will be shipped to the I. S. & R. plant in Utah. It is reported from New York that holders of the 6% Miami bonds, of which $1,500,000 were issued, have exchanged them all for stock, with the exception of $26,000. The bonds are convertible into stock at $17. Of the 800,000 shares authorized, 745,541 have now been issued.

BRITISH COLUMBIA

DIVIDENDS AND DEVELOPMENT THROUGHOUT THE PROVINCE.—BRITANNIA UNHURT BY STRIKE.

Dividend payments in 1913 to the middle of April by metalliferous mining companies have reached a total of approximately $573,756, in the following proportions: British Columbia Copper Co., one distribution of 15c. per share (April dividend has been passed), $88,756; Granby Consolidated, one of 1½%, $225,000; Hedley Gold Mining Co., one of 3% and 2% bonus, together $60,000; and Standard Silver-Lead Mining Co., four of 2½% each, $200,000. In the East Kootenay district shipments of lead ore from the Sullivan mine to Trail for three months have been about 10,000 tons; output of St. Eugene mine for the same period has been only 363 tons. Both mines are operated by the Consolidated M. & S. Co. Recently published figures show production of Monarch concentrator near Field, Northeast Kootenay, in 1912 to have been 1855 tons of lead concentrate, net recovery from which was 1125 tons of lead and 7405 oz. of silver; also 185 tons of zinc concentrate, containing approximately 72 tons of spelter. At Ainsworth, No. 1 and Silver Hoard mines have been worked during the winter; both have shipped silver ore to Trail, but conditions have been unfavorable to production, so the output has been comparatively small. The Bluebell, situated across Kootenay lake from the town of Ainsworth, which concentrates its lead ore about 6 into 1, shipped to Trail in three months approximately 2500 tons of concentrate. At Slocan, Retallack and Co. (Whitewater group), Lucky Jim, Rambler-Cariboo, Slocan Star, Richmond-Eureka, Ruth-Hope, and several others have been worked during winter, but deep snow has interfered with the output of ore. Near Silverton, the Standard has been the largest producer, with an output for the quarter of nearly 4000 tons of sorted silver-lead ore and concentrate, besides zinc concentrate. Both the Van-Roi and Hewitt, in the same camp, were also continuously operated. At Nelson, near Kootenay river, the Molly Gibson, Queen Victoria, Eureka, and Granite-Poorman were the chief operating mines. At Ymir, the Wilcox and Dundee continued development, while the Yankee Girl to the end of March shipped about 1300 tons of ore to Trail. The H. B. and Emerald lead mines near Salmo, the Motherlode and Queen gold mines and stamp-mills in Sheep Creek camp, and the Arlington and Second Relief, in Erie camp, were all worked, and shipped more or less ore or concentrate. At Rossland, the Consolidated company's Centre Star-War Eagle group and Le Roi mine, and the Le Roi No. 2 Ltd.'s Josie mine were producers. The total output of the first-mentioned company's Rossland mines during three months was about 52,000 tons; the latter company shipped to

Trail nearly 6000 tons, chiefly crude gold-copper ore, and milled between 4000 and 5000 tons of second-class ore. In the Boundary district the Granby company's output for the quarter was about 306,000 tons of ore, from which was recovered nearly 5,590,000 lb. of copper and small value in gold and silver. British Columbia Copper Co. smelted 82,000 tons of ore from its Mother Lode mine, 63,000 tons from the New Dominion Copper Co.'s Rawhide mine, 7000 tons from its Queen Victoria mine (Nelson), and 10,500 tons from several smaller mines. Other mining operations in the district were unimportant. In the Similkameen, the only noteworthy mining was that of the Hedley Gold Mining Co., which mines and mills about 6000 tons of gold ore per month and recovers on an average $11 per ton.

The Britannia Mining & Smelting Co., operating a copper mine on Britannia mountain, Howe sound, within 30 miles by water of Vancouver, does not appear to have any serious difficulty in continuing its work, for about Easter time it had approximately 600 men at work, all told, and operations were in progress in all departments. Miners' union officials have caused to be published in provincial newspapers statements to the effect that 700 men had struck work; as a matter of fact, less than half that number went out. When the property was visited at Easter time it was found that mining and extraction of ore was being carried on up at the mine, although the mine crew was 30 or 40 men short of the full number; the long aerial tramway from the mine down to the concentrating mill at Britannia Beach was being used for the conveyance of ore, some 500 tons of which was being sent over it daily; the work of driving the long low-level adit—then in more than 3600 ft. and with 1400 ft. more to be driven before the 1200-ft. raise to the 1050-ft. level of the mine workings above will be commenced—was being continued with two shifts of men; three-room houses for the accommodation of married men were being built near the portal of the adit, with a dozen houses already erected and ground cleared for more; large new bunk and boarding houses were occupied, and power-house and machine-shop were being equipped with much machinery and plant; grading for the railway from the adit to the top of a long incline to be made for transportation between adit and mill was well advanced; construction of new power-house at Britannia Beach was nearly completed, and the erection of the building for the Minerals Separation plant was well forward; erection at the Beach of more houses for married employees was being vigorously proceeded with; a large new store was about finished; dock, bunker, and other shipping facilities were being added to; railway connections from mill to shipping docks were being improved; the concentrating mill was treating 500 tons of ore per day, and provision was being made for increase to 600 tons; and generally, operations were being carried on with comparatively little inconvenience, and with good prospects of shortly having full working forces in all departments. The company has stated most positively it will not recognize the union, but will in the future, as it has done in the past, pay good workmen the best wages obtainable at similar work elsewhere on the coast; will give them good food and accommodation, with all reasonable provision for their health, comfort, and recreation, and will provide permanent employment for all its employees so long as they shall do a fair day's work for their pay and otherwise conform to the reasonable rules under which they accept employment here.

COBALT, ONTARIO

La Rose, Little Nipissing, and Other Mines.—The Eight-Hour Day Legislation Likely to Pass.

The market for the silver issues has lately been dull and declining. The annual report of La Rose is of discouraging character, showing a marked falling off in ore reserves, which at the end of 1912 were estimated at 2,796,650 oz., as compared with 4,250,861 oz. in 1911. Production was decreased, the output being 2,816,597 oz., of the value of $1,603,969, as compared with 3,691,797 oz., valued at $1,810,470. The surplus, after paying $936,641 in dividends, was $1,578,592. The Little Nipissing, which has been unfortunate from the start, will in all probability be wound up, as the holders of a mortgage against the property for $21,000 have taken foreclosure proceedings. The Gould Consolidated will also have to go into liquidation unless the funds to settle obligations amounting to $8000 are shortly forthcoming, of which there seems to be no likelihood. Persons who want to secure a controlling interest in Peterson Lake are offering the stockholders 43c. per share for their holdings. The strike at the Beaver has been amicably settled, and the mine and mill are working after being closed down for eight days. The Belmont, which had been shut down for two years, has been reopened. Work has also been resumed at the Twentieth Century, the plant which was burned some months ago having been replaced. The Drummond is reported to have been sold for about $500,000 to men whose names have not been made public. The Cobalt Lake has declared another 2½% dividend, with an additional ½% bonus. The Mann of Gowganda Lake has shipped 20 tons of high-grade ore running about 3000 oz. per ton. The Keeley mine, South Lorrain, has been sold by the receiver of the Farmer's Bank under a working option for a year to an English syndicate. The bill providing for an eight-hour day for the miners on April 9 received its second reading in the legislature by a unanimous vote, which is regarded as practically insuring its adoption. It was strongly opposed by the mine-owners. Some modifications in the measure were made; iron mines, which were expected in the draft, will be included in its provisions, with a clause to the effect that the Government might exempt an iron mine from the operation of the bill if it were shown to be sanitary and healthful.

BOSTON

Reorganization of Dow Companies.—Cheerful Reports from Chino, Old Dominion, and Ray.—Annual Meetings.

The annual meetings of the Edwards, formerly the Dow, copper companies have all been held in Boston, and it appears that these companies, the Corbin, Algomah, Franklin, North Lake, and Indiana are to be re-established in public confidence without delay. It was decided to exonerate all Dow's associates except Alvin R. Bailey and to leave the matter of prosecuting Dow and Bailey to the new directors. These properties now have important Stock Exchange and copper interests identified with them and their restoration to public confidence should be complete. The United States S. M. & R. Co. has also become associated with the active direction of the Lake companies mentioned and it is assumed that this connection will be extended to the Corbin company, which is making valiant efforts to recoup itself by taking over a promising prospect in the heart of Butte, where a deep shaft is to be sunk. According to W. F. Bartholomew, who with E. N. Skinner has been visiting the Chino, that mine may be worked by steam-shovels for 20 years, and that two out of seven shovels in commission can supply the necessary tonnage for a production of 5,000,000 lb. of copper per month. Ore reserves are now placed at 94,000,000 tons and no disappointments in tonnage extraction or costs have been recorded. At Globe, Mr. Bartholomew found the Old Dominion making a most excellent showing with underground developments never better. The sixteenth, the lowest level, shows a wider orebody both east and west than was found on the fourteenth, and the ore reserves are larger than ever before. He figures that Old Dominion will show earnings this year of at least $2,000,000 net. He wired from Phoenix that Ray Consolidated looks good, is opening fast, has 54 miles of underground openings, and is taking out 6700 tons of ore per day. The second week in April was characterized by the annual meetings of 16 mining companies in Boston and other points, these being Algomah, Batopilas, Corbin, Chino, Ray, Nevada Consolidated, Nevada-Douglas, Miami, New Baltic, Houghton, Franklin, Bingham, Bohemia, Indiana, North Lake, and Utah Consolidated. Calumet & Arizona's meeting was postponed.

General Mining News

ALASKA

Fairbanks

Eighteen tons of ore from the Homestake mine, on Wolf creek, yielded $70 per ton during the last week of March. The adit is now in 250 ft., opening an 11-in. vein. To enable sinking to be done on the Newsboy claim, $6600 out of $15,000 required has been collected by shareholders. The 'camp' at Ruby is quiet at present, but sluicing will be begun as soon as water is available.

Juneau

During March the Alaska Treadwell company's 240 and 300-stamp mills worked 10.45 and 20.24 days, with water and steam-power, and 9.90 and 15.22 days with water and electric power, respectively, crushing a total of 69,944 tons. The yield from amalgamation was $90,375, and from cyanidation of 1385 tons of concentrate $76,481, the total realizable value being $165,187. Operating expenses were $85,806, and construction $6216, leaving a profit of $73,165. Development covered 621 ft., and the stock of broken ore increased 2172 tons.

ARIZONA

Gila County

(Special Correspondence.)—The number of underground employees of the Inspiration Consolidated mines is being increased, a noticeable feature being the preference given to Americans over foreigners.

Miami, April 12.

Greenlee County

The Arizona Copper Co., Clifton, will add 30 motors, ranging from 3 to 125-hp., to the electrical equipment in its mines. The motors have been ordered from the General Electric Company.

Mohave County

(Special Correspondence.)—The Gold Road Mining Co. shipped during the past week $28,000 of gold bullion, the result of a week's clean-up. The stopes in the old workings have been cleaned of low-grade ore, and with the new orebody and the better grade found on the 500-ft. level, it is expected that the mill will produce $200,000 per month. The shaft at the Sonoma mine, at Chloride, is down to a depth of 115 ft., and the drift has opened 4 ft. of shipping ore, a carload sent to the smelter at El Paso giving satisfactory results. As soon as stopes can be opened on the 115-ft. level, regular shipments will be made. This is one of a number of old mines and prospects on Silver hill, at Chloride, that have been idle for years. Ed. Williams and wife have sold their ranch on the Lower Sandy and invested the money in tungsten claims at Williams Springs in the Aquaisus range. A treatment plant is to be erected on the property, and concentrate will be sent to Eastern ore-buyers.

Kingman, April 17.

Santa Cruz County

(Special Correspondence.)—Gold and copper ore has been found in the 200-ft. adit of the Copper Queen Co.'s property in the Harshaw district, near here. The rich orebody was found in the upper adit, which has over 800 ft. of backs, and it is expected that the vein will be reached within 100 ft. more of work in the lower adit.

Patagonia, April 17.

CALIFORNIA

California oil companies paid $1,580,344 in dividends during March, the largest amount ever paid in any month. Of the total, the Standard Oil of California paid $1,123,349; Union Oil Co., $184,743; Amalgamated Oil Co., $50,000; United Petroleum Oil Co., $48,450; and American Petroleum Co., $52,040.

Amador County

Some time ago a vein was opened on the 1800-ft. level of the Oneida mine, Sutter Creek, and during the past week rich ore was opened in the South Eureka mine, which is believed to be a continuation of the Oneida shoot.

Eldorado County

The Beebe mine at Georgetown is being unwatered, after being shut down for three months. The shaft is down 200 ft., and 100 ft. of cross-cutting has been done.

Mono County

The annual meeting of the New Bodie Mining Co. and the Field of Gold Mining Co., known as the Loose companies, whose properties are at Bodie, was held at Provo, Utah, on April 8. Little work is being done, except some leasing.

Nevada County

The mining claims at You Bet, owned by the late J. S. Goodwin and Nicholls Bros., are to be bonded to Los Angeles people, if permission is granted by the Court.

Shasta County

After being shut down for over a year, the Mammoth Copper Co. has eight men pumping out and repairing the Original quartz mine near Whitehouse. This mine is under lease to the company, which contracts to mine 15,000 tons of low-grade flux per annum, containing a little gold, for the Kennett smelter.

Sierra County

The adit at the Kirkpatrick placer property, near the Mountain House, is in 800 ft. in hard rock, and 100 ft. per month can be driven with seven men. Rich specimens of gold-bearing arsenical pyrite and other ore from the Ironsides mine has been on show at Downieville. The Gold Bluff North Fork ditch has been repaired, and the Middle Fork ditch will also be done as weather permits.

Trinity County

The Trinity Gold Mining & Reduction Co. has mines and works in Trinity county, California, and the report

MAP OF TRINITY COUNTY.

for the year that ended on November 30, 1912, has just been issued. The report of the president, H. W. Miller, states that during the year the company's indebtedness was reduced from $154,392 to $75,042, and the current assets at the end of 1912 were $50,976. It is proposed to dispose of the 40,780 shares of treasury stock and apply the proceeds to the debt. The amount of cash on hand is $14,402. Net earnings for the period amounted to $38,533, which, added to the previous surplus of $66,264, made a total of $104,797. The orebody in the mine may be described as a fairly flat shoot 40 ft. thick, as disclosed by outcrops and mountain slides. Previous development work consisted of clearing away overburden from an area of three to four acres, extending the upper adits under the vein, and raising and sinking at various points. Several examinations were made by engineers, tests made on the ore, and it was thought that the vein was a continuous shoot of profitable value, but mining operations during

the first half of 1912 proved otherwise, and the plant was closed. Adits had disclosed ore 72, 90, and 55 ft. thick, the distances between raises being 80 to 100 ft., and it was concluded that it was all payable ore, but gold only lasted for a few feet in depth. In another part of the property a mountain slide had exposed 40 ft. of ore, and overburden was removed by hydraulicking. Assays taken at frequent intervals proved good ore, but further mining revealed that the ore was barely 10 ft. thick. Later work, several hundred feet from the ore referred to, has opened 100,000 tons of sulphide ore containing $4.50 per ton in gold, 30c. in silver, and 0.5 to 2% copper, more continuous than any opened in the property. Owing to the winter, work was stopped in January 1913, and in the spring it is proposed that the mine be thoroughly examined. The mill is not adapted to treating the sulphide ore and must be altered.

The general manager, D. W. Shanks, reported that large dikes of disintegrated porphyry, not showing on the surface or cut by raises, caused the loss of ore reserves mentioned in the president's report. A system of drill-holes was laid out around the uncovered ore, about 100 ft. from the stripped ground, and the sulphide ore referred to was cut. Up to August 1, 1912, the mill treated 47,600 tons of ore worth $4.36 per ton, with a recovery of 81.88%. Mining costs were $1.43 and milling $1.01 per ton. A report dated March 27, 1913, states that the cross-cut from the lower adit has been driven 200 ft., and a raise has opened sulphide ore 40 ft. long, 20 ft. high, and 8 ft. wide. Samples returned from $8 to $34 per ton in gold and silver, and 1 to 3% copper, a drill-hole having passed through 6 ft. of $33.97 ore. On either side of the sulphide ore is a zone of mineralized schist worth $1 to $5 in gold and silver, with a little copper. At present, prospects are encouraging and extensive development is justified.

Tuolumne County

(Special Correspondence.)—Five men are employed in development work at the mine on the Barendregt ranch, north of Jamestown, recently bonded to a Japanese company, and grading is in progress for a steam-hoist. The 10-stamp mill on the Karnac mine has been purchased for the property, but will not be put up for some time. The shaft has been sunk to a depth of 100 ft., and until the hoist is placed driving only will be done. Clint Manley, of Jamestown, is in charge of operations. The Mountain Lily mine and a group of surrounding claims, situated above Columbia, have been taken under bond by John Lieber, and it is reported that development on an extensive scale is to begin soon. It is understood the group of properties is to be developed as one claim. A shaft 100 ft. deep and a drift 50 ft. long at the Morning Glory mine, near Confidence, has exposed a 3-ft. vein of good milling ore, with a streak of ribboned quartz several inches wide that is remarkably rich. The owners, C. F. and A. J. Layman, E. W. Burley, and W. S. Bingham, encouraged by the outlook, propose to push development with an increased force in the spring. The old Carlin mine, situated near the Harvard, a mile out from Jamestown, has been bonded to the Jamestown Exploration Co., and the property is being reopened for further development. Work will be directed by J. P. Mangante. The price to be paid for the property is $25,000, of which $5000 is to be paid in six months from date of option and balance in one year. The mine has produced upward of $50,000 and is considered a promising property. Sinking has been resumed at the Longfellow mine, at Big Oak Flat, and ore is being extracted from the 600-ft. level. Three machine-drills, an electric motor, and 1300 ft. of steel cable have lately been purchased by the new company. A. H. Prentice, now in charge of operations at the If I Can mine, has 30 men employed in the development of the property. The Philbert Gold Mining Co., of which George H. Walker is president, is steadily prosecuting development work at the Sunnyside mine, south of Tuolumne. The Sonnet mine, on Grant ridge, above Columbia, has been bonded to John Greenhalt, and development work is soon to begin.

Sonora, April 19.

COLORADO

Clear Creek County

Shareholders in the Waldorf Consolidated Mining Co. are being asked to pay an assessment of 3c. per share to save the property, which some time ago was bought in by bondholders under foreclosure. The treasurer, Mr. Wilcox, at considerable sacrifice, has advanced the company about $70,000 and endorsed about $40,000 of the company's scrip, so it is up to shareholders to help him out.

Lake County (Leadville)

At this time of the year there is always trouble in hauling ore to the railroads and smelter from mines not connected by rail, on account of bad roads. The Stars Consolidated Mines Co. is not shipping zinc ore at present, but iron ore totals about 4000 tons per month. The new mill in California gulch will receive all classes of ore for treatment when completed. The Sutton-Steele concentration process will be installed. The county has been presented with a bill for $1224 for capturing and bringing back from New York the alleged 'high-graders,' who were supposed to have stolen $100,000 worth of ore early in January.

Teller County (Cripple Creek)

During March the El Paso mine yielded 141 cars of ore, while the current month is expected to produce 156 cars. A 4-drill air-compressor has been installed on the Ocean Wave claim, Battle mountain. The Yellow Bird Leasing Co. has leased the Yellow Bird mine, south of the town, for three years. At the Independence mine the company is operating 9 and lessees 20 to 25 machine drills. The lessees ship about 750 tons per month. Water now stands at 1180 ft. below the collar of the shaft and recedes nearly 4 in. per day.

The Roxana Gold Mining Co. is suing the Doctor-Jack Pot Mining Co. for alleged wrongful extraction of ore from the former's mine. It is believed that the trial will be heard in the United States District Court. The Rapp lease at the C. K. & N. mine, on Beacon hill, employs four machines in development and one on ore. A shipment from the new ore-shoot proved it to be of good grade.

IDAHO

Shoshone County

About 6000 ft. of development, costing $52,000, has been done in the Silver Cable mine, and in the drift from the main adit a well defined vein containing talc and galena is being followed. It is expected that the vein will be reached within 50 to 75 ft. The new 200-ton mill of the Interstate-Callahan company, in the Sunset Peak district, has been started.

The Tamarack & Custer Consolidated Mining Co., operating the Tamarack, Chesapeake, and Custer mines, shipped 700 tons of ore and concentrate in March, and the current month's output is expected to be larger. The Black Bear mine, in Canyon creek, has a large amount of ore developed by its 6500 ft. of work done. A 100-ton mill is under consideration.

Leasing in the Coeur d'Alene has never prevailed to the extent it has in some of the high-grade Nevada, Cripple Creek, and Clear Creek districts and in many other of the old and new silver and gold 'camps' of the West. Such leasing as is done here usually is of old workings, where individual miners take a chance of making money and the peculiar conditions prohibit company profit and often involve the opening of new ground. At the present time there are extensive operations under the leasing system. Some of the lessees are making money, according to accepted report, notably those in the old Tyler workings above the Bunker Hill at Wardner, the 'McBride lease,' and that the lease on the old Sierra Nevada, farther over the hill from Wardner, known as the D. W. Peeples lease. Besides these, there are lessees at the Stewart, Bunker Hill, Crown Point, Yankee Boy, and Monarch.

MICHIGAN

Dickinson County

The Oliver Iron Mining Co., of Duluth, Minnesota, has arranged to add to the electrical equipment in its power-

plant, at Iron Mountain, two 2205-kva. alternating-current generators with 50-kw. exciter, and two 2000-kva. and three 875-kva. transformers. The order for this apparatus has been placed with the General Electric Company.

MISSOURI

St. Francois County

The fight begun at St. Louis by Robert Holmes and associates against the St. Joseph Lead Co., and Dwight A. Jones, the president, has been transferred to New York.

MONTANA

Granite County

The Makeever interests are spending more money in the Royal Basin mine, and the manager, J. D. Fields, has recently ordered machinery costing $65,000 from a Butte firm. This mine has been profitably worked for three years, and 100 men are employed. A shaft has been sunk 1000 ft. on the copper vein, and levels opened at regular intervals. The leaching plant is to be increased from 520 to 750 tons capacity, and a transmission line to carry 750 hp. from Philipsburg is being constructed.

Madison County

The placer ground in Alder gulch is being examined by Chas. Helman of Oroville and W. B. McCubbin of San Francisco, who have 700 acres in this district. A drilling machine is being shipped, and the ground will be thoroughly tested. Arrangements have been made to treat 500 tons of ore per month from the Arbor Day mine at the Easton-Pacific mill.

Silverbow County

The wages agreement at Butte is that, when copper is 17c., or over, per pound, the rate shall be $4 per day; below 17c., $3.75; and below 15c., $3.50. The price of copper having fallen below 15c. in March, the miners have been paid $3.50 per shift. Until smaller companies reduced the wages, the Anaconda company was not disposed to take action. It is stated that at the Washoe smelter a new method of leaching copper from the concentrator tailing has been devised, in which the sulphuric acid consumed in dissolving the copper is to be regenerated.

A station has been cut on the 2000-ft. level of the Pilot Butte mine and cross-cutting will be started in a few days to cut the six veins which have been proved, by development in the North Butte and Elm Orlu mines, to pass through Pilot ground. The Butte & Great Falls Mining Co. is sinking its shaft 3 ft. per day, the present depth being 90 ft., while a cross-cut will be driven at 300 ft. Plans are under way to raise $100,000 for electric equipment. The Raven mine is shipping 50 tons of ore per week. A heavy flow of water in the mine makes costs heavy. Machinery has been ordered for sinking the Butte Main Range company's shaft to 1500 ft., which will be about 600 ft. from the East Butte.

Five miners were killed and nine injured at the Leonard shaft of the Anaconda company, on April 23, when the hoisting engineer lost control of his engine when lowering two cages of men. Both cages dropped into the sump, one falling 2200 ft. and the other 800 ft. from the 1400-ft. level. The engine and the engine-house were wrecked.

All argument in the suit of Minerals Separation, Ltd., against the Butte & Superior company, which uses the Hyde process, is in, but the decision has not been announced.

NEVADA

Esmeralda County

A rush has set in to a new district 22 miles northwest of Millers and about 11 miles south of Republic. J. P. Sparks has opened two veins, one of which returns up to 286 oz. of silver, $26 in gold, and 7% lead, and the other, 200 ft. distant, assays 150 oz. silver, $6 in gold, and 4% copper. About 75 claims have already been staked. Water is hauled eight miles from King Solomon. An arrangement has been made by the Florence Goldfield Mining Co. and the Jumbo Extension company, by which the former can use 10 stamps, the tube-mill and cyanide plant of the Bonnie Clare mill. The plant will be shut down for about a month to install two Dorr thickeners, piping, and a division in the ore-bin to keep the two ores separate. By this arrangement the Florence will be able to treat about 1500 tons per month. In October 1912 several companies at Tonopah and Goldfield filed a complaint against excessive freight rates on cyanide on the railroads. The companies wanted a reduction from $2.37 and $2.08 to $1.15 per ton. News from Washington, D. C., states that the Interstate Commerce Commission declared that the rates for carload lots from San Diego, California, to Goldfield, Tonopah, and Millers were reasonable.

Mineral County

The Silver Comet mine, near Pioche, has been shipping gold, silver, and lead ores to Salt Lake smelters, and in developing this ore tungsten ore was opened. On the 50-ft. level the vein is 3½ ft. wide, and 2 ft. on the hanging wall will average 30% WO_3. It is between the two streaks of tungsten that the first mentioned ore is mined. Another shaft is down 180 ft. in similar ore. A small concentrating plant may be erected, while a 5-ton motor truck has been purchased to carry ore 14 miles from the mine to the railroad, to be shipped to Pittsburg.

Nye County

The Tonopah-Munhall Consolidated Mining Co. is being formed with a capital of 2,000,000 shares, with 1,500,000 in the treasury. Of the latter stock, 560,000 will be exchanged for outstanding stock of the Northern Tonopah Mining Co. and 500,000 to holders of stock in the old Munhall-Tonopah Mining Co. The properties have been examined by A. S. Haskell. The Northern Tonopah claims are six miles north of Tonopah, and surface rocks are granite, diorite, and rhyolite. Work has been done in rhyolite and samples have shown galena, blende, and copper minerals. A shaft was sunk in rhyolite 20 ft. north of the surface contact of rhyolite and diorite. The 100 and 150-ft. levels were not driven far enough, and an extension of the latter is advised. The Munhall claims are 5000 ft. east from the Tonopah Merger mine.

During the week that ended on April 19, the Tonopah mines produced 11,508 tons of ore worth $248,847. The Tonopah Mining Co. treated 14,712 tons in March yielding $198,900 at the mill, and $33,850 from 118 tons of concentrate shipped. The net profit was $133,395. A winze on No. 5 level of the West End has opened 4 ft. of ore assaying from $100 to $200 per ton. The winze has averaged from $16 to $35 per ton for 90 ft. of sinking, and this depth corresponds with the No. 6 level.

Electric power is of great benefit to Manhattan, and the consumption at 30 mines and mills is about 8000 kw. per day. At present the cost of power, 4c. per kilowatt-hour for hoists and 2c. for constant-speed motors, is about two-thirds that of gasoline engines, and less than half that of steam power.

Washoe County

The property of T. Warner and C. W. Nelson, in the Granite district at Peavine, 14 miles north of Reno, has produced 80 tons of high-grade copper, gold, and silver ore, while 60 tons was shipped from the Red Metals mine.

White Pine County

Freight rates between the Ely district and the Utah smelters have been under discussion of late, and the Nevada State Railroad Commission has suggested the following charges per ton of ore to the railroad companies concerned:

Value of ore.	Present rate.	Proposed rate.	Value of ore.	Present rate.	Proposed rate.
$ 7.50.....	$ 3.00	$ 1.75	$ 70.00.....	9.25	5.80
10.00.....	3.00	2.25	80.00.....	9.90	6.00
15.00.....	3.00	2.60	90.00.....	11.00	6.20
20.00.....	3.00	3.00	100.00.....	11.00	6.40
30.00.....	5.00	3.90	150.00.....	12.50	7.70
40.00.....	6.40	4.50	200.00.....	14.00	8.60
50.00.....	7.85	5.10	250.00.....	15.50	9.40
60.00.....	9.52	5.60	300.00.....	17.00	10.30

During March the Nevada Consolidated mine produced 5,555,320 lb. of copper, as against 4,798,537 lb. in February.

A rush has set in for Johnson's Springs, about eight miles west of Cherry Creek, and several automobiles from Ely have gone out. This new 'camp' is said to contain gold-bearing ore, in contrast to the many silver districts of Nevada.

OKLAHOMA

Pushmataha County

According to the United States Geological Survey, there have been persistent reports of the discovery of gold and other valuable ores near Albion, metal contents ranging between $60 and $600 per ton, and several 'mining companies' were organized and stock sold. H. G. Ferguson, assistant geologist of the Survey, made an examination of the locality in March, and reported the entire absence of gold or other metals in commercial quantities. The rocks are chert, shale, and sandstone, carrying a little pyrite, and there is no indication of any vein or metalliferous deposit.

MAP OF OKLAHOMA.

OREGON

Josephine County

(Special Correspondence.)—The placer season is drawing to a close in southern Oregon, and many of the smaller mines have already closed on account of shortness of water. The larger properties will keep their giants at work for a month or so yet; and some of them will have a full pipe-head till late in June, but the greater part of the gold from the surface mines will be cleaned up by the end of April. Shipments of gold are already being made through the banks to the Mint at San Francisco.

For the especial benefit of the miners of Galice district, lower Rogue river, the county is building a new steel bridge across the Rogue at Massie's Ferry. In addition to building the bridge, several thousand dollars will be expended on the road, thus giving much better transportation facilities for the district.

New Yorkers will operate 10 or 15 of the Greenback's 30 stamps this summer, and work will probably be continued through the fall and winter. Development will be done on the Cowboy, Lyttle, Queen of Bronze, and other copper properties of the Waldo district, southern Josephine county. Ray Bros. are making good progress in overhauling the Braden mine, near Gold Hill. They will have the mine operating to full capacity by the middle of May. The Oriole Mining Co. will have its new mill and concentrating plant finished by the end of June. In the meantime, a large quantity of ore is being opened. Equipment and supplies are going over the road from Medford and Jacksonville for the mines of the Blue Ledge district. The old Jewett mine, near Grants Pass, has been completely overhauled. The Michigan Mining & Milling Co. has resumed work on its property, the Michigan mine, near Murphy, on Applegate river. This mine has been idle for the past five years. The old Mountain Lion mine, on Missouri flat, Applegate river, is also being overhauled.

Grants Pass, April 11.

UTAH

Juab County

The Grand Central shaft has been repaired, and work resumed. The south drift on the 2380-ft. level is now in low-grade ore. The 1300-ft. level of the Eagle and Blue Bell is yielding good gold and silver ore. The weekly ore shipments from the mine are from 800 to 1000 tons. The Gold Chain and Opohongo companies will prospect ground above the main adit-level from which the Gold Chain shaft was sunk.

Summit County

The Court of Appeals at St. Louis has affirmed the decision of Judge Marshall giving the King Consolidated Mining Co. judgment for $734,243 for ore alleged to have been taken from its property by the Silver King Coalition Mines Co. In addition to this sum, the court added $24,000 to be paid. An appeal will be taken to the United States Supreme Court. The suit started in December 1909.

At the Ontario mill two additional roasting-furnaces are being built, making a total of eight. A 100-hp. motor has been installed to drive the large blower. The Silver King Coalition Mines Co. has paid a dividend of 15c. per share, amounting to $187,500.

Whitman County

The Pullman Mining & Milling Co., which owns 10 claims, known as the Salmon river junction quartz claims, 50 miles south of Lewiston, plans considerable development, and later on will erect a concentrator costing $20,000. There are four veins in the property carrying copper, silver, and gold, which assay from $7 to $80 per ton at the outcrops. C. Heller is superintendent.

CANADA

British Columbia

During the first fortnight of April the Granby smelter treated 47,708 tons of ore and shipped 762,000 lb. of copper. The Rambler-Cariboo mill is to be enlarged to handle the zinc content of the ores. A snowslide did some damage to a bridge across a canyon at the mine. Snowslides have caused almost a cessation of work at Bandon. The aerial tramway of the Richmond-Eureka and the pipeline of the Slocan Star were partly carried away last week. The flotation plant of the Britannia mine is expected to be in operation in May.

Ontario

(Special Correspondence.)—Owing to insufficient support and the concrete anchors moving in the mud during the recent wet weather, the double penstock of the Wawalatin Falls hydro-electric power-plant, which supplies Porcupine with power, buckled in several places, putting the machinery out of commission for about two or three months. The Pearl Lake company has been compelled to suspend operations owing to lack of power, while the Hollinger and Dome are working with a temporary supply. The 10-stamp mill of the Dome Lake Mining Co. has started work, this being the sixth mill in the district.

Timmins, April 11.

During 1912 the Beaver Consolidated Mines, Ltd., produced 689,921 oz. of silver, valued at $409,212. Dividends paid amounted to $180,000, and $172,511 was carried forward. Ore reserves are 20,000 tons on the dump, and 3000 to 9500 in the mine, containing 775,000 oz. The mill is now treating 100 tons per day, and from March 15, 1912, to February 28, 1913, treated 17,842 tons, yielding 278,512 oz., with a profit of $123,655. On the 700-ft. level of the Beaver mine, on April 11, a shoot 3 in. wide, averaging 8000 oz. per ton, was cut. The McKinley-Darragh-Savage mine produced 430,923 oz. of silver during the first quarter of 1913. The draining of Cobalt Lake will be beneficial to this mine. The old Nipissing reduction mill of 70-ton capacity has been leased by the Cobalt Aladdin Mining Co. and is used as a customs plant. During March, La Rose Consolidated produced 239,934 oz., with a profit of $74,104. Development on No. 3 level of the St. Anthony, in the Sturgeon Lake district, has opened 230 ft. of ore from 12 to 32 ft. wide, and the 10-stamp mill is yielding $20 per ton. No. 2 level has opened $13 ore for some distance.

The second annual report of the Hollinger Gold Mines, Ltd., has just been issued.

Personal

Professional men are invited to send news of their engagements and travels. Such news is interesting to friends.

H. E. SYMMONS is in Irkutsk.

E. B. KIRBY is in New York City.

VICTOR M. BRASCHI is in New York.

WEBB SMITH was in the city Tuesday.

H. C. HOOVER has returned from Europe.

THOMAS B. STEARNS is visiting New York.

A. CHESTER BEATTY sailed for Europe Tuesday.

C. B. NAREMORE was in San Francisco this week.

GEORGE F. BECKER has gone to the Isthmus of Panama.

H. C. BELLINGER has returned to New York from London.

W. E. THOANE has arrived at Bodaibo in the Lena region.

C. W. MERRILL has gone to Santa Barbara for a vacation trip.

C. R. CORNING will leave New York for South America today.

J. A. BURGESS was in San Francisco Wednesday and Thursday.

WILLIAM H. LANDERS has returned to San Francisco from New Almaden.

AUGUST HOFFMANN has returned to Stockholm from the Ural mountains.

R. E. SMITH has finished investigating the Oodeei region and has returned to Nikolaievsk.

The San Francisco Engineers' Club has changed the date of its weekly luncheon to Friday.

A. WARNER HOOKE, of London, is now with the Forum River Tin Co., Ltd., Naraguta, N. Nigeria.

J. F. A. STRONG, of Juneau, has been appointed Governor of Alaska to succeed WALTER E. CLARK, resigned.

JAMES DOUGLAS is visiting Phelps-Dodge properties in the Southwest, expecting to return to New York about May 1.

ALTON L. DICKERMAN, who has been visiting the copper mines of the Southwest, was in San Francisco this week.

EDWIN J. COLLINS, who has been engaged in examination work in Arizona and New Mexico for the past month, has returned to Duluth.

E. M. RABN, engineer for the Gold Road Mines Co., of Arizona, has been appointed mine superintendent of the Gold Road mine, S. A. HOLMAN having resigned.

ROBERT E. CRANSTON has severed all connection with the Brazil company, and will continue the practice of his profession with headquarters in the Mills building, San Francisco.

Schools and Societies

THE MICHIGAN COLLEGE OF MINES graduates of 1913 were given a Class Day address by J. A. Holmes, Director of the United States Bureau of Mines, on April 24, at the college gymnasium.

PRINCETON UNIVERSITY has received gifts of $255,000, including an endowment of $100,000 for the professorship of chemistry, $125,000 for another professorship, and $30,000 for the professional salary fund.

THE IOWA ACADEMY OF SCIENCE met at the Iowa State College at Ames, April 25. Among other papers read were a number by C. R. Keyes, J. L. Tilton, J. E. Gow, and others dealing with local geological features.

R. E. EARLE, of the Department of Geology of the University of the City of New York, read a paper on April 7 before the New York Academy of Sciences on 'The Origin of the Great Deposits of Interbedded Iron Ores of the Appalachians.' The lecture was illustrated by a number of rock specimens and also by lantern slides.

HARVARD UNIVERSITY and the Massachusetts Institute of Technology have practically decided to coöperate in the teaching of advanced students, when the latter gives up its present site at Boston and moves to its recently purchased land at Cambridge, in 1915. There is no intention to carry the plan further than the advanced courses. The University has received bequests of $150,000 from Mrs. S. A. Matchett and $25,755 from George Haven. The Agassiz house, occupied by the late Alexander Agassiz, has been turned over to the Speakers' Club, which is now five years old.

THE AUSTRALASIAN INSTITUTE OF MINING ENGINEERS will hold its annual meeting at Broken Hill, New South Wales, from May 26 to June 4. Besides the usual receptions, business meetings, Institute dinner, and discussion of papers, there will be excursions to the North, South, Central, and Block 10 mines; the concentrating plants of the North, South, Central, Block 10, Proprietary; and the flotation plants of the Amalgamated Zinc, Zinc Corporation, and Sulphide Corporation companies. The new Government water scheme will be inspected; while in South Australia, the Iron Knob deposit, which at present supplies the Port Pirie smelters of the Proprietary company, and will supply the new iron works being erected at Newcastle, is to be visited, along with the Port Pirie lead smelter and refinery, and the zinc distillation plant.

THE MICHIGAN COLLEGE OF MINES is considering the advisability of starting a course in Spanish. W. L. Cumings, of the Bethlehem Steel Co., who graduated in 1900, and has spent a considerable time in Mexico, has collected data showing that 20% of the graduates from this college are employed in Spanish-speaking countries, another 20% has worked there, and 10% more may be employed there. Instruction in the language would thus benefit about 50% of the graduates. With the completion of the Panama canal, it is certain that the Central American republics will attract a great deal of attention. Many European graduates in engineering, who go to these countries, know Spanish, and the Americans should be so equipped. The course proposed is of two years, one hour daily for five days each week, and the method of teaching advocated is the conversational.

THE FARADAY SOCIETY held its sixty-seventh ordinary meeting at Burlington House, London, on March 12, when a general discussion on 'Colloids and their Viscosity' took place. Several scientists came from the Continent, and Wolfgang Ostwald, of Leipzig, made an introductory statement on 'The Importance of Viscosity for the Study of the Colloidal State'; Victor Henri, of Paris, read an article on 'The Measurement of the Size of Colloidal Particles'; and H. Freundlich and C. Ishizake, of Brunswick, discussed 'On the Rate of Coagulation of $Al(OH)_3$ Sols. as Measured by the Viscosity Change.' In the first-mentioned paper the author shows how extremely important is the study of viscosity, though apparently a special subject, for our knowledge of the colloidal state, as regards both theory and practice. The phenomena of viscosity in colloids, present in themselves extreme variety, both qualitatively and quantitatively. The viscosity of molecular solutions in a given solvent is defined by only two variables, concentration and temperature. With colloids, viscosity is affected qualitatively by the following factors, in addition to concentration and temperature: degree of dispersity, solvate formation, electric charge (ionization), previous thermal and mechanical treatment, innoculation with more viscous colloid, phenomena of 'ageing' of various kinds, the influence of various additions, and so forth. In regard to quantitative factors, it is to be noted that the viscosity of gelatinizing colloids can pass through all values from that of the dispersion medium to that of a solid, within limits of concentration from 0 to 1%. An equally large quantitative variation of viscosity occurs within certain small intervals of temperature, about the so-called melting or setting point of jellies.

Market Reports

LOCAL METAL PRICES

San Francisco, April 24.

Antimony	12—12¾c	Quicksilver (flask)	41
Electrolytic Copper	16¼—16¾c	Tin	52—53¾c
Pig Lead	4.75—5.70c	Spelter	8—8¼c

Zinc dust, 1400 lb. casks, per 100 lb., small lots $9.50—9.75; large $7.50—8.50

METAL PRICES

(By wire from New York.)

NEW YORK, April 24.—Copper is quiet, hardly any being sold. Lead is firm and in large demand. Spelter is weak due to selling pressure and little demand. Average daily prices for the past week in cents per pound, based on wholesale transactions, standard brands, are given below.

Date.	Silver, per oz.	Electrolytic Copper.	Lead.	Spelter. St. Louis
April 17	59⅜	15.48	4.35	5.45
" 18	59⅜	15.48	4.35	5.45
" 19	59⅜	15.48	4.35	5.45
" 20	Sunday.	No market.		
" 21	59⅜	15.40	4.35	5.40
" 22	60	15.40	4.45	5.40
" 23	60⅛	15.40	4.50	5.40

Copper prices seem to be steadier all round. Calumet & Hecla withdrew from the New York market at 15½c. more than two weeks ago and has been holding out for 16c. abroad. Telegraphic advices report the London market steady and New York dull, evidently waiting. Phelps-Dodge and the A. S. & R. have been quoting 15¾ in London for May and June delivery, electrolytic. Amalgamated has been selling in France at 15.65, but later asked 15.70 for May, June, and July delivery. Henry R. Merton & Co. report European copper stocks February 28 as 44,673 tons of 2240 lb. each. This does not include Bremen and minor ports which December 31 held nearly 5000 tons.

Eastern brokers report that market activity in mining stocks in New York last week was confined mainly to Tonopah stocks. The sharp advances followed by reactions were interpreted as part of a move to eliminate habitual 'short-sellers' who have been a disturbing factor. In the meantime the Tonopah stocks have attracted the attention of Boston curb brokers.

In view of the dull sessions held in that city, covetous eyes are being cast by members and traders at them, and representatives visited New York and Philadelphia recently to bring about the listing of the active Tonopah on the Boston Curb. As soon as the data required can be obtained it is likely that something will be done. Boston's preference for the copper stocks is well known, but new coppers are scarce and the principal old coppers have been transferred from the Curb to the Exchange. These conditions have brought about a great reduction in the Curb trading list and this is helping to bring the Tonopahs into favor. Two or three Cobalt stocks have been dealt in on the Curb, but never featured, and the same applies to the Goldfield stocks. A broader market and a more extended mining trading list would be greatly welcomed on the Curb in Boston, and it is likely that the effort will be kept up until the active trading list has been increased by desirable new additions from the gold-silvers.

MINOR LEAD AND ZINC PRODUCTION IN 1912.

Detailed figures of production recently issued by the United States Geological Survey credit Wisconsin mines with a total lead and zinc output in 1912 of $4,793,190. The total tonnage of crude ore was 1,363,636 containing 0.2% lead and 2.9% zinc. From this were produced 3373 tons of concentrate containing 76.5% lead and worth $180,661; 102,617 tons of blende concentrate containing 38.4% and worth $2,908,892; and 4360 tons of zinc carbonate averaging 16.66% and worth $72,800. Illinois is credited with lead production amounting to $86,497, zinc worth $367,537, and silver worth $2909. The silver came from the lead concentrate now in the southern part of the state as a by-product of fluorspar mining. The concentrate from this district averages 6.31 oz. silver per ton. The Arkansas production for the year amounted to: lead, $2180; zinc, $56,235. The Kentucky output of concentrate was valued at: lead, $9540; zinc, $41,391. Iowa produced lead concentrate worth $3900.

THE KENNECOTT MINES CO. has declared another dividend of $1,000,000.

Company Reports

SUPERIOR & PITTSBURG COPPER COMPANY

In the four main sections of this Arizona property, development work covered 29,547 ft. during the year ended December 31, 1912. In the Cole section, oxidized ore was mined on the 800, 900, and 1000-ft. levels. A cross-cut is being driven on the 100-ft. level to connect with the old 1100-ft. level workings of the Cole. Work done on the 1300-ft. level in the Briggs section may prove one of the largest bodies of sulphide ore found in Bisbee. Ore opened in No. 97 cross-cut, on this level, is irregular, bnt averages 7% copper. South of this, another shoot 420 ft. long and averaging 10 ft. wide has been developed. The Briggs shaft is handling 400 tons of ore per day. The Junction shaft is being lined with concrete. Work in this section has been encouraging. The most important development during the year in the Hoatson section was the work below the 1400-ft. level of the oxidized orebody, it being found to extend to the 1500-ft. level. Details of the year's work are as follows:

Ore smelted, tons	288,429
Copper recovered, per cent	6.36
Copper production, pounds	36,618,399
Silver production, ounces	361,227
Gold production, ounces	13,815
Value of total production	$6,186,964
Expenditure	2,813,047
Net income	3,393,619
Dividends paid	1,919,734
Cash, ore, and bullion	2,705,248

STEWART MINING COMPANY

This company operates in the Coeur d'Alene district, Shoshone county, Idaho, and the report under review is for the six months ended December 31, 1912, and would be best presented in the following form:

Ore milled, tons	97,290
Ore shipped, tons	2,753
Total	100,043
Revenue from concentrate sold	$485,164
Revenue from ore sold	105,960
Total	$591,125
Costs:	Per ton.
Mining and development	$2.15
Ore transport	0.15
Milling	0.35
Management and general	0.31
Taxes and depreciation	0.15
Litigation ($58,114)	0.57
Total	$3.68
Net profit	$222,623
New construction, from profits	12,235
Added to cash assets from profits	210,388
Net current assets (cash in banks, $328,582)	354,622
Plant and equipment account	86,575
Surplus	650,363

EAST BUTTE COPPER MINING COMPANY

This company's fiscal year now ends on December 31, 1912, instead of March 31 as heretofore. The company has continued operating the properties of the Pittsmont Copper Co. under an extension of the agreement of April 8, 1909. Notes amounting to $1,625,574 fell due on December 1, and were met by applying cash surplus of $1,125,574, and issuing company notes amounting to $500,000, payable in five equal instalments. With this settlement, the East Butte company secured 800,000 of the 1,000,000 shares in the Pittsmont company, and 200,000 preferred shares carrying 6% cumulative dividends. Mine development covered 7130 ft., mostly on the 1000-ft. level, to open veins already proved on No. 8 and 12 levels, while several other orebodies were opened. The main shaft is now being sunk from the 1200 to 1800-ft. level. Ore reserves are somewhat less than in previous years. A sample mill of 1200-ton daily capacity was constructed, and is giving good results. In the past, the concentrating plant has been supplied with mine water, but as this was becoming more acid, a new supply was obtained from the company's land at Elk Park. It is intended to enlarge the blast-furnaces when opportunity allows. The new dust-chamber has increased the recovery to the value of $100,000, and the Dwight-Lloyd sintering plant has helped to the extent of $50,000. Operations during the year resulted as follows:

Ore treated (company), tons	96,601
Ore treated (custom), tons	85,173
Copper produced, pounds	14,709,460
Silver, ounces	370,675
Gold, ounces	16,920
Gross value of metals shipped	$2,841,205
Other revenue	314,271
Total	3,155,475
Cost of mining, treatment, refining, custom ore, etc.	1,875,738
Profit	1,279,737
Interest and equipment	296,036
Net profit	983,701

BRITISH COLUMBIA COPPER COMPANY, LTD.

This company operates mines and a smelter at Greenwood, Boundary District, British Columbia, and has an issued capital of $2,958,545. The report of the president, Newman Erb, for the year ended December 31, 1912, states that 740,589 tons of ore, of which 443,022 tons was from the company's mines, was treated at the smelter, yielding 11,146,811 lb. copper, 142,025 oz. silver, and 25,863 oz. gold. The net results of operations were $425,985, and $177,513 was paid in dividends. During the year the company paid on account of four new properties optioned in British Columbia, and their development, the sum of $229,489. Nine of these were acquired, while interests were taken in the Copper mountain district. The company added to its holdings of New Dominion securities, bonds of the par value of $237,675, costing $122,249. The acting general manager, Frederic Keffer, stated that in the Mother Lode mine, which produced 410,686 tons of ore, the transverse-stope method of mining was continued, it being the best applicable to this mine. Drilling of new ground ahead of requirements was done by 5000 holes, totaling 65,000 lineal feet, in readiness to blast. Ore reserves have not materially increased. The Wellington mine has been temporarily shut down. There is 300,000 tons of ore in the Lone Star and Washington mines, but the ore is refractory, and experiments are being made for its treatment. From the Napoleon mine, 17,118 tons of sulphide flux, with good gold and sulphur contents, was mined. The Napoleon mill treated 6483 tons of ore. The ore in the Queen Victoria mine is an altered limestone carrying copper, and the mine was purchased in November and produced 1080 tons. The smelter consumed 103,154 tons of coke. Basic linings are to be used in the converters. Twenty-three groups of mining claims were examined by the company's engineers. The average price received for copper was 16.66c. per pound, and the cost of production was 12.85c., and the cost per ton, from ore in place to sale of contained metals, was $2.46.

Assets include metal and smelter products, $193,055; copper on hand and in transit, $214,769; cash in banks, $83,602; while liabilities include sundry creditors, $336,910; profit and loss account, $965,737.

GREAT BOULDER PERSEVERANCE GOLD MINING CO., LTD.

This important property is at Kalgoorlie, Western Australia, and is now producing low-grade ore which yields fair profits. During the year ended December 31, 1912, with the exception of driving the 2200-ft. level on the Lake View lode, development of this and the Perseverance lode was restricted in favor of opening the Furness and D lodes, while efforts to find an extension of payable ore on the

Perseverance lode on No. 11 level were not successful. The Furness lode has been proved continuous from the 200 to 1100-ft. level, and there is blocked out 52,300 tons averaging $5.27 per ton. The D lode has yielded ore on the 200, 300, 400, and 500-ft. levels, and contains 26,000 tons of $6.48 ore. Prospecting in parts of the mine opened in past years has revealed a good deal of ore, and on No. 2 and 7 levels the El Oro lode is yielding good ore; on No. 4 and 5 levels, on the west branch of the Lake View lode, results are encouraging, while the Lake View lode on No. 5, 7, 9, and 11 levels will add considerably to reserves. Driving, cross-cutting, winzes and raises, and chambers covered 8320 ft. at a cost of $11.82 per foot, while leading stopes and 'stulling' covered 4656 ft. During the year 240,912 tons of ore was stoped from an average width of 12.68 ft., worth $6.14 per ton, at a cost of $1.06 per ton. Stope filling used 15,667 tons of sand and waste rock. Ore reserves are estimated as follows:

	Tons.	Value.
Ore developed	320,800	$5.84
Broken ore	177,460	5.80
Total	498,260	$5.82

The mill treated 234,636 tons, with 89.76% extraction, yielding 62.932 oz. gold and 7839 oz. silver, worth $1,299,650, costs being as follows:

Mining, per ton	$1.72
Treatment	2.34
Stope filling	0.01
General expenses	0.17
Disposal of residue	0.12
Total cost per ton	$4.36
Net profit for year	$120,000
Brought forward from previous year	320,000
Dividend paid	160,000
Carried forward to 1913	270,000

YUKON GOLD COMPANY

The report of the president, S. R. Guggenheim, for the year 1912, states that the company acquired by purchase or lease, control of the principal properties in the Iditarod district, Alaska, and there is reason to expect that they will add considerably to the profits. The cash required for this business was $1,600,000, which accounts for the $725,000 increase in debt to the Guggenheim Exploration Co. The Iditarod property was equipped with a dredge moved from the Klondike, and after the other dredges in that district have finished their work, they will be transferred to other properties acquired. The company's assets total $21,223,414, made up of property and investments, $12,026,121; equipment, $6,935,801; supplies, $879,292; amounts collectable, $502,965; advanced royalties, $340,604; and cash, $97,351. The surplus on December 31, 1912, was $409,276; depreciation account, $586,893; and bills payable, $202,272. The capital is $17,500,000. The report of the general manager, O. B. Perry, states that the dredgable area acquired in Alaska contains 5,500,000 cu. yd., a large amount of which is thawed. At Dawson, Yukon, No. 7 dredge was dismantled and was reërected at Iditarod, Alaska. Its weight was 850 tons, and was delivered in gasoline boats after many delays. A 300-kw. steam-driven turbine and 4400-volt generator, and a 2-mile transmission line was installed to supply the dredge with power. In 75 days it dealt with 172,333 cu. yd. of gravel, yielding $404,040, equal to $2.34 per cubic yard, some of the gravel returning $8.90 per yard. The cost was 45.91c. per yard. The quantity treated was low, but will increase during the 1913 season. The 8 dredges at Dawson worked from the beginning of May to October 24, during which time they worked 86.15% of the possible time, and handled 5,157,280 cu. yd., yielding $3,346,026, or 64.88c. per yard, at a cost of 30.64c. per yard. This result was an increase of about 1,000,000 cu. yd. over the 1911 season, due to an extra dredge working, a higher capacity for all dredges, an increase of 4% of mining time, and better physical conditions. Steam thawing covered an area of 509,544 sq. yd., or 73.58% of the area mined. This method is gaining in efficiency, leading to better dredging. The two all-steel dredges did excellent work under severe conditions.

The hydraulic mines produced $629,043 from 2,967,750 cu. yd. of gravel, an increase 842,000 yd. over 1911, at an average cost of 9.37c., against 15.5c. per yard. Better water conditions helped this result. The Twelve Mile water system was in operation 168 days, and delivered 524,249,000,000 in. of water, at a cost of $76,760 for maintenance. The power plant on the Little Twelve Mile worked throughout the season. Other properties yielded a total of $484,337 at a cost of $204,672.

The year's operations may be shown as follows:

	Gravel, cu. yd.	Yield.	Profit.
Dawson dredges	5,157,280	$3,346,027	$1,765,737
Dawson hydraulicking	2,967,750	629,043	351,090
Iditarod dredge	172,333	404,040	324,926
Other operations	.....	484,337	279,666
Total		$4,863,448	$2,721,419
Royalties paid			692,995
Amortization and deferred charges			577,146
Interest, general, etc.			378,686
Net profit			$1,072,292

OLD DOMINION COPPER MINING & SMELTING COMPANY

This company's mines and works are at Globe, Gila county, Arizona, and the report for the year ended December 31, 1912, gives the following information. Mining and development covered 15,259 ft., and of the sinking done, 96 ft. was in the pump shaft from No. 10 to No. 11 level, also 107 ft. in the winze from No. 16 to No. 18 level. Water encountered in the winze interfered with work, and the winze was allowed to fill until development on No. 16 and No. 18 levels should be further advanced. During the year 854,340,000 gal. of water was discharged through the drainage adit, and 587,140,000 gal. was pumped to the surface. The Miami Copper Co. bought 732,000,000 gal. An Aldrich 18 by 18-in. electric quintuplex pump of 1000 gal. per minute capacity was installed to lift water from No. 16 to No. 12 level. No important changes have been made in mining methods. As in the past, the heavy wet ground on the west side has necessitated square-set and fill, while the stopes in more solid ground on the east side have been carried up, where possible, by cut and fill without timber. During 1913, sorting of ore in the stopes will be undertaken. Power costs were reduced by new contracts for fuel oil. Arrangements were made with the Copper Queen company to treat the flue dust in its reverberatory plant, and if the trial is satisfactory to the Old Dominion company's advantage, this procedure will be continued. In December the first Great Falls type of basic converter, 7.75 by 12 ft., started work. Slag re-treated amounted to 3500 tons. Construction work on the crusher, sampling, and concentrating plants is proceeding well, and the first two departments may be ready by September, and the concentrator about two months later. In June the working hours underground were reduced to 7½ hours, and wages were increased in September by 25c. per shift. The surface employees' hours were reduced from 9 to 8½ hours per shift. The year's results may be stated as follows:

Old Dominion ore production:	
Copper, pounds	16,533,999
Silver, ounces	42,750
Gold, ounces	583
Custom ore production:	
Copper, pounds	10,819,244
Silver, ounces	100,261
Gold, ounces	2,619
Total receipts	$2,888,203
Expenditure	1,884,017
Profit	1,004,186
Dividends	729,000
Surplus on December 31, 1912	962,229

Concentrates

Most of these are in reply to questions received by mail. Our readers are invited to ask questions and give information dealing with the practice of mining, milling, and smelting.

DUST-CHAMBERS for the roasting and blast-furnace plants of the Calumet & Arizona smelter are 60 by 140 by 70 ft., and 60 by 180 by 70 ft. They are equipped with baffles and wires.

ACCEPTED VALUE for the weight of a dense crowd of people has been for nearly a century about 100 lb. per square foot, allowing for the kinetic effects of crowds on bridges, buildings, and other structures.

GOLD PRODUCTION of the world in 1912, as estimated by *The Mining Magazine*, was valued at $472,800,000, 10% of which is an estimate, as the exact output from certain countries is never obtainable.

ZINC-DISTILLATION at the Broken Hill Proprietary works, at Port Pirie, is accomplished in a plant having an annual capacity of 10,000 tons, and the production in 1912 was 2260 tons of spelter, and 284 tons of zinc-dust.

SILVER has been found in Missouri in quartz veins in the pre-Cambrian crystalline rocks. The lead found in the sedimentary rocks contains a small amount only of silver, and reported discoveries of silver deposits, using the term in its usual sense, warrant little attention.

MINING GEOLOGY is hereafter to receive special consideration from a committee of members of the American Institute of Mining Engineers. Of the new committee Waldemar Lindgren is chairman, J. W. Finch and R. A. F. Penrose, Jr., vice-chairmen, and L. C. Graton, secretary.

COSTS at the North Star mine during 1912 were: mining, $3.07; milling, 49c.; concentrating, 14c.; cyaniding, 50c.; bullion account, 3c.; miscellaneous, 27c.; general expenses, 15c.; and taxes, accident, and benefits, 7c.; making a total of $4.97 per ton. Development covering 4601 ft., cost 57c. per ton.

MINERAL LANDS withdrawn by the United States Geological Survey, under authority, during the fiscal year 1912, amounted to 1,400,000 acres for oil, and 1,200,000 acres for phosphate reserves; 350,000 acres for water-power, and 60,000 acres for irrigation-reservoir sites; and 86,000 acres for public water reserves, essential to the control of public grazing lands.

ELECTRIC FURNACES for treating ores and making steel have not yet been standardized in America. The Bailey furnace, made by the Electric Furance Co., of Alliance, Ohio, is used at a number of small plants. The larger furnaces in Shasta county, California, were built by the Noble Electric Steel Co., the operating concern, with the help of the Wellman-Seaver-Morgan Co. of Cleveland, Ohio.

ANTIMONY ORE is reduced in this country by the A. S. & R. Co., the U. S. S. R. & M. Co., and the Baibach S. & R. Co. at Eastern furnaces. No antimony metal is made on the Pacific Coast, though occasionally in periods of high prices ore is exported. Current United States production of the metal is about 2100 tons per year. Imports, including metal, regulus, and crude ore, amount to a trifle less than 8000 tons.

HIGH PRESSURE is essential to good results in the use of air drills. A recent visitor to a European quarry where the manager complained that air drills were not economical, found one outlet stopped with a wooden plug that was leaking badly. The *South African Mining Journal* has been investigating air pressures on the Rand, and while it is found that the pressures have been raised in recent years, the average, from Randfontein to Geduld, is placed at 60 lb. In the United States this would be considered absurdly low. All the record work on tunnel driving that has been done here has been based upon high-pressure air among other things. In driving the Newhouse tunnel, the pressure was held at 100 to 125 lb. At each increase in pressure the footage leaped and costs dropped, and the experience is typical. To maintain high pressures economically, large and well laid lines are necessary, but it is false economy to attempt working under other conditions.

LOCAL TERMS for the same operation or device differ the world over. On the Rand what is known in the United States as a 'hoist' or a 'hoisting engine' is called a 'winding engine,' a term that would be equally applicable, apparently, to an engine reeling a rope stretched horizontally as in cable haulage. The operator of a 'winding engine' is an 'engine driver.' In the United States, in general, he is a 'hoisting engineer' and jealous of his title. In the Missouri-Kansas zincfields, where, as in France, "they order things differently," he is a 'histerman' and the term engineer is reserved for the man who fires the boiler.

THE GEOPHYSICAL LABORATORY of the Carnegie Institution at Washington, in 1912, concluded an investigation into the study of minerals with the petrographic microscope upon a quantitative basis, so far as practicable. Chemically pure silicate preparations (mineral types) have imposed new and difficult problems to be solved by the microscope, and to meet new conditions, extensive alterations have been made to the instruments. As a general result, it may be stated that, on clear individual grains, measuring from 0.01 to 0.03 mm. in diam., all the optic properties ordinarily studied in the microscopic investigation of minerals in the thin section, can now be determined with a satisfactory degree of accuracy. The work has occupied six years, and the methods are finding a wide field of usefulness. Another investigation deals with the means for the more accurate measurement of temperatures, beginning with the low temperatures of every-day life, and extending upward to the melting points of the most refractory metals and oxides. Results showed greatly increased accuracy, and a trustworthy temperature scale has been devised to show at what point the component minerals of the earth are stable. The high-temperature section is now in use, but the low temperatures have only recently been determined. The accuracy now attainable in such instruments in the vicinity of 500°C. is perhaps $\pm$ 0.1°, and at 1500°C., perhaps $\pm$ 2.0 degrees.

LODES WITHIN PLACER CLAIMS involve legal complications. One mooted question is, has the placer claimant, before making application for placer patent, the possessory right to, and refusal of, all known lodes without having located them as such? One conclusion from the statutes is that he has. A court decision says that a stranger cannot enter within the lines of a placer location to prospect for lodes, and if he does so enter, and discovers and locates a lode, it is a claim initiated by trespass, and is void. But such a discovered lode now becomes a known lode, just as any lode uncovered in any way, or by anyone, up to application for patent. The placer claimant, or one to whom he has given his consent, may locate a lode. The Land Department has taken the stand that a placer locator has not the possessory right to the lodes within his location, so as to prevent the discovery and location of such lodes by others. This is the proper view, for under that of the court decision referred to, all the veins, as well as the placer mineral in a 160-acre placer location could be held by doing $100 worth of work annually. Undoubtedly, if a case came into court, the good faith of the placer claimant would be a great factor in determining how far a stranger might go in clandestinely prospecting for and locating the lodes within, a placer location. The placer locator may perhaps strengthen his right of possession to the known lodes by inserting in his placer location notice the proviso, "including the right to locate and patent all known lodes." But the proper plan is to at once locate all desired lodes. Lodes within placers should be located in the usual way, with the exception that 50 ft. is the maximum width.

Book Reviews

LEFAX. Compiled by John Clinton Parker. Pp. 12 monthly or 150 pages yearly. Price $1. Pennsylvania Building, Philadelphia.

This monthly publication is simply a loose-leaf system containing, in a convenient form, data of interest to the engineering porfession generally. The sheets are ready punched for filing in a pocket book, and blank sheets are furnished for an engineer's own notes. The information is collected from 31 technical journals, proceedings of engineering societies, and publishers of text-books.

BOOK OF STANDARDS. 1913 Edition. Pp. 516; index. National Tube Co., Pittsburg, Pennsylvania. Price, $2.

The ordinary conception of the function of pipe is for use as a means for conveying fluids. Engineers, however, fail to appreciate how large a part pipe in its various forms is playing in the world of industry. The new edition of the 'Book of Standards,' published by the National Tube Co., while giving due prominence to the ordinary use of pipe, shows that for some forms of work it possesses advantages that are unequaled by any other structural shape. The first part of the book, after discussing the various processes of manufacture, contains tabulations of general dimensions, weight, and test pressures of the various types of commercial pipe and tubing. Types and characteristics of pipe joints are illustrated and described, and their application for various duties discussed. Standard specifications are also given at length and these illustrate excellently the precision of modern pipe-making methods. The large amount of space given to electric line poles is an indication of the wide growth in the application of pipe to this purpose since the publication of the previous edition. The pages devoted to pump working-barrels, cylinders, and cylinder heads is especially interesting as evidencing the encroachment of wrought iron and steel pipe into a field in which cast iron has heretofore held undisputed sway. The fact that the joint between cylinder and head may in many cases be made seamless is not the least of the advantages offered by the substitution. The discussion and tabulated data given concerning the physical and thermal properties of pipe are exhaustive in their thoroughness and attention to detail. The mathematical formulæ, their derivation, and many curves comparing the results achieved by recognized authorities and investigators of the broad subject of the phenomena of fluid in pipes, will be much appreciated by engineers who would ordinarily have to refer to many books to obtain the information given here under one cover. One of the most interesting parts of the book, especially to oilmen, is that on the collapse of tubes due to external pressure. At the instance of the National Tube Co., Reid T. Stewart, dean of the mechanical engineering department of the University of Pittsburg, conducted an exhaustive series of experiments requiring the services of from one to six men for a period of four years. The results of Mr. Stewart's work are given in full and show conclusively the inapplicability of previously published formulæ to present-day conditions. In view of the fact that until the National Tube Co. took up this work the only basis for existing formulæ was the series of experiments conducted by Sir William Fairbairn in 1858, the importance of Mr. Stewart's investigations is at once apparent. Operating men in the oilfields will appreciate the advantage in using the data given as an aid in determining size of oil-well casing.

CLASSIFICATION OF THE PUBLIC LANDS. By George Otis Smith and others. U. S. Geol. Surv., *Bull.* 537. Pp. 597; Ill., index. Washington, 1913.

The most important development within the Geological Survey in recent years has been the land classification work. While land classification was specified as one of the duties of the Survey in the organic act of 1879, it was never taken up in any large way until the Conservation movement and the coal-land scandals of 1905 and 1906 called sharp attention to the necessity of having exact information about each piece of public land. The previous work of the Survey had resulted in the accumulation of a large amount of data that became immediately of value in this connection, and the force then organized has grown into one of the major divisions of the Survey. The classification of coal land, since a definite measurable amount of material is in question, has proceeded along fairly well established lines. It happens that under the law it is possible to value coal lands at any price above a fixed minimum, and the valuations found by the Survey have been adopted as the sale prices. In the case of oil lands it is not feasible, at least as yet, to do more than determine the probable from the improbable oil-bearing lands. The degree of success that may be attained even in this is dependent upon many factors, a large number of which may in any case be unknown. In the case of phosphate rock and potash salts, the price factor and speed of possible marketing is bound to be very important. The Survey is, however, working toward a solution of these problems. The classification of metal-bearing lands has as yet been scarcely attempted, and that is the big outstanding problem for the Land Classification Board. In the meantime, the Importance as well as scope of the Survey's work is illustrated by the following statement recently issued of its activities in March 1913: During the month the Survey classified 1402 acres of coal land, with a valuation of $20,629. It also classified 759,011 acres of withdrawn land as non-coal in character. One coal-land withdrawal of 8826 acres was made in Colorado, and coal-land restorations to public entry amounting to 433,195 acres were made in Colorado, Montana, South Dakota, and Wyoming. One phosphate withdrawal of 826 acres was made in Florida. Water-power reserves were created in California, Idaho, Nevada, Oregon, Washington, and Wyoming, amounting to 10,456 acres, and restorations of 674 acres previously withdrawn for power-sites were made in Colorado, Idaho, and Washington. A public water-hole reserve embracing 1200 acres was made in Arizona.

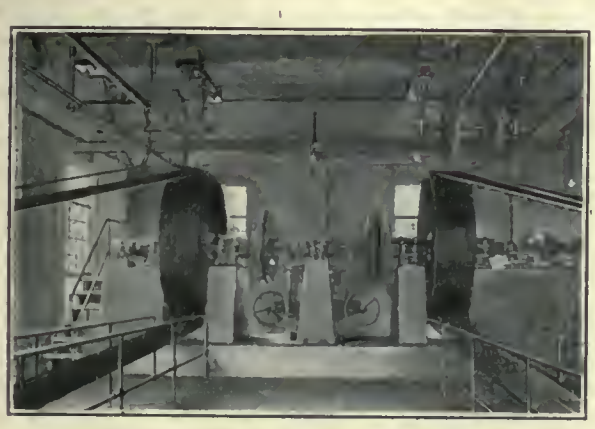
GEOLOGY OF THE COLUMBUS QUADRANGLE. By Clinton R. Stauffer, George D. Hubbard, and J. A. Bownocker. Geological Survey of Ohio. Fourth series, *Bull.* 14. P. 133. Ill., maps, plans, index. Columbus, 1911. This publication has been prepared mainly for geological students, and is written in as non-technical terms as possible. The maps were prepared by the U. S. Geological Survey in coöperation with the state. Chapter I on the 'Historical or Areal Geology' was prepared by C. R. Stauffer; chapters II, III, IV, and V, on 'Physiography or Surficial Geology,' by G. D. Hubbard; and chapter VI, on 'Economic Geology,' by J. A. Bownocker. The volume contains many excellent half-tones and s[illegible] plates of fossils.

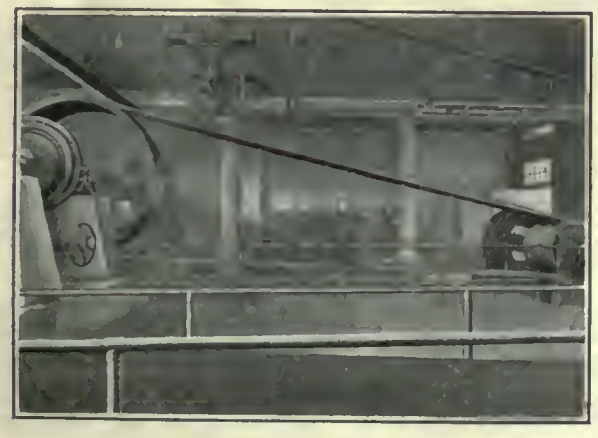
A Rope-Driven Ventilating Plant

In an effort to provide against interruption of service and secure the highest efficiency possible in operation, the Pittsburg Coal Co. has departed from the ordinary practice at its Crescent mine, California, Pennsylvania, duplicating the driving machinery in the fan-house and providing rope transmission between motors and fan. The Dodge Mfg. Co., which installed the system, supplies the following description.

For this particular mill it was not considered necessary to have a reversible fan. The equipment, therefore, was designed primarily for exhausting, and no provisions were made for operating it as a blower. The fan is a double-inlet 'Sirocco' type, manufactured by the American Blower Co., and was designed to deliver 350,000 cu. ft. of air at 157 r.p.m. against a 5-in. water gauge. The wheel is 13 ft. in diameter, 6 ft. 9 in. wide, driven by a central hub,



METHOD OF MOUNTING ON CONCRETE PIERS.



ROPE DRIVE FROM MOTOR.

and mounted on a shaft 10 inches in diameter which is reduced to 8 inches in diameter at the journals. The fan shaft extends into the motor-house and is carried in three Dodge adjustable bearings, one mounted on a concrete pedestal within the house itself, while the other two rest on bridges in the fan inlets. These bridges are of unique design, being constructed of ½-in. steel plate, so disposed as to offer a minimum resistance to the flow of air through the inlets. Only the inlet cones and upper half of the fan casing are steel plate; the lower half and the évasé chimney are of concrete construction.

The fan is driven by a Dodge American system rope drive from two 300-hp., 450-r.p.m., 2500-volt, 60-cycle, three-phase rotor, variable-speed induction motors. These are of the three-bearing type with extended sub-base, speed variation being accomplished by means of resistance in the secondary circuits. The stacks of grid resistance for each motor are inclosed with expanded wattmeters, one recording wattmeter, and two triple-pole automatic oil switches with low voltage release and inverse time limit overload relays. With the exception of the incoming lines, which are carried in the ceiling, all wiring for the motors is placed in conduits under the floor. Current for lighting is furnished by a 110-volt transformer from the high-tension line, the wiring being run in small pipes.

To provide for increased ventilation in an emergency, the rope sheaves are proportioned to operate the fan at normal speed with a motor speed of 400 r.p.m., so that full motor speed would run the fan at 127 r.p.m. or 10% above normal. The sheaves each carry 16 wraps of 1-in. Dodge 'Firmus' manila transmission rope, and are duplicates in every particular. The motor sheaves are of 42-in. and the driven sheaves 107-in. diameter. These latter are mounted on hollow or quill shafts, through which a 7-in. jack-shaft passes. The jack-shaft is rigidly connected to the fan axle with a flanged coupling, and is engaged by 48-in. Dodge patent split friction clutches, bolted to flanges on the ends of the quill shafts, and operated by handwheel and pinion. The quill and jack-shafts are supported independently in adjustable bearings, resting on concrete pedestals, which are joined by a continuous concrete footing to prevent uneven settling.

The motors are set at 30-ft. centres from the jack-shaft, which gives sufficient room to operate the tension carriages inside the building. The winding sheaves and tension-carriage tracks are placed directly above the driving ropes, and are bolted to timbers which are in turn secured by anchor bolts to concrete leveling-pads on the under side of the roof. With this arrangement, extreme accuracy in setting the anchor bolts is avoided and the alignment of sheaves and tracks greatly facilitated.

Pipe hand-railings are provided around the sheaves and ropes, while the clutches are protected by expanded metal guards. Either drive can be thrown in or out without changing the speed of the fan, in fact the sheaves and clutches on the quill shafts being split, one drive could be dismantled without interfering with the operation of the other. The ropes run exceedingly smoothly and are practically noiseless, and in addition, when worn out their replacement is a matter of small expense. In equipping this fan-house the company is looking forward to 35 years of life in active mine work. The output of the mine at present is 6000 tons per day.

A Large Electric Hoist

In a recent consular report is a brief description of a large hoist recently sold for use on the Rand. According to the report, one of the largest and most important electric contracts recently awarded in connection with the Witwatersrand gold-mining industry is that just received by the General Electric Co. of New York, through its subsidiary company, the South African General Electric Co., of Johannesburg, for supplying to the Crown Mines, Ltd., the largest electric mine-hoist in the world, and in fact the largest hoist of any kind whatever which has ever been ordered. The hoist, which is to be supplied by the Schenectady shops of the General Electric Co., will raise 16,000 lb. of ore per trip, in a vertical shaft 3540 ft. deep, at a speed of 3500 ft. per minute. The weight of the empty skip is 3700 lb. The rope is 2 inches in diameter, weighing 6.4 lb. per foot. The hoist will consist of two cylindro-conical drums, of which the smaller diameters are 12 ft. and the larger (cylindrical diameters) 20 ft. 8 in. The speed of the drums will be 53.5 r.p.m. To either end of the drum-shaft there are connected two direct-current, separately-excited electric motors, designed for 500 volts, and each capable of giving continuously an output of 2000 hp. at 53.5 r.p.m. The total weight of each motor will be approximately 142,000 lb., exclusive of shaft and bearing. These two hoist-motors will receive their power from a motor-generator set which converts 50-cycle three-phase power to direct current. The motor-generator will consist of one 5000-hp. (continuous rating), three-phase, 50-cycle, 2000-volt induction motor, operating at 375 r.p.m., direct-coupled to two 1650-kw., separately-excited, direct-current generators. There will also be one 60-kw. shunt-wound exciter for exciting the fields of the two hoist-motors, and the two direct-current generators. The system of control will be what is known as the Ward Leonard system. While

the capacity of the motor-generator set is equivalent to 5000 hp. continuously, the intermittent output from the hoist-motors may be at times 9000 hp., and the corresponding input to the motor-generator set approximately over 11,000 hp. The total weight of the motor-generator set will be approximately 138,000 lb., while its over-all dimensions will be approximately as follows: length, 30 ft., width, 11 ft. 6 in.; height, 10 ft. 3 in. The dimensions of the hoist-motor armatures are so great as to make their transportation over the South African railways impossible, and it will therefore be necessary to assemble and wind them on the spot. It is understood that the contract price for this electric hoist is approximately $125,000.

Jeffrey Swing Hammer Pulverizer

A swing-hammer pulverizer for laboratory use is now being made by the Jeffrey Mfg. Co., which supplies the following details. Crushing is done by means of hammers mounted on a horizontal revolving shaft and swinging out as a result of centrifugal force.

This machine is built especially for use in reducing many

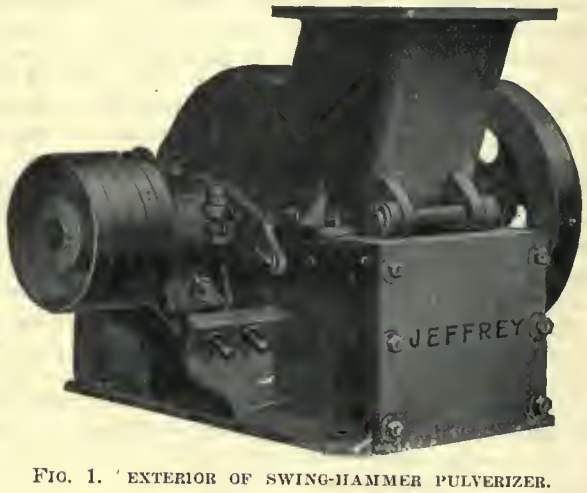


FIG. 1. EXTERIOR OF SWING-HAMMER PULVERIZER.

materials to a fine uniform product for various purposes. It is particularly useful in sampling coal and various ores, as it not only reduces the sample to a comparatively fine powder, but thoroughly mixes it into one homogeneous mass. It also has a place in many industries where a

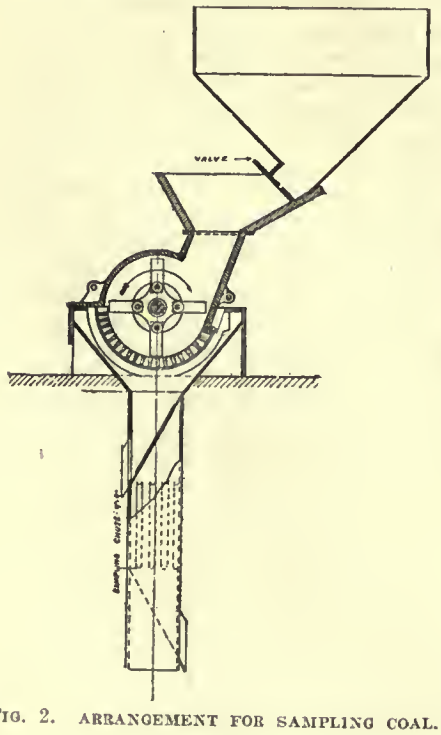

FIG. 2. ARRANGEMENT FOR SAMPLING COAL.

heavy duty or large capacity is not required. While any high-speed machinery is better for being placed on a solid concrete foundation, this machine is so well built that it gives good service when mounted on timbers on an ordinary wood floor, as would be necessary in placing it on one of the upper floors of a factory building.

A good laboratory outfit consists of a pulverizer directly connected to an electric motor. Both are mounted on a single cast-iron base and may be placed in any convenient position, and are furnished complete ready to run.

For sampling coal and kindred uses, the arrangement shown in Fig. 2 will be found excellent. It consists of a hopper large enough to hold a batch in which the material is held by a sliding valve at the bottom. This discharges into a second hopper which leaves an opening into which material may be shoveled without regard to the upper hopper. As the ground material passes out of the pulverizer it is caught in a sampling chute below. The first section of this chute rejects half of the material, the second section is placed at right angles to the first and rejects half the material passing through the first section, and so on, each section rejecting half of the material fed to it from the section above. It is usual to use four sections of sampling chutes, so that but one-sixteenth of the original material is delivered at the bottom of the chutes, but this material will be a true sample of the whole lot.

The construction and size of these hoppers and sampling chutes vary with different conditions and have never been standardized.

Catalogues Received

CROSS ENGINEERING CO., Carbondale, Pennsylvania. 'Simplex Rivetless Chain.' 8 pages. Illustrated. 6 by 9 inches.

OSBORNE PATENTED MACHINERY CO., 120 Liberty St., New York. Bulletin No. 1. 20 pages. Illustrated. 6 by 9 inches.

BAUSCH & LOMB OPTICAL CO., Rochester, New York. 'Engineering Instruments.' 155 pages. Illustrated. 7 by 10 inches.

CHICAGO PNEUMATIC TOOL CO., Fisher Bdg., Chicago. Bulletin E-28. 'Duntley Track Drill.' 8 pages. Illustrated. 6 by 9 inches.

WOOD DRILL WORKS, 30 Dale Ave., Paterson, New Jersey. Folder. 'Talks by the Drillmaster.' 8 pages. Illustrated. 4 by 9 inches.

A. LESCHEN & SONS ROPE CO., St. Louis, Missouri. 'Leschens Hercules' for March and April. 12 pages. Illustrated. 8 by 10 inches.

TABLE OF CONTENTS

EDITORIAL

Announcement

Responding to a gratifying growth in our business, the *Mining and Scientific Press* has established an editorial office in New York City. Mr. Thomas T. Read is in charge, and at our rooms in the new Woolworth building visiting engineers will, as at our other offices, find always a cordial welcome. Mr. Eugene H. Leslie, recently of the *Mexican Mining Journal*, has joined our staff in San Francisco, and extra pages have been added to the paper to allow the publication of a larger amount of reading matter. These changes will permit of greatly improved service, and with strong editorial staffs in San Francisco, New York, and London, supplemented by special correspondents around the world, the *Mining and Scientific Press* is in a unique position. We shall expect to print not only the best but the most comprehensive weekly paper devoted to precious and semi-precious metal mining.

BIG BUSINESS, in Germany as elsewhere, seems prone to make use of a Krupption fund.

IDLE freight cars are in some degree an index of business conditions, and it is gratifying to note that the net surplus of idle cars is now considerably less than at the same period of last year.

FURTHER trouble for California copper smelters is forecast by the bill still under discussion at Sacramento placing them under the jurisdiction of the State Board of Health, and the action of the Shasta county grand jury in declaring the Kennett smelter of the Mammoth Copper Mining Company a nuisance. We believe neither step to be justified.

THE second annual mining exhibition organized by the Chemical, Metallurgical, and Mining Society of South Africa was held at Johannesburg last month, continuing through two weeks. In addition to exhibits of safety and rescue apparatus, of chemical, metallurgical, and mining apparatus, and of specimens, diagrams, maps, and photographs, there were lectures, demonstrations, and conferences. The whole exhibition should prove stimulating and helpful, and the example of the society with the long name might well be followed elsewhere.

RUMORS to the effect that control of the Bunker Hill & Sullivan Mining & Concentrating Company had passed to the Federal Mining & Smelting Company have been current at intervals for some weeks. Recently the story was revamped and unloaded upon a number of newspapers in some detail,

with the addition that Mr. Stanly Easton was to be at once succeeded by Mr. Harry L. Day as manager for the company. We are authorized to state that there is absolutely no foundation for this story. The control of the company lies where it has for years, and the Federal owns only the shares that came to it in settlement of litigation in 1910. Mr. Easton's excellent work is fully appreciated by his directors and they have no intention of letting him get away. Such rumors can only be started with deliberate intention to confuse public opinion. We are glad to state the belief that the Federal company had no hand in starting the particular rumor mentioned.

Leaching in Anaconda

Extraction of copper from its ores by hydrometallurgical processes has engaged the attention of metallurgists, for many leaching methods are attractive to experimenters because of their apparent simplicity, but, as was the case in the development of the cyanide process, it is quickly found in practice that a variety of mechanical problems present themselves, requiring to be overcome before continuous, cheap, and expeditious operations become possible. In addition, the dissolution of copper minerals involves a variety of chemical difficulties not incident to the cyanide process. In the latter only one mineral substance is to be dissolved, while in the case of copper ores the whole gamut of minerals containing copper must be attacked by the solvent. Like the philosopher's stone, a universal solvent would have many uses, but neither ancient nor modern alchemy has discovered any such. For this reason, in addition to others, it is in the highest degree improbable that any one process for the extraction of copper from its ores by leaching will ever approximate universal applicability. In districts where the ore exhibits uniform characteristics, a process may be developed of local utility, but as a rule the devising of a satisfactory hydrometallurgic method for copper will constitute an individual problem in each area; one which can be solved only by careful experiment. A further chemical difficulty is that in most cases a variety of other substances present in the ordinary ore are also attacked by any solvent that will attack the copper minerals. It is rare to find copper ores in which the gangue is silica alone. Finally, there is the factor of relative masses. In the cyanide process the quantity of valuable substance to be dissolved is only a small fraction of a pound. In a one per cent copper ore there are twenty pounds of copper, and a correspondingly greater quantity of the copper mineral, whatever it may be, must be taken into solution. This at once requires a greater consumption of the solvent, and entails a vigor of action that leads to attack upon the other minerals present. There is therefore little reason to suppose that wet methods for the extraction of copper will ever, other than in exceptional cases, be reduced to a basis as efficient and as cheap as the cyanide process in its present state of development.

As an example of the working out of a satisfactory method to meet a given set of conditions, the Washoe plant of the Anaconda Copper Company may be cited. Here Mr. Frederick Laist, the superintendent, has perfected a leaching process originally devised by him some years ago to meet the conditions existing at a remote mine in Utah. A long and careful series of experiments has demonstrated the feasibility of the method under the conditions existing at Anaconda and an 80-ton plant for the trial of the process on a full working scale is now in course of construction, and should be in operation before the end of the summer. A detailed description of the process should properly be left to Mr. Laist, but a brief outline of its general features will be of present interest. The material to be treated is the average tailing from the wet-concentration plant, containing about 0.65 per cent copper. This will be dewatered and, when nearly dry, sent to roasting furnaces of the McDougall type, of which the upper hearths will serve chiefly for drying and preheating, while upon the lower hearths salt will be added in small quantity, and the heat so adjusted that at the completion of the roast the copper will be in a form easily dissolved by the dilute H_2SO_4 used for leaching, while the iron present will be in insoluble form. The resulting calcine will then be leached in vats with dilute sulphuric acid made by the chamber process from the SO_2 gases drawn off from the roasters which treat the rich concentrate from wet concentration. The copper-bearing liquor will be removed by decantation and the copper precipitated by passing H_2S into the solution, precipitating copper sulphide and regenerating H_2SO_4, which may again be used for leaching. The production of H_2S would in ordinary cases probably prove unduly expensive, but at Anaconda there is available auriferous pyrite, from the Georgetown district, which would otherwise require treatment by direct smelting. This ore, by simple fusion, is reduced to iron matte which can be utilized in the hydrogen sulphide generators. The consumption of H_2SO_4 is thus reduced to the amount required for the production of the necessary H_2S, with the added amount that will unavoidably be lost in foul solutions. Since the acid can be cheaply made by the chamber process, it is confidently expected that a high extraction of the copper now being lost in tailing can be made at a cost not exceeding that by present methods. Should the work of the small leaching plant prove as satisfactory as anticipated, the alteration of the wet-dressing plant in accordance with the flow-sheet devised at Great Falls, as mentioned in our issue of January 4, will be abandoned. The single unit which has already been altered has shown results even better than expected, reducing the tailing content to 0.42 per cent copper, but, since leaching methods may be applied to the ordinary tailing with equal advantage, the capital expenditures required for alteration may with advantage be diverted to the construction of the leaching plant. Much work upon the development of leaching process is in progress throughout the metallurgical world, and results elsewhere will be awaited with interest. The increase in extraction that will be the result of the application of leaching and flotation to copper is an application of true conservation of our mineral resources, and merits heartiest approval.

Tariff Changes and the Metals

When the new tariff bill was made public the generally expressed belief was to the effect that the lowered duties on iron ore would benefit the independent producer rather than the Steel Corporation. More careful study of the bill discloses the fact that its provisions are not all favorable for the independents, as the present duty of $2.50 per ton on ferromanganese is increased to 15 per cent *ad valorem*, or $8 to $9 per ton. Practically all the ferromanganese produced in this country is manufactured and consumed by the United States Steel Corporation, so that the increased duty makes little difference to the Corporation, though a matter of moment to the independents. The imports of ferromanganese in 1911 were 80,263 tons, valued at $3,015,062. Manganese ore, of which considerable quantities are imported, remains on the free list, and the natural result of the new tariff, if it be enacted, will be to stimulate the output of ferromanganese. So far as the steel industry is concerned, the Underwood bill seems likely rather to stimulate American industry than to decrease it. In general, iron and steel men seem less worried over the impending changes than had been anticipated. Present business is good and the country is prosperous. Adjustments are expected to be made slowly. This year American furnaces will produce nearly half the world's total of pig iron. Since local consumption is about 10 per cent less, a substantial tonnage must be marketed abroad, and in order to do this American mills must be able, as they are, to compete with foreign manufacturers in neutral markets. This being so, it is hardly to be anticipated that foreign iron and steel makers will be able to make serious inroads on our home market. Iron and steel will be brought in, but the total amounts will be small in proportion to the tonnage manufactured and sold in the United States. To the extent that Americans buy iron and steel abroad, they will help raise foreign prices, and American manufacturers have now a large and growing stake in the foreign market. At present American furnaces are running nearly to capacity, but periodically the demand slacks off and many go out of blast. The iron and steel industry of the United States has shown great powers of adjustment. It is hardly likely that the new tariff bill will call for any greater change than that made in the years 1910 and 1911. If by large participation in the world's markets a greater share in the making of these periodical adjustments be passed to European iron and steel makers, the local industry will be helped rather than harmed.

Metal tariff changes of especial interest in the West relate mainly to lead, zinc, and antimony. Decreases in the case of all three are proposed in the bill pending. The reduction on pig lead will amount to approximately 60 per cent, and on lead ore a trifle more. Spelter rates are reduced about 50 to 60 per cent and antimony about 60. Closer figures cannot be given because, coincident with the reduction, there is a change from the specific to the *ad valorem* basis. It is anticipated by metal dealers that the new rates will cause retention in this country of lead smelted from foreign ores when lead sells at $4.15 and will permit importation of spelter or retention of metal made from foreign zinc ores at about the present prevailing prices. As to antimony, merely the matter of revenue alone need be considered, since domestic production is unimportant. The *ad valorem* basis avoids some causes for controversy, such as those relating to tariff on lead in zinc ores, but raises others, since the true value at the point of importation is not easily fixed. It is contended that the changes will lead to lower prices for ores and that there is not sufficient 'spread' between ore and metal rates, but it is impossible to be certain of results in advance.

Gold and Commodity Prices

Recent Treasury reports, as interpreted by the *Wall Street Journal*, indicate that the increase of gold circulation per capita, which was rapid in the twelve years from 1896 to 1908, rising from $21.44 in 1896 to $34.72 in 1908, has practically come to an end.

The following table gives a bird's-eye view of the total money in circulation, the monetary stock in gold (including both that in the Treasury and that in use) and the circulation per capita:

MONETARY STOCK OF THE UNITED STATES

April 1,	Total circulation.	Gold stock.	Circulation per capita.
1913	$3,339,898,947	$1,858,569,894	$34.46
June 30,			
1912	3,276,786,613	1,813,499,440	34.26
1911	3,214,002,596	1,753,134,114	34.20
1910	3,102,355,605	1,635,424,513	34.33
1908	3,038,015,488	1,615,140,575	34.72
1905	2,587,882,653	1,357,881,186	31.08
1900	2,055,150,998	1,034,439,264	26.93
1896	1,506,434,966	599,597,964	21.44

It will be seen that the increase in gold stock has scarcely kept pace with the increase in population. At the present rate of population increase in the United States, the amount of new currency annually required to maintain a circulation of $34 per capita is $51,000,000. The annual production of gold is now about $470,000,000. Allowing $120,000,000 for use in the arts and $100,000,000 for exports to India, there is left $200,000,000 to be added to the gold stock of the principal countries. The gold reservations in London for India amounted to £3,475,000 in the period January 1 to April 10, or over one-fourth of the arrivals in London in the same period. In securing one-fourth of the $200,000,000 available for European and South American countries, the United States is at least getting its share. That commodity prices have continued to increase while the per capita circulation remains stationary is, in the view of the *Journal*, explained by the fact that the stimulus given to production and to the extension of industrial equipment during the period of rapid monetary expansion tended for a time to continue from its own momentum, and is at last being checked only by the fact that the expansion of credit has reached the limit of gold reserves and cannot go further without invoking a repetition of the monetary stringency which has recently been felt so acutely all over the world.

Continuous Agitation at the West End Mill, Tonopah

By Jay A. Carpenter

Pachuca vats have been synonymous in technical literature with continuous agitation. Perhaps this is not so much due to the special adaptability of the Pachuca to continuous agitation as to the fact that the endeavor to find a more satisfactory method of agitation led to the introduction into common milling practice of the Pachuca vat, and continuous agitation at nearly the same time. The Pachucas have been sharply criticized for the large initial cost for a given capacity, and for their awkward height, which prevents either gravity flow into them, or a symmetrical design of a mill building to contain them. Their simplicity of operation is without dispute, but the statements of low power consumption have been sharply questioned. Continuous agitation has been called a fad, and in several cases tried and abandoned. Still the fact remains that companies such as the Santa Gertrudis and Tonopah Belmont, with ample capital and with the best of engineering talent, employ Pachucas with continuous agitation in their modern mills. It is evident from the study of the files of the technical magazines, that the unstinted praise given to the Pachuca in 1910 and 1911 has gradually changed to the sentiment that it holds its supremacy, not through its vastly superior work, but from the fact that no one of the many less costly types of agitators has as yet proved to the general satisfaction that under varied conditions it is the equal of the Pachuca for reliability and low operating costs.

Classification of Agitators

The agitators in use may be classified as follows, giving a well known example of each type.

1. Using a cone-bottomed vat, the motive power being: (*a*) compressed air, the standard Pachuca and the variations from it; (*b*) solution under pressure, the Patterson hydraulic agitator; (*c*) mechanical appliance, the Hendryx.

2. Using a flat-bottomed vat, the motive power being: (*a*) compressed air, the Parral; (*b*) solution under pressure, the Trent; (*c*) mechanical appliance, the old arm agitator; (*d*) mechanical appliance and compressed air, the Dorr agitator.

The variations from the standard Pachuca consist in using lower and wider vats with a flatter cone bottom. The higher first cost of the standard Pachuca is thus reduced, but it is an open question if at the same time the best features are not minimized. However, such an eminent authority as Philip Argall speaks very highly of this type of agitator in use at the Independence mill, at Victor, Colorado. In the hydraulic agitator, the form is the same as with the Pachuca, but solution under pressure from pumps is substituted for compressed air. This type is in successful use at the Portland mill at Cripple Creek, but like many other types of agitators convincing data are not presented by those who sing its praises. The Hendryx, using a mechanical device where the above two use air and solution, gives excellent agitation, but is handicapped by the small units used, and high power costs.

In all of the above, a form of vat is used that is more costly to buy and install than the flat-bottomed ones used in the other forms.

The Parral vat is an adaptation of the Pachuca air-lift principle to a flat-bottomed vat. It has much to commend it in cheapness of first cost and low cost for power and repairs, but to the average millman, it does not seem that the rotary action is positive enough to guarantee successful agitation under the varying conditions to be met with in practice. The Trent agitator is an adaptation of a form of hydraulic agitation to a flat-bottomed vat. The action is more positive than in the Parral, and although simple in design there are many wearing parts and the agitator requires careful attention to details to get successful results. Its apparent simplicity of operation and cheapness of first cost has won at many mills, but the fact that it has been abandoned in several cases shows that its simplicity is more apparent than real. The old style arm agitator that was abandoned in such haste for the newer designs is being returned to in a few cases as an old and reliable friend. Its efficiency has been increased by the addition of air lifts on the periphery, and it is probable that in new plants where the speed of the arms is reduced with the idea of depending partly on the air lifts for additional agitation, it is no longer to be sharply criticized for its power consumption. The Dorr agitator carries the change in the old arm agitator one point further by using the slanting arms of the Dorr thickener moving at a faster speed than in the thickener for the arm agitation, but depending to a greater extent upon the air lift which is centrally placed and fed somewhat thickened pulp by the arms. This type has won upon its apparent merits at several plants, the results of which are awaited with much interest.

Requirements for Continuous Agitation

Only part of the agitators mentioned above are well adapted for continuous work. For such work the pulp should be nearly the same specific gravity and the slime of the same screen test at all points in the vat, and the currents in the latter set up by the agitation should be of such a nature that they will aid in insuring the new pulp a definite length of time in the agitator before any part of it reaches the outlet. The standard Pachuca, when it is given from 75 to 100 cu. ft. of free air per minute at 30 lb. pressure, probably best fulfils these conditions. Cases can be cited in which it was necessary to increase the air to this amount before continuous agitation could be made a success. The variations from the Pachuca cannot be well adapted to continuous work.

The old style arm agitators, with the aid of peripheral air lifts, are in successful use for continuous agitation at the old Belmont mill in the Tonopah district, yet the same method was tried and discon-

tinued at its neighbor, the Desert mill of the Tonopah Mining Co. Why such opposite results should be obtained is difficult to understand. An accurate description of this method of continuous agitation at the Belmont would be of great interest.

The Parral and Trent agitators can both be used successfully for continuous agitation, providing, as in the Pachuca, that sufficient power be used to give the proper conditions in the vat. Bernard MacDonald has thus operated the Parral alongside the Pachuca, claiming for it a better extraction with less power consumption. It is unfortunate that with such an excellent opportunity for comparison, and with the excellent detail so ably presented by Mr. MacDonald, he did not use a more accurate method of measuring the air consumption than by comparing valve openings. From the description of the Dorr agitator, it would appear well adapted for continuous agitation if sufficient air be used. As to the Trent agitator, it is the purpose of this article to describe a successful installation with continuous agitation.

Each Has Its Place

In fairness to all these agitators, it may be said that each may be best adapted to some special ore and particular operating conditions, and since they are rarely found working under exactly the same conditions, and when they are these conditions may favor one of them, it would seem that the millman should not base his conclusions too much upon his own personal experience. There is a lamentable lack of accurate and detailed data upon the use of these various agitators. In searching the files of the technical journals for such data, one finds many general conclusions expressed upon the subject, or just enough data to make it easily possible to draw wrong conclusions. It is the purpose of this article to go into careful detail concerning the operation of one of these agitators, the Trent, with the hope that it will lead to a discussion of the subject of slime agitation based upon accurate data. Since the Trent is doing excellent work in many mills, and in others it has been thrown out, it is an appropriate subject for such an article.

The Trent agitator was invented by L. C. Trent of Los Angeles, modified from the overfeed to the underfeed type at the Montgomery-Shoshone mill at Rhyolite, Nevada, and brought into prominence by its successful operation at the Tonopah Extension mill, where the necessary changes and details of operation were worked out under the direction of the mill superintendent, J. P. Montague.

The principal features of this agitator are perhaps sufficiently familiar. The solution is agitated by means of a centrifugal pump delivering to a revolving arm agitator in the bottom of the vat through a submerged grit-proof bearing in an air-sealed chamber and with provision made for the small amount of slime pulp escaping downward through the joint, to flow out into the vat through the ports without rising up in the ball-race chamber. The bearings consist of the top and bottom castings. The bottom casting is provided with a renewable ball race and a ring to hold down the top casting in case it tends to rise. The top casting is one solid piece provided with a head into which are screwed the arms and upon which is bolted the mast. The method of operation is simplicity itself.

Importance of Pump

The centrifugal pump, which is not furnished with the agitator, should be considered an integral part of it, for the choice and operation of the pump has had more to do with the success and failure of the agitator than the agitating device itself. Upon the pump mainly depends the power consumption, the cost of renewals and repairs, and the behavior of the agitating device. To make the installation a success, the pump must be able to handle a gritty pulp day in and day out without undue wear, attention, or power consumption. The use of centrifugal pumps for transferring slime pulp from the bottom of cone-bottomed vats to the top was abandoned as a method of agitation, because of the power and repair costs. With this in mind, it was the intention of the inventor of the Trent agitator that the pump used on the agitator should only pump the nearly clear solution from the top of the agitator, thus avoiding the wear on the pump. This entails operating the agitator so that the pulp shall be thick on the bottom and thin on top. With the centrifugal pump made with chilled iron or manganese steel liners and runners and operated at a comparatively slow speed, it has been found that the wear on the pumps is only nominal, and that this fact in the case of the Trent agitator makes it advisable to pump a large volume of slime pulp, which, although it causes somewhat greater wear and greater power consumption, keeps the tank of nearly the same specific gravity top and bottom, thus giving a more thorough agitation and preventing the chance for quick settling of heavy pulp on a shut-down, making starting difficult or impossible.

There are many standard makes of pump not adapted to this work, either because of the speed necessary with the runner used, or of the wear and cost of the rather intricate repair parts. Again, the same make of pump will give varying results at different plants, due to the speed at which it is driven, or to the number or size of nozzles on the agitator.

Why Wear Varies

A study of the table, 'Average Performance of a Centrifugal Pump,' on page 886 of the 'American Civil Engineers' Pocket Book,' will aid in understanding why the power used and the wear on the pump varies so greatly at different plants employing the Trent agitator. This table is based on the fact that for a given centrifugal pump there is one speed against one head that gives the maximum efficiency, and that as this head is increased or decreased, the volume pumped decreases or increases, but the efficiency decreases rapidly in both cases. This decrease is due mainly to the slippage of the pulp in both cases, which increases the wear.

In the Trent agitator, the pulp must issue from the nozzles with sufficient force to cause the arms to turn. With a given pump running at a fixed speed, the area of the nozzles determines the head or pressure against which the pump works. By chance this

may just coincide with the maximum efficiency of the pump for the given speed, in which case the Trent agitator will be praised for its low power consumption. If the pump is working against only 50% of the correct head for the driven speed, its efficiency is but 66% of the best conditions, or if it is pumping against a 40% greater head, its efficiency is likewise only 48% of the best conditions. Since the efficiency of a centrifugal pump at its best performance is relatively low, such a drop as those indicated above make the pump an inefficient machine. Perhaps this partly explains the widely varying published figures of the horse-power consumption of Trent agitators. These range from the Goldfield Consolidated figures of 7½ hp. for 200 tons dry slime in a 1½:1 pulp, to the Hollinger figures, as given by Herbert Megraw, of as high as 18 hp. for a vat of 30 ft. diameter and 15 ft. high, filled with pulp heavier than 3:1, and probably containing 110 to 140 tons of dry slime.

Number and Size of Nozzles

When the agitator is revolving in good running condition, that is, revolving freely on the ball race when spun around in the empty tank, and all nozzles cleaned, it may be turned readily by hand when filled with pulp over the arms, showing that the force at the nozzles required to turn it must be small. It should continue to turn easily as long as enough pulp is introduced through the nozzles to counteract the natural tendency of the slime to settle, and with sufficient velocity to turn the agitator. Since the number and size of the nozzles plays such an important part in determining the head against which the pump works and the volume pumped, it is evident that a change in the size of the nozzle openings will play an important part in increasing or decreasing the efficiency of the pump. For instance, if a pump at a given speed is not turning the agitator fast enough, instead of running the pump faster to increase the agitator speed it is quite possible to obtain the same result by removing a part of the nozzles from the nipples, or increasing each nozzle area. Possibly the correction may be made the opposite way, by decreasing the size of the nozzles, depending upon whether for the greater speed of the pump head should be less or greater to get the maximum efficiency. At the Tonopah Extension, for an experiment, the agitators were run for a few weeks without nozzles at all, the greater volume pumped making up for the lower pressure and effecting the same result.

When the agitator is driven at a speed of about 3 r.p.m. by a slime pump working under an economical speed and head, it will successfully agitate week in and week out without any trouble or repairs, a slime pulp from 1.16 to 1.30 specific gravity with the slime varying from 60% through 200 mesh, to 90%, as long as the pulp does not contain wads of waste and wood pulp, broken bottles, tin cans, or other such material. Such an agitator can be stopped for several hours and started without trouble when working on thin pulp and coarse slime, and for a day or more when on thick pulp and fine slime.

A Few Difficulties

The following remarks concerning the operation, wear, and repair on this type of agitator are the result of watching the operation in several other mills, talking with operators from other districts, and of operating them for eighteen months in the milll under my charge. Having in the first few months often poked with a long stick at the mast and fished with a grab hook for the arms in a vain effort to make the agitator turn, and having waded in slime pulp pushing on the arms, I agreed with Whitman Symmes that the agitator hardly justified the effusive statement of the inventor, that with it "cyaniding, formerly a complex nightmare, becomes a delightful experience," but I am now sure that if the proper study and care be given the agitator, such performances are unnecessary and it will give service as satisfactory as the Pachuca.

The most frequent complaint against the agitator is the stopping of the nozzles by waste material. Since this same material gives trouble, but to a less degree, in launders, pipes, cones, thickeners, and pumps, it should be screened out at every available place; such as at the end of the classifiers, in the launders, over the tops of cones, and settlers. If this precaution be taken, with footboards on all walks, and the millmen interested in the subject, this complaint will be of minor importance.

Wear of Ball Race

The wear on the noozles and pipe arms is next to nothing, but the ball race will wear in spite of its protection. This wear varies greatly, depending on the amount of slime reaching it, which in turn depends upon how smoothly the agitator is operating. If the escape parts in the bottom casting become choked with settler slime, and a sudden jolt of air be given the agitator, or the agitator wobbles as a result of choked nozzles, then an extra amount of pulp passing the joint may flow over the ball race. The balls running in slime cut both the top and bottom race about equally and wear down in size. Since the clearance is made entirely too small on the original castings, the ball race of the upper casting may soon be rubbing on that of the lower casting, and the friction generated will gradually slow and finally stop the agitator. The remedy for this is to raise the top casting and chisel down the edges of the lower ball race, which can be done in an hours time, insuring at the West End mill several months run before repeating. The ball race in both the top and bottom castings should be made separate to be easily renewable. However, it will not be necessary to machine the castings and fit in new races until after two years or more of wear.

Another source of trouble met when an excess of air is suddenly applied or the pumps started with the nozzles pointed too steeply toward the bottom, is that the top casting rises and shifts so that the casting is suspended or hung up on the joint. The quickest way to right it is to empty the tank. In one case, to my knowledge, a raft was built and launched upon the cyanide sea in a vain attempt to right the submarine. In the latest designs a holding down ring prevents this distressing accident. In

the older type, J. W. Harcourt, master mechanic at the Desert mill, prevented this occurrence by extending the joint to 4 inches in length. Before the top could rise this high, it would bind on the joint and settle back in place as soon as the pressure was relieved. This joint should also be made with two removable bushings so that they could be easily replaced after a couple of years service, when the small stream of pulp has cut them enough to allow too large a stream of pulp to escape for the parts to handle. The expense and labor of inserting two each of the new cast iron ball-race rings and bushings would be but a small item and would make the agitator as good as new. A set of balls will wear from one to two years, and as they grow smaller, the race should be kept filled by addition of balls of a size.

Starting the Agitator

If, after a power shut-down, or pump repairs, the agitator fails to turn, it is due to the accumulation of thick pulp or sandy material back of the arms where the nozzle streams cannot reach them. Often starting the pump several times or rocking the mast will aid the arms to pass over or through this mud, and the nozzle then cuts it away, or a grab-hook caught on one of the arms and carried around a half turn may be used. Where the platform runs over the centre of the tank, as at the Rawhide mill, the men easily turn the agitator by hand power, turning opposite the usual direction of rotation, which causes the nozzles to clean the bottom of the tank in advance of the arms. After a part of the turn, the agitator, upon release of pressure, will reverse and the arms will then rotate freely and there will be no more trouble.

Gaining by Experience

In the first few months of operation at the West End mill, many of these troubles were met, but we had the advantage of our neighbor's experience, and at the end of six months the agitators were running so smoothly and with so little attention needed, that I devised a simple and effective method of continuous agitation and put it in operation. The essentials of this system are: (1) that the pulp be drawn from each tank of equal specific gravity and fineness as to that which enters the vat, in order that there will be no gradual accumulation of thick or coarse pulp; (2) that the chance for a quick passage of new slime through any one of the agitators into the next of the series be reduced to a minimum.

With the Pachuca, the average agitation given for continuous work is sufficient to keep all parts of the tank of the same specific gravity. The greatest trouble with its rapidly moving centre column of pulp the danger of carrying new pulp to the next vat, with but a short contact. After considerable discussion of this subject, the general conclusion seems to have been that this danger became of little consequence when 8 to 10 agitators were used continuously.

A Record of Tests

Tests upon the Trent agitators before installing continuous agitation, showed the following specific gravity and screen tests:

Record of Test on Trent Agitator

Depth of sample, feet.	No. 220, 90% through 200.	No. 222, 2 hr. agitation after 4 hr. shut-down.
4	1.208—1.190	1.242
9	1.192—1.208	1.240
15	1.206—1.208	1.242

On No. 220, 500 c.c. of pulp was screened through 200 mesh.

4	ft. gave	27¾	gr. on	200 mesh
9	"	27	"	"
15	"	28¼	"	"

There being as great differences between samples at the same depth as at different depths in the agitator, it was evident the agitation was as thorough as that of the Pachuca.

Having but four agitators, the second point was of great importance. Observations were made to determine the currents set up in the agitator. There seemed to be no definite rotary current, probably due to the fact that the arms moving in an opposite direction to the nozzle streams destroyed all currents. There was no rising current at the side of the vat, probably due to the force of the nozzle streams being exhausted before they had reached the side. It was evident that pulp delivered evenly to the bottom of the vat would not be subject to the action of currents bringing portions of it quickly to the surface.

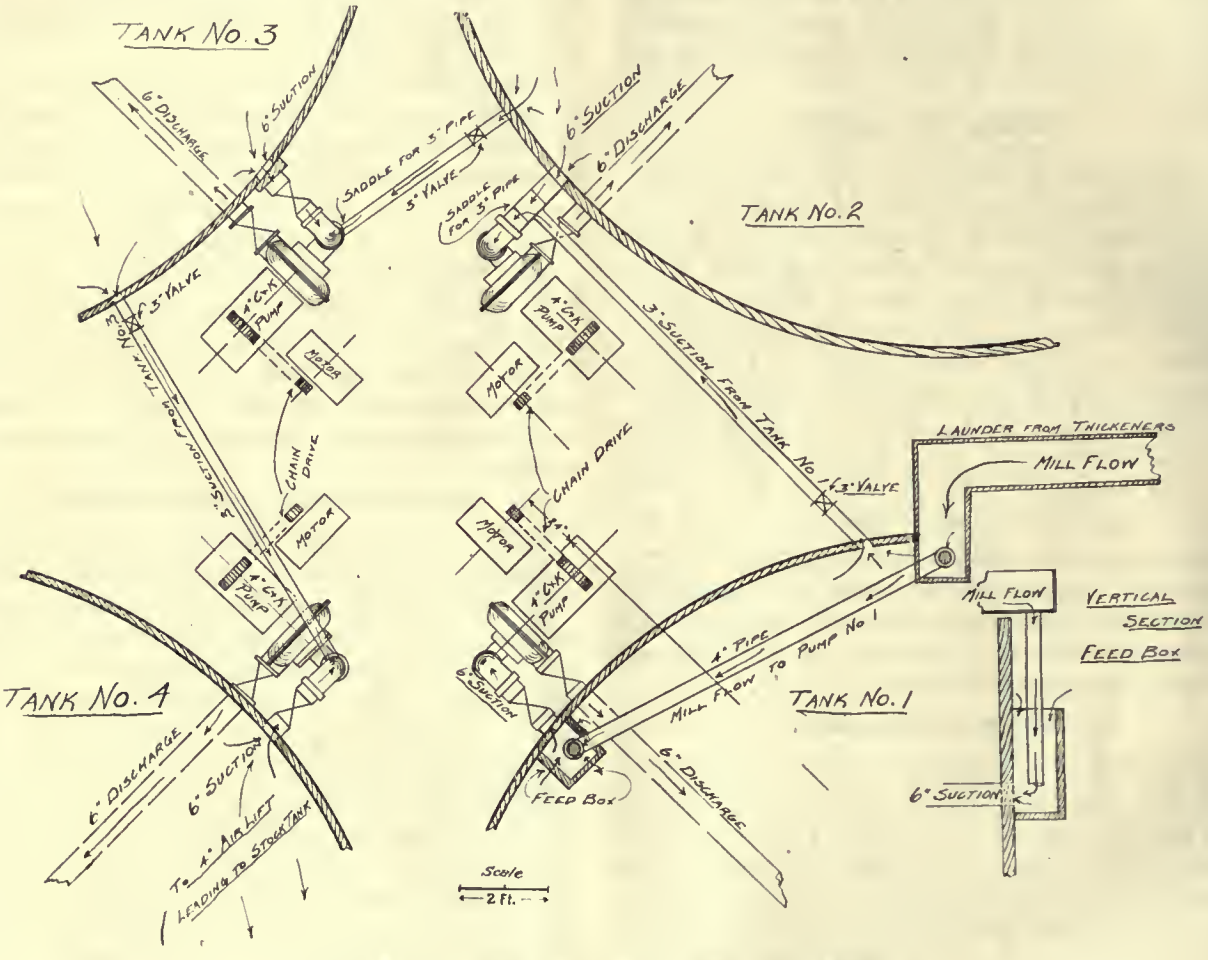
Arrangement for Continuous Work

Since the total pulp in the Trent agitator is not handled but once in three hours by the pump, it was evident that if the new pulp could be introduced in the pump suction and thus distributed over the bottom of the vat and the old pulp withdrawn at the top of the vat there would be little likelihood of any new pulp short circuiting through the vat. The accompanying illustration shows how this is done, using the agitator pumps as the means of transfer. The pulp from the crushing department is lifted from the bottom of Dorr thickeners by diaphragm pumps into a launder which delivers it at the edge of agitator No. 1 into a 4-in. pipe, which in turn delivers it to the bottom of a box over the suction of the pump. Since this is but a part of the pulp necessary to feed the pump, it is all drawn into the suction pipe by the current of pulp flowing into the box from the top of the vat.

The 6-in. pump suction of agitator No. 2 has a branch 3-in. suction to agitator No. 1 entering it at 3½ ft. from the top. Through this suction it draws pulp from No. 1 agitator fast enough to keep No. 2 level with No. 1, and if the flow into No. 1 is stopped. No. 2 will build up to 4 in. higher than No. 1. The pulp from No. 1 thus is distributed over the bottom of No. 2 tank and must rise nearly to the top of the vat to pass into the branch suction of No. 3 pump, thence to the bottom of No. 3 vat. Practically the only regulation required for this continuous system is that of the air lift taking the pulp from No. 4 agitator to the large Dorr thickener. In the design of the mill the thickener floor being limited, sufficient agitators were installed so that each agitator in turn was used as a collector until filled, agitating the pulp meanwhile. By changing to the continuous

system, the present 150 tons daily capacity of the mill is given 54 hours continuous agitation, whereas the 120 tons under the charge system received 58 hours.

After operating the continuous system for a year's time it was found that after two to three months of steady running the mast of about one of the four agitators would begin to describe a small circle, showing that part of the nozzles are choked. This does not mean that it needs immediate attention. When convenient an extra filter charge is run, making room to transfer No. 4 agitator to the large Dorr thickener. A rope is stretched across the vat and the top



ARRANGEMENT OF TRENT AGITATOR FOR CONTINUOUS WORK.

casting is raised by chain-block high enough to expose the ball race. The nozzles are looked into and cleaned, the ball race washed out if slimy, and additional balls added, and the race chipped if necessary. Then No. 3 is transferred to No. 4, partly by gravity through common suction to the transfer pump, and No. 3 given the same attention. Then 2 to 3 and 1 to 2, and then No. 1 is allowed to fill. The arm needing attention the worst will be found with many of the nozzles choked, and often most of the nozzles choked will be on one arm, which has caused the wobbling of the mast. The bottom of the vat needs no attention whatever, as there is no settlement of slime or sand. It takes about 10 to 16 hours to go around the circuit; about half the time is taken by the mechanic for his inspection and work, the rest being taken for transferring. The labor of transferring and inspection at such periods is small compared with the weeks of steady work insured.

The assumption upon which the Trent agitator was placed in the mill in preference to the standard Pachuca was that although it would cost more to operate, it would require three years of operation before the extra expense added to the original cost would equal the capital outlay for Pachucas. The comparison of cost was based upon figures of costs for the Pachucas at the Goldfield Consolidated and for Trent agitators elsewhere, with a liberal allowance for the power and maintenance cost of the Trent. After two years' experience I believe this statement is nearly correct. The cost of the Pachuca vats is now lower than at any time, but the cost of operating and maintaining the Trents is lower than was estimated. The comparison of cost is as follows:

Trent Agitators (f.o.b. Tonopah)	
Four 24 by 18-ft redwood tanks, each 7000-cu. ft. capacity	$2120
Four Trent agitators with piping	2041
Four 10-hp. motors	760
Four 4-in. C. & K. pumps	720
Four 10-hp. chain drives	140
One air-compressor for 80 cu. ft. at 20 lb., with 10-hp. motor	400
Erection	500
Total	$6684
Pachuca Vats	
Four 15 by 45-ft. Pachucas, 6800 cu. ft. each, weight 29,000 lb., $883 each f.o.b. Milwaukee	$3532
Freight to Tonopah, $573 each	2292
Erection at estimate of 2c. per lb	2320
Air-compressor for 320 cu. ft. of air at 30 lb., with motor, erected	1500
Total	$9644

The cost of operating the Pachucas at 6.5 hp. per vat, I believe is moderate, especially since this is nearly the minimum figure based on 80 cu. ft. free air at 30 pounds.

Power Consumption

After 18 months the cost of operating the Trent agitator is found to be as follows: With the agitators filled with the average charge of 88 tons of ore in a 1.25 specific gravity pulp, the horse-power consumed by the 10-hp. motors, being the horse-power input taken with a polyphase wattmeter, was 6.8, 5.9, 6.8, and 6.5 hp. respectively, or an average of 6.5. This reading includes all motor and transmission losses. Power data as given by the technical press are generally published without giving the method by which they were figured. Often the millman bases his figures on whether the given motor runs cold or hot, irrespective of the fact that motors vary so greatly as to make this method a joke. Also, very often, the assumption is made that a 10-hp. motor takes 10 hp. when running full load, while a wattmeter will show considerable excess, depending on the motor efficiency. Others who take a wattmeter reading, figure the horse-power consumed by a unit, such as the Trent agitator or a compressor for Pachuca work, as the horse-power delivered by the motor, thus deducting motor losses as a separate item. Others, over-zealous people, may figure the transmission loss as a separate item. The air used by the agitators amounts to 80 to 100 cu. ft. piston displacement at 16 lb., estimated at a total consumption of 6 hp. This makes the total consumption for each agitator 8 horse-power.

Pump Repairs

The cost of maintenance for the agitators also has been less, due to a choice of Campbell & Kelly pumps; for the greatest item of maintenance is in the repair of pumps. This pump, made at the local foundry and machine shop, has an enviable record for service and has replaced many pumps of standard makes in this district. Its advantages are in the ease with which repairs or changes can be made to any part, in the simplicity of design, and the durability of the wearing parts. Our records show that the pump on No. 2 agitator was started September 20, and ran practically 24 hours per day until June 20, 9 months, without a repair or any mechanic's time. At that time it required a new shaft and runner, and on October 1, over a year, it required a new liner for the shell. The average life of the repair parts necessary, has been a new shell liner every 10 months, a runner and shaft every 6 months, and the main bearing re-babbitted every 6 months, the wear on shafts and bearings being due to slime in the solution fed to the packing gland. The yearly cost for these repairs is $50 for materials, and $18 for labor. Renewals for chain drives and agitator parts, with all labor for maintenance, added to the $68 for the pumps bring the total for maintenance and repairs for each agitator to about $100 per year. The maintenance cost of the Pachuca system complete would easily total $60. For the four units the power consumption is 6 hp. greater than for Pachucas, or $630 per year. The cost of maintenance is $340 greater. On this basis the Trents would cost $970 per year more to maintain and operate, but the installation would be $2900 less, or nearly the amount of three years' operating costs.

Accurate comparison of the two agitators as to extraction and cyanide consumption is impossible in this case. However, the perfect aeration of the Trent has much in its favor, the air being minutely subdivided and slowly rising through the charge. The blanket of foam on the vat acts as a nonconductor, preventing radiation from the heated pulp, in sharp contrast to the centre column of the Pachuca. With the continuous system on the coldest days there is no mist over the agitators. When solutions are heated to 90 to 120°F., the absorption and radiation of heat by compressed air becomes an important consideration. Since the extra cost of the operation of Trent agitators above Pachucas, in our case, amounts to less than 2c. per ton, it is probably easily paid back in extra extraction and heat saving.

In Other Mills

The description above of the satisfactory work of Trent agitators is by no means an isolated case, for in Tonopah alone, the Tonopah Extension and the MacNamara mills, while not attempting continuous agitation, obtain equally and in some particulars better results with these agitators. At the Extension mill, the superintendent, J. P. Montague, gives the motor horse-power as 6, and the air consumption as 25 cu. ft. of free air at 18 lb. for the 24 by 16-ft. agitators. He has discarded the round nozzles for flattened nipples which allow waste materials to pass through more readily. Shell liners and runners last six to eight months, and shafts and bearings, due to using water on the packing glands, last over a year.

At the MacNamara mill, the superintendent, J. B. Tregloan, gives the following figures: A charge containing 97 tons of ore is agitated with a total of 9.5 hp. A charge of 1.26 specific gravity, with the slime screening but 70% through 200 mesh will not vary over 0.01 in specific gravity between top and bottom, and screen test within 5% through 200 mesh. At this mill the ore is almost entirely pure quartz without kaolin, and the sulphides show no oxidation. The ore has a specific gravity of 2.64 and the pulp is white in appearance and contains a small amount of colloid as distinguished from fine crystalline matter. In spite of the quick settling of this ore, these agitators have been stopped for days and started in a few minutes. There are other installations of Trent agitators in the Tonopah district that often grow weary and stop for the lack of a kind word. When Trent agitators give results as satisfactory as in the three mills mentioned above, they surely compare favorably with the standard Pachuca. On the average millsite they will reduce the costs over a Pachuca installation in (1) the excavation and concrete work on the millsite, (2) the building cost to cover them, and (3) the outlay to buy and install them. The small extra cost per ton to operate them is probably balanced by the saving in chemicals, heat, and elevating costs. When properly erected and operated they closely approach the Pachuca in its best feature, that of reliability of operation.

Who Sells the Copper

Agencies for selling copper usually handle the metal from several concerns. As the business is profitable, it is much sought, and changes are frequent. The most recent list, based upon pounds handled last year, and compiled by the *Boston News Bureau*, is given below:

UNITED METALS SELLING CO.

	Pounds.
Anaconda and North Butte	294,000,000
Lake Mines (Copper Range)	40,000,000
Arizona Copper Co	38,670,000
Utah Consolidated Mining Co	8,000,000
Greene-Cananea	48,346,000
Giroux	3,768,000
Pennsylvania Salt Mfg. Co	6,000,000

The leading metal concerns of Europe have representatives in New York who buy copper in large quantities direct from producers or selling agencies. Notwithstanding this fact the leading American producers and selling agencies have their own representatives in the various European markets. In London, C. S. Henry & Co. represent the Amalgamated Copper Co., Henry R. Merton & Co. the American Metal Co., while L. Vogelstein & Co., Phelps, Dodge & Co., and the American Smelting & Refining Co. also have men on the spot. Aron Hirsch & Sohn of Germany have close affiliations with L. Vogelstein & Co. and are represented throughout Europe; in addition they see much Australian copper.

Available Alkalinity of Lime

*The sample as delivered for analysis is contained in an air-tight vessel, having been passed through a 30-mesh sieve. It is crushed with a Wedgwood mortar and pestle, and the whole passed through a 60-mesh sieve, this operation being performed as quickly as possible. It is then placed in a clean, dry, wide-mouthed bottle fitted with a tight-fitting dry glass stopper so as to prevent any access of air. Two grams of the sample is carefully weighed out and agitated with 1 litre of a 2% cane-sugar solution (or 1 gm. with ½ litre of 2% sugar solution). If a shaking machine be available, 2 hours continuous agitation should be given, if not, 6 hours intermittent agitation, every care being taken to prevent coagulation of the lime, in order that the lime and solution may be brought into the most intimate contact during this period. When the agitation is finished the solution is filtered as quickly as possible, and aliquot portions titrated with N/10 or N/5 acid, using rosolic acid as indicator, avoiding delay so as to obviate undue exposure to the atmosphere. The distilled water used in the above determination must be made neutral to rosolic acid to counteract the presence of dissolved CO_2.

*Abstract from report of South African Engineering Standards' Committee.

Cleaning-Up at a Nome Hydraulic Mine

By C. W. Purington

*Cleaning-up at the hydraulic plant of the Pioneer Mining Co. on No. 1 and No. 2 Below Specimen on Anvil creek at Nome, offers some interesting variations on usual practice as a result of the use of steel sluice-boxes.

The use of these, both in the bedrock line leading to the elevator pit and in the tail sluice, has increased the efficiency of the plant over that at Glacier creek in 1904. The difficulty which was then experienced in getting the gravel from the face to the sump no longer exists, as it slides easily in the steel boxes used without riffles, to the elevator throat.

PREPARING TO CLEAN-UP. CLEAN-UP AT No. 2 BELOW.

The boxes are made so as to fit into each other with a lap of 2 in. and are bolted together, with one bolt on each side. The usual size is 24 in. wide on the bottom, flared to 30 in. across the top, made of one bent sheet of ¼-in. steel, 10 ft. long.

No attempt is made to save gold in the bedrock sluice. Should any concentrate remain in the elevator sump, after one operation is finished, it can always be shoveled from the bottom of the sump into the throat before the set-up is abandoned.

The tail-sluice is practically of the same construction as that described at the Glacier creek set up in my report of 1905.[1] The principal difference is in the use of the steel boxes, which are 30 in. wide on bottom and 37 on top. The head-box, in which the manganese steel hood is set, is of timber, as are the two succeeding boxes. The head-box is 12 ft. long by 30 in. wide and 3 ft. 6 in. high above the floor. It is strengthened by four yokes having 4 by 6-in caps and sills and 4 by 4-in. posts. The first two boxes, are set at a materially less grade than are those of the main string. The remainder of the sluice, 200 ft. long, is of steel. Riffles extend for the first 125 ft., the remainder of the boxes being clean. Riffles in the first boxes are wooden blocks, 12 by 12 by 8 in. high. They wear rapidly but are easily replaced. Riffles in the steel boxes are short sections of T-rail set in frames, 4 ft. 9 in. long by 11½ in. wide, with narrower sections on the side. They are so pinned together lengthwise that they cannot be lifted out except when starting from the upper end of the sluice. A steel bar, 31 in. long by 1 in. square is set between each two frames. Quicksilver is used in all the steel riffles, the wooden blocks in the upper boxes being kept free from it.

The main string of boxes is set on a grade of 5 in. to 12 ft., which is as low as can be used under present conditions. With this grade it is necessary to start piping the tailing soon after each set-up. As shown in the table printed last week, the tailing giant was at work 16 days and 17 hours, as compared with the piping giant for 21 days and 17 hours. The use of the tailing giant is not to be recommended if it can possibly be avoided. In future work in this locality it can probably be avoided almost entirely. If the hydraulic elevator itself represents a waste of water which has been obtained at great expense under pressure, the tailing giant is a much greater waste of this water.

A typical clean-up at the No. 2 Specimen operation started at 9 in the morning and was finished at noon-time. First, all the gravel surrounding the elevator throat which had caught in the crevices of the bedrock was carefully shoveled into the elevator and any rich gravel which might have caught in the

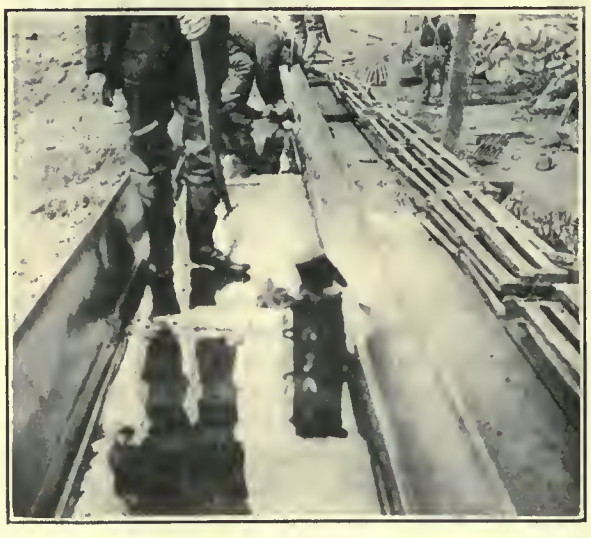
*For general description of operations and costs see *Mining and Scientific Press*, April 26.

[1]'Methods and Costs of Gravel and Placer Mining in Alaska,' Bull. 269, U. S. Geol. Survey.

vicinity of the throat was carefully collected in buckets. While the clean-up was going on, a little water was fed to the elevator, sufficient to clean the amalgam, while the heavy stones were being forked out. The photograph illustrates the clean-up and shows the amalgam in the bottom of the steel boxes. The amalgam is taken in buckets to the assay office at the mine, retorted, and sold as retorts to the bank.

A new set-up had already been made and sluice-boxes erected so that all that was necessary was

CLEANING-UP THE SLUICES.



CLEAN-UP, SHOWING STEEL SLUICE.

to break the pipe connections from the old set-up and join them to the new. It takes the work of two men for about four days to blast out the elevator pit in the bedrock. The dimensions of this pit are about 6 ft. square by 6 ft. deep. Generally 4 ft. in the clear must be allowed below the nozzle of the elevator in order to give room for placing the goose-neck. Formerly in the hydraulic elevator operations at Nome it was customary to use at least two small hydraulic pumps to help dispose of the excess water. Now the elevators have undergone so much improvement that one pump is sufficient, and sometimes even it is unnecessary.

Work of the Nevada Consolidated

By Pope Yeatman

*The mining area of the Nevada Consolidated Copper Co. during 1912 has been increased by acquiring the Watson No. 1, containing 2.9 acres and situated close to the Liberty pit. Rights for dumping privileges for overburden have also been obtained on portions of the Rex and Guptil claims, portions of Clipper, Clipper No. 2, and Fraction, a portion of Monarch Fraction, and a portion of Chispy and Quartette, having an area of 37.21 acres, and allowing for the disposal of two to three million cubic yards of overburden.

Prospecting and Ore Reserves

In addition to a large number of holes drilled for blasting purposes, in connection with the removal of overburden and mining of ore, 16 were drilled with a total footage of 5330 ft., in the Copper Flat area, and one 264 ft. deep in the Veteran area of the Cumberland-Ely ground—the latter for purposes of ventilation. The total number of holes drilled to date is 274, equaling 84,202 ft. These holes have shown more definitely the outlines of the deposit, and have proved more accurately the extent and grade of the orebody. While the lateral extent has been pretty well delimited, there is still some chance for development of additional ore at greater depth in places where the drill-holes have not been sunk quite deep enough. It is at the present time difficult to put these holes down on account of the surface having been disturbed by blasting in the preparation of the ground for removal of capping. As this is cleared off, more deep holes will be drilled. In the Cumberland-Ely some prospecting has been done in the west end. But little addition has been made to the ore reserves for the fiscal year. The estimate of ore developed and its assay value is as follows:

			Tons.	Cu, %.
Total to Dec. 31, 1911			49,410,087	1.70
Ore developed in 1912			600,000	1.59
			59,010,087	1.70
Unprofitable, account of slopes			1,419,300	1.21
Total profitable ore developed			48,590,787	1.71
Tons ore milled to Dec. 31, 1912	9,612,060	1.89%		
Tons of carbonate ore smelted to Dec. 31, 1912	125,176	2.99%		
			9,737,236	1.90
Profitable ore in reserve Dec. 31, 1912			38,853,551	1.67

Mining

Both mining by means of steam-shovel in the Eureka, Hecla, and Liberty pits, and underground mining in the Veteran mine have been carried out. The three pits are really in one orebody, the Hecla representing a narrower and poorer tongue of ore connecting the east and west portions of the orebody, the latter two having been determined first and the connection at a later period. As has been the case

*From annual report to the directors of the Nevada Consolidated Copper Company.

in the past, the Eureka furnished the largest tonnage. During the fiscal year the sulphide ore mined and shipped to the concentrator was as follows:

	Tons.	Cu, %.
Eureka pit	2,054,758	
Liberty pit	170,748	1.603
Hecla pit	371,485	
Veteran mine	253,365	2.605
	2,850,356	1.690

The ore mined was of lower grade than for the preceding year, due to the fact that ore from a greater depth, and therefore poorer, was mined in the Eureka pit, and also ore was mined for the first time from the Hecla area which is much lower grade than either of the other two. Siliceious carbonate ore, amounting to 88,428 dry tons and averaging 2.78% copper, was mined, of which 35,216 tons was crushed and delivered to the smelter and 53,212 was put into storage at the mine.

Stripping

Stripping of overburden has been done on the Copper Flat orebody in three areas in the following amounts:

	Cu. yd.
Eureka area	197,157
Liberty and Hecla areas	2,370,819
Liberty area	165,000
	2,732,976

With the exception of the grade slopes, all the overburden has been taken from the Eureka pit, but there still remains a considerable amount of stripping to be removed from the other two areas, or roughly as follows:

	Cu. yd.
Eureka area	640,743
Liberty and Hecla areas	9,275,281
	9,916,024

The total amount of stripping removed to January 1, 1913, is 8,771,659 cu. yd. The removal of the overburden is sufficiently advanced to easily allow an extraction of all the ore necessary for the requirements of the concentrator. Much the larger portion of the stripping to be removed lies in the grade slopes rather than directly above the orebody.

Costs

Including all charges of every description, such as labor, supplies, repairs, management, taxes, proportion of general and New York expenses, etc., the direct mining cost for Copper Flat ore has been 17.35c. per dry ton. This shows some increase over previous years, due mainly to the strike, which began in the latter part of September and caused a cessation of work in the mines until October 25. Even after this, it took some weeks before the force was again on a full working basis. Including redemption of stripping, the costs show a very decided increase, due to the fact that a considerable amount of ore was taken from the Liberty and Hecla pits, which entailed a greater cost to cover stripping redemption than in the case of the Eureka pit—the latter being 15c. per ton of ore, the Liberty 22c., and the Hecla 30c. Including Veteran ore, where the ore is mined underground, the total costs for mining were 33.04c. per dry ton. Stripping costs have been reduced to 33.64c. per cubic yard. The cost for mining carbonate ore was 68.8c. per dry ton, as compared to 74.4c. for the preceding year. One new Bucyrus steam-shovel and one 30-ton locomotive crane have been purchased. At the Star Pointer there have been built four 2-room houses and one bunkhouse; at Copper Flat small additions have been made to the Greek dwellings and to the storehouse, while one Greek boarding-house, two bunkhouses, and one new sand-house have been built. Eight thousand one hundred feet of permanent track for Ys, approaches, yards, and sidings have been laid, and 11,100 ft. of additional track for dumps. Transportation of ore from the mines to the Steptoe Valley plant has been most satisfactory, and even during the severe winter months there has been little or no delay.

Steptoe Valley Smelting & Mining Co.

Except for the occurrence of the sympathetic strike, the plant has worked successfully during the past year, and has shown improvement in all departments, considering the conditions under which it was operated. In addition to the treatment of Nevada Consolidated ore, 133,933 dry tons of ore from the Giroux Consolidated Mines Co. was concentrated and the concentrate smelted. A small amount of custom ore was also smelted. Though treating a lower grade of material, owing to improvements which had been foreshadowed in the last report, better extractions were obtained.

The following table shows by months the tonnages treated, assay of ore, percentage saved, and ratio of concentration:

	Jan.	Feb.	March.	April.	May.	June.	July.	August.	Sept.	*Oct.	Nov.	Dec.
Ore treated, dry tons	239,401	224,110	265,081	266,303	289,446	257,392	266,629	286,103	245,062	44,660	244,156	224,172
Copper assay, %	1.98	1.75	1.81	1.72	1.54	1.73	1.73	1.77	1.73	1.74	1.37	1.46
Recovery, %	68.09	66.49	69.80	69.01	69.97	69.16	68.17	66.89	67.24	69.45	66.06	69.21
Gold per ton, oz	0.020	0.016	0.015	0.015	0.013	0.016	0.020	0.020	0.018	0.020	0.013	0.011
Silver per ton, oz	0.061	0.036	0.044	0.048	0.040	0.039	0.073	0.055	0.054	0.055	0.048	0.031
Ratio of concentration	8.43	8.29	7.95	8.41	9.13	9.73	10.57	10.01	8.75	9.94	11.04	8.32
Copper in concentrate, %	11.34	9.65	10.02	10.00	9.86	11.63	12.44	11.87	10.15	12.03	10.03	8.42

*Low tonnage due to strike.

The results of the year 1912 were as follows:

Ore treated, dry tons	2,852,515
Copper assay, %	1.692
Copper extraction, %	68.25
Ratio of concentration	9.09
Gold content, oz	0.016
Silver content, oz	0.049
Gold extraction, %	45.84
Silver extraction, %	50.11
Average Au and Ag recovered per ton of ore	16.48
Average copper in concentrate, %	10.49

Smelting

Many improvements, all of which were charged to operation, were made in the roasters, by which

the capacity was increased from an average of 60 tons per furnace-day to 90 tons. Owing to this change, and to the building of new roaster-stack foundation, and also to the strike, the cost of roasting was increased 10.2c. per dry ton of concentrate over the previous period.

Great improvements were made in the reverberatories, and the capacity of the oil-fired furnaces was greatly increased. All furnaces are now fired by oil. The average amount smelted per furnace-day has been increased from 262 tons in the year 1911 to 371 tons for the year 1912. I am happy to say that during the latter part of the year even better work than the average shown above has been done. Changes of firing, improvement in design, and better operation have aided materially in increasing the capacity of the furnaces.

Additions have also been made in the converting department, and there are now two Pierce-Smith basic-lined converters, in which considerable improvement has been made in the way of operations. Owing to numerous changes, charged to operating costs, there has been no reduction in the cost of converting.

Improved efficieney and lower costs have been obtained in the power-house during 1912.

Quarters for Men at McGill

The foreign quarters at McGill have been materially added to in order to more conveniently take care of employees. A new staff annex building was constructed after the loss by fire of the old McGill homestead used as staff quarters. The approach of the slag dump on the lower townsite necessitated the removal of many buildings to new sites. After removal these buildings were remodeled and made more comfortable for the white employees. The old smelter fence was repaired and extended to completely enclose the smelter, and the time-office moved to the main entrance. At the site of the old time-office a building has been erected for the proper care of foundry patterns. An additional oil-storage reservoir of 15,000 bbl. capacity was begun and is about completed. This will give a total oil storage of 40,000 barrels.

Mill Changes

In the concentrator, in section No. 1, ten roughing tables were installed on a gallery floor to increase the tonnage of this section. The old classifiers were replaced by four 5-compartment Steptoe hydraulic classifiers. This change has resulted in materially increased tonnage. In sections No. 5 and No. 6 two sets of 15 by 36-in. rolls have been installed in the fine-grinding department to replace the Huntington and Chilean mills of each section. This was found advisable after an experience of over a year in section No. 4, wherein it was found that fine-crushing rolls were giving a lower cost for fine grinding, without increased copper loss, over the Huntington mills. Four Wilfley tables were installed on the vanner floor in each of the eight sections, replacing the corrugated vanners formerly used for this purpose. The old vanners are being used for the treatment of the finer tailing, where the heavy losses are made. Twenty-four 6-ft. Craven canvas-belt slimers have been installed in section No. 1, and two Dorr thickeners have been installed in each of sections No. 6, 7, and 8. The repumping equipment has been increased by the installation of a 2000 gal. per minute volute pump, supplementing the 11 sec-ft. pumping engine. Five slime-settling ponds were excavated at the lower end of the mill to supply fresh water to this pumping plant.

Yield and Cost

The yield from all ore mined and treated, and from silicious carbonate ore delivered to the smelter, has amounted to 63,063,261 lb. of copper for the year 1912. The total cost per pound of copper has been 8.86c., and, deducting miscellaneous earnings, but including fund to cover improvements and depreciation, this is reduced to 8.33c. These costs include all possible charges, such as costs in Nevada, shipping, refining, marketing, legal expenses, taxes, New York and other expenses.

The increased cost per pound of copper has been due, first, to treatment of a lower grade of ore; second, to an increase in the costs the latter part of the year, due to strike conditions; third, to greater cost of mining, due to underground mining at the Veteran; fourth, to greater cost of ore obtained by the steam-shovel mining in the Liberty and Hecla pits, by reason of a greater proportion of redemption charges for stripping; and, fifth, to proportional increase in tonnage smelted, owing to a decreased ratio of concentration in the concentrator, due to an increased percentage of sulphide minerals in the ore.

Order for 1000-Cu. Yd. Barges

Requisitions have been forwarded to Washington by the Isthmian Canal Commisison for six dump barges with a capacity of 1000 cu. yd. each, to be used in connection with the 15-cu. yd. dipper dredges, recently contracted for with the Bucyrus Co. of South Milwaukee, Wisconsin. These barges are to be delivered at some Atlantic or Pacific port of the United States for towing to the Isthmus by January 1, 1914. They are to form part of the dredging equipment for use in emergency work in the Culebra cut section, and will be towed up the canal to the point required.

A Model Change Room

A new change room was made ready for service at the Miami mine the middle of April. The building, 50 by 90 ft., is made of steel and concrete, the walls being of steel frame, corrugated iron sides, and metal lath, lined with plaster. The floor is concreted. The equipment includes 100 shower baths and 823 lockers, and the whole is steam-heated and carefully ventilated.

West African mines production for March was as follows:

	Tonnage.	Yield.	Profit.
Abosso	8,700	$ 74,000	$12,000
Ashanti	11,393	180,000	75,000
Broomassie	2,960	58,000	10,000
Tarquah	5,490	72,000	21,000

Rand Practice in Deep Shaft-Sinking

By Charles B. Brodigan

*Actual sinking is only half the work of the completed shaft. It has to be timbered, guides have to be put in, it has to be plumbed, and launders for preventing water from reaching the bottom—a most important matter—have to be constructed. In fact, a host of things have to be done, and they must be done in the morning shift.

The timbermen come down with the sinkers to clean off and make good any damage done by the previous blast. Having done this, they then proceed to the surface and get ready for lowering all timber, tools, and tackle they require. If there is a great pressure of work, two of them will take blocks and wedges down with them and 'block' a set that is already filled in. They do not work in the compartments in which hoisting is proceeding, but confine their efforts to the ends and centre of the shaft. This extra work will not be necessary more than two or three times a week. On the other days their time will be occupied in getting ready to start serious work as soon as the shaft is cleared out. Then the procedure will be as follows. They will load the buckets up with end-plates, dividers, and studdles, with which to 'fill in' a hanging set; that is, two complete wall plates which are hanging by bolts from the last blocked set. 'Filling in' consists in placing the studdles, dividers, corner posts, and end-plates in position, and then screwing up the hanging bolts until the studdles are tight. The corner blocks are then put in, and by the aid of wedges and four plumb-bobs the set is carefully fixed in position parallel to and vertically under the sets already fixed.

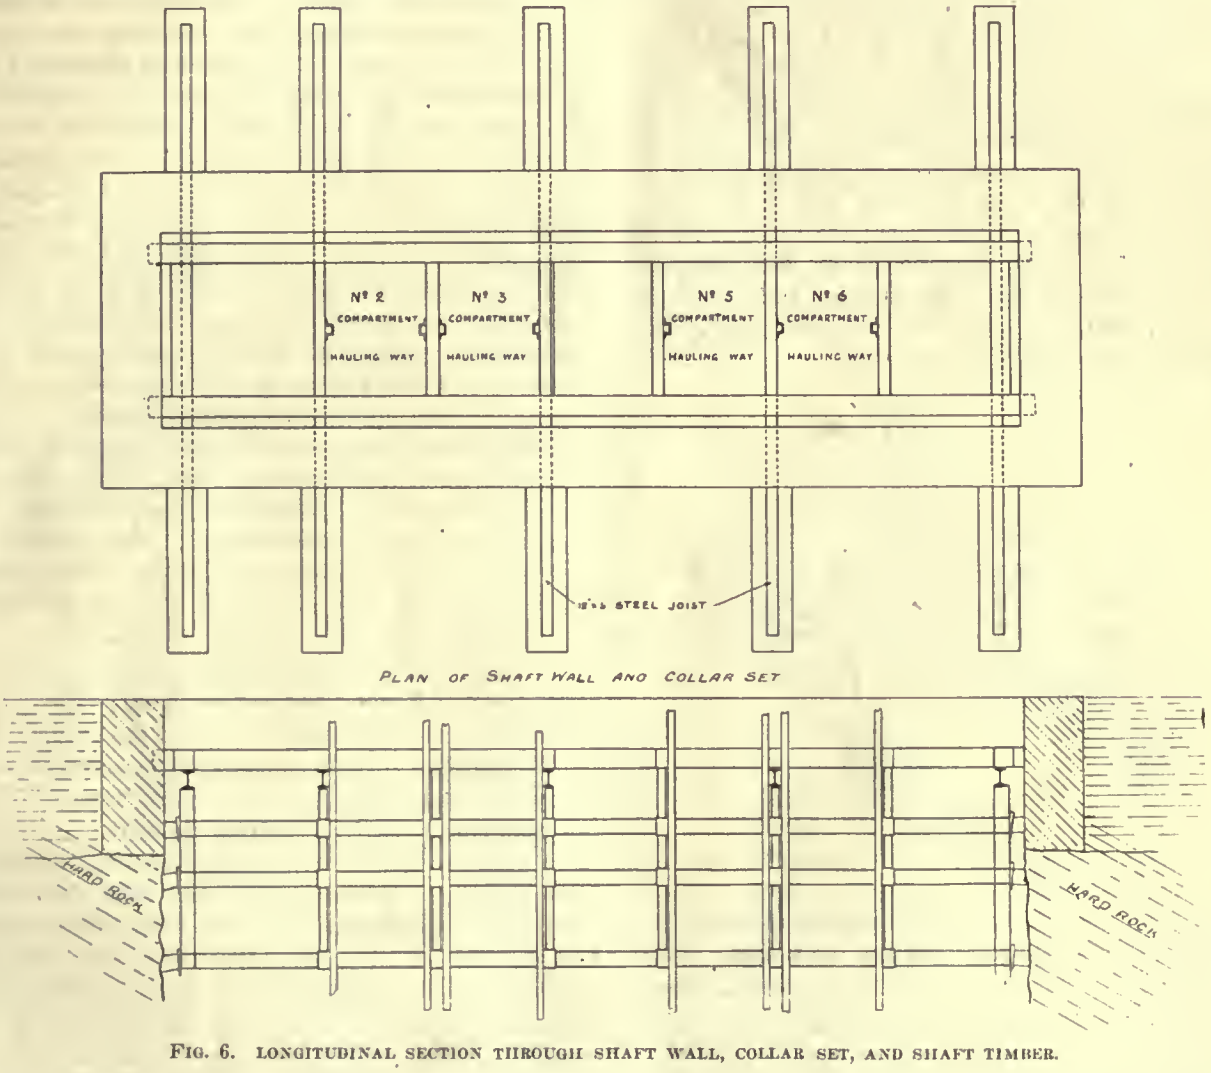


Fig. 6. Longitudinal section through shaft wall, collar set, and shaft timber.

To facilitate the plumbing of the sets, each wall plate has a vertical line mark cut into its face 6 in. from each corner, and this line must be wedged to coincide with a plumb-bob suspended from a corresponding position on a reference set, which is itself specially plumbed from the collar set once a month. The vertical alignment is secured from the same plumb-bobs. As soon as the ends are made fast, it is plain sailing to secure the set, blocks being firmly wedged opposite each divider.

There is one golden rule about fixing blocks in a shaft, namely, cut the blocks to suit the shape of the ground against which they will rest, and always wedge between the block and the wall plate, never between the block and the rock. Some authorities advocate giving the blocks a slight inclination up-

*Continued from page 614.

ward. The tendency should be slightly upward but only slightly. Give attention to having a good surface against which the block will rest, and then wedge both from above and below the wall plate, and satisfactory work will result. Too much insistence cannot be placed on the importance of good blocking. The success of a shaft depends entirely on the way in which it is blocked. If the work is not done in a satisfactory manner, rapid hauling can never be done in it, traveling in it will be a matter of danger, and constant repairs will be necessary.

Blocking the Timber

In every shaft the timber should be completely and adequately supported by the blocking. As an additional precaution to safeguard the shaft in case of bad blocking or bad ground which would not allow satisfactory blocking to be done, it is a universal practice to put in bearer sets at intervals of 100 to 150 ft. throughout the sinking. These bearers at the Brakpan were composed of strong baulks of timber 12 by 18 in. at the ends and 7 by 18 in. under the dividers. They are securely fixed in hitches cut in the sides of the shaft, and distance-pieces are fixed between the bearers and the ordinary wall plate to insure the bearers taking the weight in case of settlement.

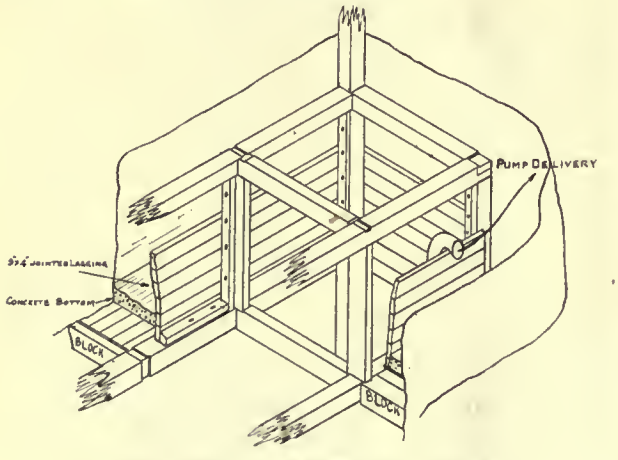

FIG. 7. PERSPECTIVE VIEW OF TIMBERING.

When the timbermen have finished blocking the set they have to prepare for the next day's work. This consists in lowering two, four, or sometimes six complete wall plates, suspending them by the hanging bolts from the blocked sets. This operation is performed in the following manner. The wall plate is suspended in a vertical position by a rope from the bottom of the bucket, and is then lowered to the bottom. Here the hanging bolts are inserted in the hole already bored to receive them. Two ring-bolts are also placed in the other two hanging-bolt holes. The wall plate is now swung into a horizontal position. While in this position, hooks from tackle suspended from blocked sets up the shaft are attached to the ring bolts and the wall plate is lifted clear of the rope and swung into the side of the shaft, from which position the hook of the hanging bolt can be hooked to bolts from the set above. The second engine must, of course, be used to hang the wall plates in the other section of the shaft. If rapid sinking is being done, it will be necessary to 'fill in' a set in addition to hanging two or three sets. This filled-in set will provide work that can be done during the clearing time.

The sizes of timber used in the shaft for making up the sets were as follows:

	Inches.		Inches.
Wall plates	9 by 9	End plates	9 by 9
Corner posts	8 by 8	Dividers	7 by 10
Studdles	12 by 4	Brattice	6 by 1¼

Handling Water

In sinking it is the rule, and not the exception, that at some period the even course of progress will be interrupted by an inrush of water, so it is well to describe the methods that are used to overcome the trouble. It is axiomatic that no rapid sinking can be achieved if there is water, even in small quantity, at the bottom of the shaft; so every endeavor must be made to get through the fissure as soon as possible and catch the water in a ring launder, constructed in the timbers. From such a ring the water can be bailed or pumped to the surface. To sink through water at all it is obvious that a pump will have to be provided, and as it would be impossible to equip with great Cornish lifts, as is done in the great colliery sinkings in the North of England, the engineer is practically restricted to reciprocating pumps actuated by compressed air. There is too much grit at the bottom to justify recommending the hanging centrifugal pumps.

Reciprocating pumps with a low lift must be used. Wherever good work has been done against difficulties with water, these pumps have been fixed on the timber in the end compartments. The timber in such cases is kept close to the bottom of the shaft. The pumps are kept at work right through the shift, and are provided with strong wire-bound suction, which can be quickly detached from the pumps and hoisted out of danger just before firing. The water which pours into the shaft as soon as the pump stops at blasting time acts as a cushion to the rock thrown up by the explosion. This in a great measure saves the pump and the timber from damage.

As soon as the blast is completed the pumpmen come down to the water-level and give the water mark to the engine-drivers, who forthwith proceed to bale with the engine which under such circumstances would be set aside for bailing purposes alone, until control is established. As soon as this is accomplished, the suction is attached to the pump and it is started, pumping to the ring launder, from which bailing may be resumed, leaving the bottom clear for the sinkers. The construction of these ring launders is evident from the isometric projection of one end of the shaft, given in Fig. 7.

Steel Guides Used

The guides used in the Brakpan shaft were made of mild steel and are known as Wood's slotted steel guides. The section of the guides can be seen in Fig. 6. They were selected because it was thought (1) they would provide a smooth running way for the skip; (2) that they would strengthen the whole shaft owing to the long length of steel tying the timbers together; (3) that accidents resulting from broken guides would be entirely prevented; (4) that the expense of upkeep would be less than with wooden

guides and there would be fewer interruptions.

They are much more expensive than wooden guides. In fact, for a shaft with four hauling-ways they cost £2 per foot of sinking more than wooden guides. I believe that in a truly vertical shaft they are worth the additional money, but it is a question of trial and experience, and before asserting positively that they are the best, I would prefer to await statistics relating to their wear at Brakpan. They have been used and condemned at other shafts, but the shafts were known to be notoriously out of true in vertical and horizontal direction; I cannot therefore accept the evidence as conclusive. Where acid water is present their use would be inadvisable.

Cost of the Work

A general summary of the items entering into the cost of the work is given below.

Cost of Temporary Plant

	£	s.	d.
Boiler-house	450	10	5
Engine-house	533	5	1
Boilers, including erection	4,304	12	8
Engines, including erection	4,634	9	0
Sundry offices and sheds	130	11	10
Change-houses	760	7	0
Headgear, including foundations	1,151	11	6
Signals	42	15	5
Pulleys	497	4	2
Ropes (for whole period of sinking)	1,324	1	0
Doors (safety and flap doors)	59	18	10
Kibbles and balling tanks	359	0	1
Cross-heads (for whole period of sinking)	234	7	1
General fittings	82	4	9
Painting	23	7	1
Chutes	54	6	11
Dismantling	143	15	4
	14,786	8	2

Supplies Consumed in Sinking Shaft No. 1

		Value. £	s.	d.
Gelatine, lb.	103,000	4,477	6	9
Detonators	114,000	135	4	8
Fuse, coils	59,167	1,373	15	11
Drill steel, lb.	65,834	949	3	3
Shovels	648	99	7	6
Picks	367	41	3	1
Hammers	796	69	16	9
Sundry tools		184	3	2
Carbide, cwt.	133	202	12	10
Paraffin, gal	1,805	106	17	10
Sundries, lamps, electric globes, etc.		151	7	5
Shaft sets, cu. ft.	44,000	11,513	9	10
Blocks, lagging, wedges	20,628	3,347	3	2
Bratticing, linear ft.	24,961	555	4	4
Guides	826	6,688	5	6
Hanging bolts, sets	452	1,297	17	1
Steel and iron, lb.	32,473	298	12	9
Sundries		347	16	6
		31,839	8	4

Complete Cost of Shafts

	Shaft No. 1. 3098 ft. to reef. 3129 ft. total depth. £	s.	d.	Shaft. No. 2. 3696 ft. to reef. 3777 ft. total depth. £	s.	d.
Sinking	53,277	13	10	57,244	4	5
Hoisting	7,524	2	6	11,753	4	8
Timber	36,023	14	2	43,249	3	9
Surface handling	4,215	13	10	5,703	2	3
Pumping and bailing	3,799	9	4	6,033	16	11
	104,840	13	8	123,983	12	0

Progress Record

During the process of sinking the two shafts a very satisfactory rate of sinking was maintained. Thus the hoist at No. 1 shaft started on September 26, 1905, the shaft being then 66 ft. deep, and the reef was reached at a depth of 3098 ft. on September 30, 1907, almost exactly two years from the start. This gives an average sinking of 126 ft. per month over the whole period. In No. 2 shaft scarcity of labor and delays in delivering the sinking equipment prevented the shaft being pushed until it had reached a depth of 1143 ft. From this point until the reef was reached at a depth of 3724 ft., an average rate of 152 ft. per month was maintained. The strange feature about the sinking was that the average rate of sinking increased with the depth of the shaft. The record for vertical shaft-sinking was beaten during the sinking of this shaft, and this record has since been handsomely beaten at both the Modder Deep and the State Mine. Both of these mines are situated in the immediate neighborhood of Brakpan. At the latter the first sod was cut on May 24, 1905, and the battery started on the same date six years afterward. During the period approximately £1,250,000 had been spent on the property.

As soon as the sinking of the shafts had been completed, the question of running the connection in dead ground, and with a difference in elevation of about 700 ft., had to be considered. F. G. A. Roberts gave the direction from a plumb-bob survey. The 4413-ft. connection between the two shafts was made, working from both ends, on lines derived from his survey of the two shafts, and the holing was within about ⅛ inch in both level and direction.

Machine v. Hand Drilling

It is constantly being urged upon one that there would be a great saving of labor if machine sinking was adopted. To show that this saving is unlikely, it is only necessary to describe the methods of machine sinking that have been used on the Rand.

Taking a shaft similar in size to the Brakpan shaft; that is an excavation of about 43 ft. by 9 ft. To drill over this area eight horizontal bars on which the machine drills would be fixed would be necessary. There would be a machine on each ordinary bar, probably two on the sump bars. White miners would be in charge of the machine on each bar, and they would be responsible for the drilling of six holes each. These holes would be at least 8 ft. deep. In fact, when the best footage was obtained the sump holes were put down about 14 ft. and the ordinary holes 12. To do this work the men had to stay down continuously at their work from 12 to 18 hours, depending on luck. The holes were then blasted and shovel boys sent down to clear away the stuff. Kaffir shovelers cannot work more than 8 hours at such arduous work, and it took at least 4 shifts of 8 hours each to remove the broken rock. During this long period water trickles to the bottom and cements the débris, rendering it difficult to shovel. Then, owing to the impossibility of conducting the perfect explosion of gelatine in such deep holes, second and third firing has to be done.

The upshot of the matter is the using of three shifts of boys for shoveling alone, who from the cementing of the stuff and the neeessity for re-blasting, are working under most disadvantageous conditions. As a result, it will be found that if the shoveling shifts alone were put to work under hammer sinking conditions they would almost attain the same footage as is obtained by the aid of machines. Further, eight white men are engaged in running the machines. These men must be paid an adequate wage, for shaft-sinking is dangerous work, although they only work about 17 shifts during the month. This is an extravagant way of using white labor. The greatest footage that has ever been attained in a vertieal shaft with maehine sinking is 168 ft. The eost eompared with hand sinking is prohibitive in this field.

There is one way in whieh maehines can be adapted to shaft-sinking with a reasonable hope of sueeess. It is to use small hammer machines with which boys could put in, say, four holes per shift. These boys would first have to elean out the stuff resulting from the previous blast and then drill the new round. In this way it would be possible to save about 30 boys per shift, and the work could be organized on the eight-hour basis, which in my opinion is the only unit of time that lends itself to satisfactory and economical sinking.

In conclusion, I will put before you the points both in favor of and against the rival systems of 'bucket' and 'skip' systems.

Use of Buckets

The following points favor the use of buckets:

1. Ease of handling in shaft. The bucket ean be easily detaehed from the rope and in eonsequence three buekets ean be used with eaeh engine. This feature makes for rapid sinking in depth, as the speed of elearing is rendered independent of depth; one bucket is being filled while the other is being hauled up the shaft.

2. It ean be tipped easily at the bottom. This is usefnl when loads of drills are taken down; they ean simply be tipped out upon the shaft bottom instead of having to take them out one by one as from a skip.

3. By their use the timbers can be kept 50 ft. away from the bottom; this in a great measure prevents the timber from being damaged by the blast.

4. The bueket can easily be removed in case of damage or in case a bailing skip has to be put on in a hurry.

There is one point against the bueket which outweighs all the others. It is the liability, which amounts to a eertainty, owing to the fact that the bueket hangs free below the eross-head, that it will swing in the shaft. This swinging may beeome so violent that the bucket strikes the timber and the eateher becomes disengaged, the bucket turns over, and the contents are spilled down the shaft. It is an extraordinary thing that although this has happened many times, it is rare indeed that any accident results, most of the falling stones being caught in the timbers. By the provision of the brattice partition down the centre of the shaft, any stones that fall clear of the timber are confined to one end of the shaft, so when the noise resulting from the stones falling is heard at the bottom, there is a rush of all the boys to the other side of the shaft; this fact has, of course, contributed to the smallness of the number of aeeidents resulting from this cause.

The Argument for Skips

The points in favor of skips are: (1) the skip is guided throughout its journey through the shaft and eannot vibrate or swing; (2) by virtue of this fact it ean be made of greater capacity than a bueket. This saves money be reducing the number of trips.

Against skips it may be urged that in order to secure the point that the skip must always run to gnides, it is necessary to carry a long slipper on the top of the skip which will bridge over the distance between the bottom of the shaft and the bottom blocked set. This distance eannot on the average be less than 15 ft. and is sometimes 20; therefore, the slipper is usually eonstrueted about 25 ft. loug. The slipper is of neeessity an awkward, heavy affair, that while effieient in seeuring the purpose of keeping the skip guided, has many disadvantages, not the least among which is the fact that it makes the skip awkward to shovel into. It is impossible to ehange skips at the bottom, so in deep sinking time will be lost owing to the fact that the natives cannot shovel during the hoisting period. To sum up. My opinion, based on experience, is that bueket sinking is, in average ground from 10 to 20 ft. per month faster than skip sinking. but the risks taken are greater.

Diesel Engines at Morenci

The power supply for the smelting plant of the Detroit Copper Mining Co. has been derived from a battery of Crossley gas engines, the gas being generated from eoal at the Detroit concentrator and transmitted in pipes across the hill. This plant having beeome somewhat antiquated, the gas engines are now to be replaeed by two 1000-hp., 2-eycle, 4-eylinder Diesel engines, made by Carels Frères, of Ghent, Belgium. These will be direct connected to 60-eycle alternators, operating in parallel, and are guaranteed to deliver 1000 hp. each, at an elevation of 6500 ft, using not to exeeed 0.48 gal. oil per boiler horse-power hour.
